- Disable the ADC end of conversion

interrupt.

**Parameters:**

- `__HANDLE__`: ADC handle
- `__INTERRUPT__`: ADC Interrupt This parameter can be any combination of the following values:
  - `SDADC_IT_EOCAL`: End of calibration interrupt enable
  - `SDADC_IT_JEOC`: Injected end of conversion interrupt enable
  - `SDADC_IT_JOVR`: Injected data overrun interrupt enable
  - `SDADC_IT_ROEC`: Regular end of conversion interrupt enable
  - `SDADC_IT_ROVR`: Regular data overrun interrupt enable

**Return value:**

- None

`__HAL_SDADC_GET_IT_SOURCE`

**Description:**

- Checks if the specified ADC interrupt source is enabled or disabled.

**Parameters:**

- `__HANDLE__`: ADC handle
- `__INTERRUPT__`: ADC interrupt source to check This parameter can be any combination of the following values:
  - `SDADC_IT_EOCAL`: End of calibration interrupt enable
  - `SDADC_IT_JEOC`: Injected end of conversion interrupt enable
  - `SDADC_IT_JOVR`: Injected data overrun interrupt enable
  - `SDADC_IT_ROEC`: Regular end of conversion interrupt enable
  - `SDADC_IT_ROVR`: Regular data overrun interrupt enable

**Return value:**

- State: of interruption (SET or RESET)

`__HAL_SDADC_GET_FLAG`

**Description:**

- Get the selected ADC's flag status.

**Parameters:**

- `__HANDLE__`: ADC handle
- `__FLAG__`: ADC flag This parameter can be any combination of the following values:
  - `SDADC_FLAG_EOCAL`: End of calibration flag

- SDADC\_FLAG\_JEOC: End of injected conversion flag
- SDADC\_FLAG\_JOVR: Injected conversion overrun flag
- SDADC\_FLAG\_REOC: End of regular conversion flag
- SDADC\_FLAG\_ROVR: Regular conversion overrun flag

**Return value:**

- None

`_HAL_SDADC_CLEAR_FLAG`**Description:**

- Clear the ADC's pending flags.

**Parameters:**

- `_HANDLE_`: ADC handle
- `_FLAG_`: ADC flag This parameter can be any combination of the following values:
  - SDADC\_FLAG\_EOCAL: End of calibration flag
  - SDADC\_FLAG\_JEOC: End of injected conversion flag
  - SDADC\_FLAG\_JOVR: Injected conversion overrun flag
  - SDADC\_FLAG\_REOC: End of regular conversion flag
  - SDADC\_FLAG\_ROVR: Regular conversion overrun flag

**Return value:**

- None

`_HAL_SDADC_RESET_HANDLE_STATE`**Description:**

- Reset SDADC handle state.

**Parameters:**

- `_HANDLE_`: SDADC handle.

**Return value:**

- None

***SDADC External Trigger Edge***

|                                          |                                   |
|------------------------------------------|-----------------------------------|
| <code>SDADC_EXT_TRIG_RISING_EDGE</code>  | External rising edge              |
| <code>SDADC_EXT_TRIG_FALLING_EDGE</code> | External falling edge             |
| <code>SDADC_EXT_TRIG_BOTH_EDGES</code>   | External rising and falling edges |

***SDADC Fast Conversion Mode***

|                                      |
|--------------------------------------|

| SDADC_EXT_TRIG_TIM16_CC1 | Trigger source for SDADC3 |
| SDADC_EXT_TRIG_TIM17_CC1 | Trigger source for SDADC2 |
| SDADC_EXT_TRIG_TIM12_CC1 | Trigger source for SDADC2 |
| SDADC_EXT_TRIG_TIM12_CC2 | Trigger source for SDADC3 |
| SDADC_EXT_TRIG_TIM15_CC2 | Trigger source for SDADC1 |
| SDADC_EXT_TRIG_TIM2_CC3  | Trigger source for SDADC2 |
| SDADC_EXT_TRIG_TIM2_CC4  | Trigger source for SDADC3 |
| SDADC_EXT_TRIG_TIM3_CC1  | Trigger source for SDADC1 |
| SDADC_EXT_TRIG_TIM3_CC2  | Trigger source for SDADC2 |
| SDADC_EXT_TRIG_TIM3_CC3  | Trigger source for SDADC3 |
| SDADC_EXT_TRIG_TIM4_CC1  | Trigger source for SDADC1 |
| SDADC_EXT_TRIG_TIM4_CC2  | Trigger source for SDADC2 |

|                                    |                                                                   |
|------------------------------------|-------------------------------------------------------------------|
| SDADC_EXT_TRIG_TIM4_CC3            | Trigger source for SDADC3                                         |
| SDADC_EXT_TRIG_TIM19_CC2           | Trigger source for SDADC1                                         |
| SDADC_EXT_TRIG_TIM19_CC3           | Trigger source for SDADC2                                         |
| SDADC_EXT_TRIG_TIM19_CC4           | Trigger source for SDADC3                                         |
| SDADC_EXT_TRIG EXTI11              | Trigger source for SDADC1, SDADC2 and SDADC3                      |
| SDADC_EXT_TRIG EXTI15              | Trigger source for SDADC1, SDADC2 and SDADC3                      |
| <b>SDADC Input Mode</b>            |                                                                   |
| SDADC_INPUT_MODE_DIFF              | Conversions are executed in differential mode                     |
| SDADC_INPUT_MODE_SE_OFFSET         | Conversions are executed in single ended offset mode              |
| SDADC_INPUT_MODE_SE_ZERO_REFERENCE | Conversions are executed in single ended zero-volt reference mode |
| <b>SDADC interrupts definition</b> |                                                                   |
| SDADC_IT_EOCAL                     | End of calibration interrupt enable                               |
| SDADC_IT_JEOC                      | Injected end of conversion interrupt enable                       |
| SDADC_IT_JOVR                      | Injected data overrun interrupt enable                            |
| SDADC_IT_REOC                      | Regular end of conversion interrupt enable                        |
| SDADC_IT_ROVR                      | Regular data overrun interrupt enable                             |
| <b>SDADC Multimode Type</b>        |                                                                   |
| SDADC_MULTIMODE_SDADC1_SDADC2      | Get conversion values for SDADC1 and SDADC2                       |
| SDADC_MULTIMODE_SDADC1_SDADC3      | Get conversion values for SDADC1 and SDADC3                       |
| <b>SDADC Reference Voltage</b>     |                                                                   |
| SDADC_VREF_EXT                     | The reference voltage is forced externally using VREF pin         |
| SDADC_VREF_VREFINT1                | The reference voltage is forced internally to 1.22V VREFINT       |
| SDADC_VREF_VREFINT2                | The reference voltage is forced internally to 1.8V VREFINT        |
| SDADC_VREF_VDDA                    | The reference voltage is forced internally to VDDA                |
| <b>SDADC Slow Clock Mode</b>       |                                                                   |
| SDADC_SLOW_CLOCK_DISABLE           |                                                                   |
| SDADC_SLOW_CLOCK_ENABLE            |                                                                   |
| <b>SDADC Trigger</b>               |                                                                   |
| SDADC_SOFTWARE_TRIGGER             | Software trigger                                                  |
| SDADC_SYNCHRONOUS_TRIGGER          | Synchronous with SDADC1 (only for SDADC2 and SDADC3)              |
| SDADC_EXTERNAL_TRIGGER             | External trigger                                                  |

## 45 HAL SMARTCARD Generic Driver

### 45.1 SMARTCARD Firmware driver registers structures

#### 45.1.1 SMARTCARD\_InitTypeDef

##### Data Fields

- *uint32\_t BaudRate*
- *uint32\_t WordLength*
- *uint32\_t StopBits*
- *uint16\_t Parity*
- *uint16\_t Mode*
- *uint16\_t CLKPolarity*
- *uint16\_t CLKPhase*
- *uint16\_t CLKLastBit*
- *uint16\_t OneBitSampling*
- *uint8\_t Prescaler*
- *uint8\_t GuardTime*
- *uint16\_t NACKEnable*
- *uint32\_t TimeOutEnable*
- *uint32\_t TimeOutValue*
- *uint8\_t BlockLength*
- *uint8\_t AutoRetryCount*

##### Field Documentation

- ***uint32\_t SMARTCARD\_InitTypeDef::BaudRate***  
Configures the SmartCard communication baud rate. The baud rate register is computed using the following formula: Baud Rate Register = ((PCLKx) / ((hsmcard->Init.BaudRate)))
- ***uint32\_t SMARTCARD\_InitTypeDef::WordLength***  
Specifies the number of data bits transmitted or received in a frame. This parameter ***SMARTCARD\_Word\_Length*** can only be set to 9 (8 data + 1 parity bits).
- ***uint32\_t SMARTCARD\_InitTypeDef::StopBits***  
Specifies the number of stop bits. This parameter can be a value of ***SMARTCARD\_Stop\_Bits***.
- ***uint16\_t SMARTCARD\_InitTypeDef::Parity***  
Specifies the parity mode. This parameter can be a value of ***SMARTCARD\_Parity***  
**Note:**The parity is enabled by default (PCE is forced to 1U). Since the WordLength is forced to 8 bits + parity, M is forced to 1 and the parity bit is the 9th bit.
- ***uint16\_t SMARTCARD\_InitTypeDef::Mode***  
Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of ***SMARTCARD\_Mode***
- ***uint16\_t SMARTCARD\_InitTypeDef::CLKPolarity***  
Specifies the steady state of the serial clock. This parameter can be a value of ***SMARTCARD\_Clock\_Polarity***
- ***uint16\_t SMARTCARD\_InitTypeDef::CLKPhase***  
Specifies the clock transition on which the bit capture is made. This parameter can be a value of ***SMARTCARD\_Clock\_Phase***
- ***uint16\_t SMARTCARD\_InitTypeDef::CLKLastBit***  
Specifies whether the clock pulse corresponding to the last transmitted data bit (MSB)

- has to be output on the SCLK pin in synchronous mode. This parameter can be a value of [\*\*SMARTCARD\\_Last\\_Bit\*\*](#).
- **`uint16_t SMARTCARD_InitTypeDef::OneBitSampling`**  
Specifies whether a single sample or three samples' majority vote is selected. Selecting the single sample method increases the receiver tolerance to clock deviations. This parameter can be a value of [\*\*SMARTCARD\\_OneBit\\_Sampling\*\*](#).
  - **`uint8_t SMARTCARD_InitTypeDef::Prescaler`**  
Specifies the SmartCard Prescaler.
  - **`uint8_t SMARTCARD_InitTypeDef::GuardTime`**  
Specifies the SmartCard Guard Time applied after stop bits.
  - **`uint16_t SMARTCARD_InitTypeDef::NACKEnable`**  
Specifies whether the SmartCard NACK transmission is enabled in case of parity error. This parameter can be a value of [\*\*SMARTCARD\\_NACK\\_Enable\*\*](#).
  - **`uint32_t SMARTCARD_InitTypeDef::TimeOutEnable`**  
Specifies whether the receiver timeout is enabled. This parameter can be a value of [\*\*SMARTCARD\\_Timeout\\_Enable\*\*](#).
  - **`uint32_t SMARTCARD_InitTypeDef::TimeOutValue`**  
Specifies the receiver time out value in number of baud blocks: it is used to implement the Character Wait Time (CWT) and Block Wait Time (BWT). It is coded over 24 bits.
  - **`uint8_t SMARTCARD_InitTypeDef::BlockLength`**  
Specifies the SmartCard Block Length in T=1 Reception mode. This parameter can be any value from 0x0 to 0xFFU.
  - **`uint8_t SMARTCARD_InitTypeDef::AutoRetryCount`**  
Specifies the SmartCard auto-retry count (number of retries in receive and transmit mode). When set to 0U, retransmission is disabled. Otherwise, its maximum value is 7 (before signalling an error).

#### 45.1.2 **SMARTCARD\_AdvFeatureInitTypeDef**

##### Data Fields

- **`uint32_t AdvFeatureInit`**
- **`uint32_t TxPinLevelInvert`**
- **`uint32_t RxPinLevelInvert`**
- **`uint32_t DataInvert`**
- **`uint32_t Swap`**
- **`uint32_t OverrunDisable`**
- **`uint32_t DMADisableonRxError`**
- **`uint32_t MSBFirst`**

##### Field Documentation

- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::AdvFeatureInit`**  
Specifies which advanced SMARTCARD features is initialized. Several advanced features may be initialized at the same time. This parameter can be a value of [\*\*SMARTCARD\\_Advanced\\_Features\\_Initialization\\_Type\*\*](#).
- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::TxPinLevelInvert`**  
Specifies whether the TX pin active level is inverted. This parameter can be a value of [\*\*SMARTCARD\\_Tx\\_Inv\*\*](#).
- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::RxPinLevelInvert`**  
Specifies whether the RX pin active level is inverted. This parameter can be a value of [\*\*SMARTCARD\\_Rx\\_Inv\*\*](#).
- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::DataInvert`**  
Specifies whether data are inverted (positive/direct logic vs negative/inverted logic). This parameter can be a value of [\*\*SMARTCARD\\_Data\\_Inv\*\*](#).

- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::Swap`**  
Specifies whether TX and RX pins are swapped. This parameter can be a value of `SMARTCARD_Rx_Tx_Swap`
- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::OverrunDisable`**  
Specifies whether the reception overrun detection is disabled. This parameter can be a value of `SMARTCARD_Overrun_Disable`
- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::DMADisableonRxError`**  
Specifies whether the DMA is disabled in case of reception error. This parameter can be a value of `SMARTCARD_DMA_Disable_on_Rx_Error`
- **`uint32_t SMARTCARD_AdvFeatureInitTypeDef::MSBFirst`**  
Specifies whether MSB is sent first on UART line. This parameter can be a value of `SMARTCARD_MSB_First`

### 45.1.3 SMARTCARD\_HandleTypeDef

#### Data Fields

- `USART_TypeDef * Instance`
- `SMARTCARD_InitTypeDef Init`
- `SMARTCARD_AdvFeatureInitTypeDef AdvancedInit`
- `uint8_t * pTxBuffPtr`
- `uint16_t TxXferSize`
- `_IO uint16_t TxXferCount`
- `uint8_t * pRxBuffPtr`
- `uint16_t RxXferSize`
- `_IO uint16_t RxXferCount`
- `DMA_HandleTypeDef * hdmatx`
- `DMA_HandleTypeDef * hdmarx`
- `HAL_LockTypeDef Lock`
- `_IO HAL_SMARTCARD_StateTypeDef gState`
- `_IO HAL_SMARTCARD_StateTypeDef RxState`
- `_IO uint32_t ErrorCode`

#### Field Documentation

- **`USART_TypeDef* SMARTCARD_HandleTypeDef::Instance`**  
USART registers base address
- **`SMARTCARD_InitTypeDef SMARTCARD_HandleTypeDef::Init`**  
SmartCard communication parameters
- **`SMARTCARD_AdvFeatureInitTypeDef SMARTCARD_HandleTypeDef::AdvancedInit`**  
SmartCard advanced features initialization parameters
- **`uint8_t* SMARTCARD_HandleTypeDef::pTxBuffPtr`**  
Pointer to SmartCard Tx transfer Buffer
- **`uint16_t SMARTCARD_HandleTypeDef::TxXferSize`**  
SmartCard Tx Transfer size
- **`_IO uint16_t SMARTCARD_HandleTypeDef::TxXferCount`**  
SmartCard Tx Transfer Counter
- **`uint8_t* SMARTCARD_HandleTypeDef::pRxBuffPtr`**  
Pointer to SmartCard Rx transfer Buffer
- **`uint16_t SMARTCARD_HandleTypeDef::RxXferSize`**  
SmartCard Rx Transfer size
- **`_IO uint16_t SMARTCARD_HandleTypeDef::RxXferCount`**  
SmartCard Rx Transfer Counter
- **`DMA_HandleTypeDef* SMARTCARD_HandleTypeDef::hdmatx`**  
SmartCard Tx DMA Handle parameters

- **DMA\_HandleTypeDef\* SMARTCARD\_HandleTypeDef::hdmarx**  
SmartCard Rx DMA Handle parameters
- **HAL\_LockTypeDef SMARTCARD\_HandleTypeDef::Lock**  
Locking object
- **\_IO HAL\_SMARTCARD\_StateTypeDef SMARTCARD\_HandleTypeDef::gState**  
SmartCard state information related to global Handle management and also related to Tx operations. This parameter can be a value of **HAL\_SMARTCARD\_StateTypeDef**
- **\_IO HAL\_SMARTCARD\_StateTypeDef SMARTCARD\_HandleTypeDef::RxState**  
SmartCard state information related to Rx operations. This parameter can be a value of **HAL\_SMARTCARD\_StateTypeDef**
- **\_IO uint32\_t SMARTCARD\_HandleTypeDef::ErrorCode**  
SmartCard Error code This parameter can be a value of **SMARTCARD\_Error**

## 45.2 SMARTCARD Firmware driver API description

### 45.2.1 How to use this driver

The SMARTCARD HAL driver can be used as follows:

1. Declare a SMARTCARD\_HandleTypeDef handle structure (eg. SMARTCARD\_HandleTypeDef hsmartcard).
2. Associate a USART to the SMARTCARD handle hsmartcard.
3. Initialize the SMARTCARD low level resources by implementing the HAL\_SMARTCARD\_MspInit() API:
  - Enable the USARTx interface clock.
  - USART pins configuration:
    - Enable the clock for the USART GPIOs.
    - Configure the USART pins (TX as alternate function pull-up, RX as alternate function Input).
  - NVIC configuration if you need to use interrupt process (HAL\_SMARTCARD\_Transmit\_IT() and HAL\_SMARTCARD\_Receive\_IT() APIs):
    - Configure the USARTx interrupt priority.
    - Enable the NVIC USART IRQ handle.
  - DMA Configuration if you need to use DMA process (HAL\_SMARTCARD\_Transmit\_DMA() and HAL\_SMARTCARD\_Receive\_DMA() APIs):
    - Declare a DMA handle structure for the Tx/Rx channel.
    - Enable the DMAx interface clock.
    - Configure the declared DMA handle structure with the required Tx/Rx parameters.
    - Configure the DMA Tx/Rx channel.
    - Associate the initialized DMA handle to the SMARTCARD DMA Tx/Rx handle.
    - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
4. Program the Baud Rate, Parity, Mode(Receiver/Transmitter), clock enabling/disabling and accordingly, the clock parameters (parity, phase, last bit), prescaler value, guard time and NACK on transmission error enabling or disabling in the hsmartcard handle Init structure.
5. If required, program SMARTCARD advanced features (TX/RX pins swap, TimeOut, auto-retry counter,...) in the hsmartcard handle AdvancedInit structure.
6. Initialize the SMARTCARD registers by calling the HAL\_SMARTCARD\_Init() API:
  - This API configures also the low level Hardware (GPIO, CLOCK, CORTEX...etc) by calling the customized HAL\_SMARTCARD\_MspInit() API.

The specific SMARTCARD interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros `_HAL_SMARTCARD_ENABLE_IT()` and `_HAL_SMARTCARD_DISABLE_IT()` inside the transmit and receive process.

Three operation modes are available within this driver :

### **Polling mode IO operation**

- Send an amount of data in blocking mode using `HAL_SMARTCARD_Transmit()`
- Receive an amount of data in blocking mode using `HAL_SMARTCARD_Receive()`

### **Interrupt mode IO operation**

- Send an amount of data in non-blocking mode using `HAL_SMARTCARD_Transmit_IT()`
- At transmission end of transfer `HAL_SMARTCARD_TxCpltCallback()` is executed and user can add his own code by customization of function pointer `HAL_SMARTCARD_TxCpltCallback()`
- Receive an amount of data in non-blocking mode using `HAL_SMARTCARD_Receive_IT()`
- At reception end of transfer `HAL_SMARTCARD_RxCpltCallback()` is executed and user can add his own code by customization of function pointer `HAL_SMARTCARD_RxCpltCallback()`
- In case of transfer Error, `HAL_SMARTCARD_ErrorCallback()` function is executed and user can add his own code by customization of function pointer `HAL_SMARTCARD_ErrorCallback()`

### **DMA mode IO operation**

- Send an amount of data in non-blocking mode (DMA) using `HAL_SMARTCARD_Transmit_DMA()`
- At transmission end of transfer `HAL_SMARTCARD_TxCpltCallback()` is executed and user can add his own code by customization of function pointer `HAL_SMARTCARD_TxCpltCallback()`
- Receive an amount of data in non-blocking mode (DMA) using `HAL_SMARTCARD_Receive_DMA()`
- At reception end of transfer `HAL_SMARTCARD_RxCpltCallback()` is executed and user can add his own code by customization of function pointer `HAL_SMARTCARD_RxCpltCallback()`
- In case of transfer Error, `HAL_SMARTCARD_ErrorCallback()` function is executed and user can add his own code by customization of function pointer `HAL_SMARTCARD_ErrorCallback()`

### **SMARTCARD HAL driver macros list**

Below the list of most used macros in SMARTCARD HAL driver.

- `_HAL_SMARTCARD_GET_FLAG` : Check whether or not the specified SMARTCARD flag is set
- `_HAL_SMARTCARD_CLEAR_FLAG` : Clear the specified SMARTCARD pending flag
- `_HAL_SMARTCARD_ENABLE_IT`: Enable the specified SMARTCARD interrupt
- `_HAL_SMARTCARD_DISABLE_IT`: Disable the specified SMARTCARD interrupt

- `_HAL_SMARTCARD_GET_IT_SOURCE`: Check whether or not the specified SMARTCARD interrupt is enabled

You can refer to the SMARTCARD HAL driver header file for more useful macros

## 45.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USARTx associated to the SmartCard.

The Smartcard interface is designed to support asynchronous protocol Smartcards as defined in the ISO 7816-3 standard.

The USART can provide a clock to the smartcard through the SCLK output. In smartcard mode, SCLK is not associated to the communication but is simply derived from the internal peripheral input clock through a 5-bit prescaler.

- These parameters can be configured:
  - Baud Rate
  - Parity: should be enabled
  - Receiver/transmitter modes
  - Synchronous mode (and if enabled, phase, polarity and last bit parameters)
  - Prescaler value
  - Guard bit time
  - NACK enabling or disabling on transmission error
- The following advanced features can be configured as well:
  - TX and/or RX pin level inversion
  - data logical level inversion
  - RX and TX pins swap
  - RX overrun detection disabling
  - DMA disabling on RX error
  - MSB first on communication line
  - Time out enabling (and if activated, timeout value)
  - Block length
  - Auto-retry counter

The `HAL_SMARTCARD_Init()` API follows the USART synchronous configuration procedures (details for the procedures are available in reference manual).

This section contains the following APIs:

- [`HAL\_SMARTCARD\_Init\(\)`](#)
- [`HAL\_SMARTCARD\_DelInit\(\)`](#)
- [`HAL\_SMARTCARD\_MspInit\(\)`](#)
- [`HAL\_SMARTCARD\_MspDelInit\(\)`](#)

## 45.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the SMARTCARD data transfers.

Smartcard is a single wire half duplex communication protocol. The Smartcard interface is designed to support asynchronous protocol Smartcards as defined in the ISO 7816-3 standard. The USART should be configured as:

- 8 bits plus parity: where M=1 and PCE=1 in the USART\_CR1 register
  - 1.5 stop bits when transmitting and receiving: where STOP=11 in the USART\_CR2 register.
1. There are two modes of transfer:
    - Blocking mode: The communication is performed in polling mode. The HAL status of all data processing is returned by the same function after finishing transfer.
    - Non-Blocking mode: The communication is performed using Interrupts or DMA, the relevant API's return the HAL status. The end of the data processing will be indicated through the dedicated SMARTCARD IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
    - The HAL\_SMARTCARD\_TxCpltCallback(), HAL\_SMARTCARD\_RxCpltCallback() user callbacks will be executed respectively at the end of the Transmit or Receive process. The HAL\_SMARTCARD\_ErrorCallback() user callback will be executed when a communication error is detected.
  2. Blocking mode APIs are :
    - HAL\_SMARTCARD\_Transmit()
    - HAL\_SMARTCARD\_Receive()
  3. Non Blocking mode APIs with Interrupt are :
    - HAL\_SMARTCARD\_Transmit\_IT()
    - HAL\_SMARTCARD\_Receive\_IT()
    - HAL\_SMARTCARD\_IRQHandler()
  4. Non Blocking mode functions with DMA are :
    - HAL\_SMARTCARD\_Transmit\_DMA()
    - HAL\_SMARTCARD\_Receive\_DMA()
  5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
    - HAL\_SMARTCARD\_TxCpltCallback()
    - HAL\_SMARTCARD\_RxCpltCallback()
    - HAL\_SMARTCARD\_ErrorCallback()
  6. Non-Blocking mode transfers could be aborted using Abort API's :
    - HAL\_SMARTCARD\_Abort()
    - HAL\_SMARTCARD\_AbortTransmit()
    - HAL\_SMARTCARD\_AbortReceive()
    - HAL\_SMARTCARD\_Abort\_IT()
    - HAL\_SMARTCARD\_AbortTransmit\_IT()
    - HAL\_SMARTCARD\_AbortReceive\_IT()
  7. For Abort services based on interrupts (HAL\_SMARTCARD\_Abortxxx\_IT), a set of Abort Complete Callbacks are provided:
    - HAL\_SMARTCARD\_AbortCpltCallback()
    - HAL\_SMARTCARD\_AbortTransmitCpltCallback()
    - HAL\_SMARTCARD\_AbortReceiveCpltCallback()
  8. In Non-Blocking mode transfers, possible errors are split into 2 categories. Errors are handled as follows :
    - Error is considered as Recoverable and non blocking : Transfer could go till end, but error severity is to be evaluated by user : this concerns Frame Error, Parity Error or Noise Error in Interrupt mode reception . Received character is then retrieved and stored in Rx buffer, Error code is set to allow user to identify error type, and HAL\_SMARTCARD\_ErrorCallback() user callback is executed.  
Transfer is kept ongoing on SMARTCARD side. If user wants to abort it, Abort services should be called by user.
    - Error is considered as Blocking : Transfer could not be completed properly and is aborted. This concerns Frame Error in Interrupt mode transmission, Overrun Error in Interrupt mode reception and all errors in DMA mode. Error code is set to allow

user to identify error type, and HAL\_SMARTCARD\_ErrorCallback() user callback is executed.

This section contains the following APIs:

- [`HAL\_SMARTCARD\_Transmit\(\)`](#)
- [`HAL\_SMARTCARD\_Receive\(\)`](#)
- [`HAL\_SMARTCARD\_Transmit\_IT\(\)`](#)
- [`HAL\_SMARTCARD\_Receive\_IT\(\)`](#)

- [`HAL\_SMARTCARD\_AbortCpltCallback\(\)`](#)
- [`HAL\_SMARTCARD\_AbortTransmitCpltCallback\(\)`](#)
- [`HAL\_SMARTCARD\_AbortReceiveCpltCallback\(\)`](#)

#### 45.2.4 Peripheral State and Errors functions

This subsection provides a set of functions allowing to return the State of SmartCard handle and also return Peripheral Errors occurred during communication process

- `HAL_SMARTCARD_GetState()` API can be helpful to check in run-time the state of the SMARTCARD peripheral.
- `HAL_SMARTCARD_GetError()` checks in run-time errors that could occur during communication.

This section contains the following APIs:

- [`HAL\_SMARTCARD\_GetState\(\)`](#)
- [`HAL\_SMARTCARD\_GetError\(\)`](#)

#### 45.2.5 Detailed description of functions

##### `HAL_SMARTCARD_Init`

|                      |                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 45.3 SMARTCARD Firmware driver defines

### 45.3.1 SMARTCARD

#### ***SMARTCARD advanced feature initialization type***

|                                             |                                          |
|---------------------------------------------|------------------------------------------|
| SMARTCARD_ADVFEATURE_NO_INIT                | No advanced feature initialization       |
| SMARTCARD_ADVFEATURE_TXINVERT_INIT          | TX pin active level inversion            |
| SMARTCARD_ADVFEATURE_RXINVERT_INIT          | RX pin active level inversion            |
| SMARTCARD_ADVFEATURE_DATAINVERT_INIT        | Binary data inversion                    |
| SMARTCARD_ADVFEATURE_SWAP_INIT              | TX/RX pins swap                          |
| SMARTCARD_ADVFEATURE_RXOVERRUNDISABLE_INIT  | RX overrun disable                       |
| SMARTCARD_ADVFEATURE_DMADISABLEONERROR_INIT | DMA disable on Reception Error           |
| SMARTCARD_ADVFEATURE_MSBFIRST_INIT          | Most significant bit sent/received first |

#### ***SMARTCARD Clock Phase***

|                       |                                                  |
|-----------------------|--------------------------------------------------|
| SMARTCARD_PHASE_1EDGE | SMARTCARD frame phase on first clock transition  |
| SMARTCARD_PHASE_2EDGE | SMARTCARD frame phase on second clock transition |

#### ***SMARTCARD Clock Polarity***

|                         |                               |
|-------------------------|-------------------------------|
| SMARTCARD_POLARITY_LOW  | SMARTCARD frame low polarity  |
| SMARTCARD_POLARITY_HIGH | SMARTCARD frame high polarity |

#### ***SMARTCARD auto retry counter LSB position in CR3 register***

|                               |                                                           |
|-------------------------------|-----------------------------------------------------------|
| SMARTCARD_CR3_SCARCNT_LSB_POS | SMARTCARD auto retry counter LSB position in CR3 register |
|-------------------------------|-----------------------------------------------------------|

#### ***SMARTCARD advanced feature Binary Data inversion***

|                                      |                               |
|--------------------------------------|-------------------------------|
| SMARTCARD_ADVFEATURE_DATAINV_DISABLE | Binary data inversion disable |
| SMARTCARD_ADVFEATURE_DATAINV_ENABLE  | Binary data inversion enable  |

#### ***SMARTCARD advanced feature DMA Disable on Rx Error***

|                                           |                                |
|-------------------------------------------|--------------------------------|
| SMARTCARD_ADVFEATURE_DMA_ENABLEONRXERROR  | DMA enable on Reception Error  |
| SMARTCARD_ADVFEATURE_DMA_DISABLEONRXERROR | DMA disable on Reception Error |

#### ***SMARTCARD Error***

|                          |              |
|--------------------------|--------------|
| HAL_SMARTCARD_ERROR_NONE | No error     |
| HAL_SMARTCARD_ERROR_PE   | Parity error |
| HAL_SMARTCARD_ERROR_NE   | Noise error  |
| HAL_SMARTCARD_ERROR_FE   | frame error  |

---

|                                      |                        |
|--------------------------------------|------------------------|
| <code>HAL_SMARTCARD_ERROR_ORE</code> | Overrun error          |
| <code>HAL_SMARTCARD_ERROR_DMA</code> | DMA transfer error     |
| <code>HAL_SMARTCARD_ERROR_RTO</code> | Receiver TimeOut error |

***SMARTCARD Exported Macros***

`__HAL_SMARTCARD_RESET_HANDLE_STATE`

**Description:**

- Reset SMARTCARD handle states.

**Parameters:**

- `__HANDLE__`: SMARTCARD handle.

**Return value:**

- None

`__HAL_SMARTCARD_FLUSH_DRREGISTER`

**Description:**

- Flush the Smartcard Data registers.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.

**Return value:**

- None

`__HAL_SMARTCARD_CLEAR_FLAG`

**Description:**

- Clear the specified SMARTCARD pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.
- `__FLAG__`: specifies the flag to check. This parameter can be any combination of the following values:
  - `SMARTCARD_CLEAR_PEF` Parity error clear flag
  - `SMARTCARD_CLEAR_FEF` Framing error clear flag
  - `SMARTCARD_CLEAR_NEF` Noise detected clear flag
  - `SMARTCARD_CLEAR_OREF` OverRun error clear flag
  - `SMARTCARD_CLEAR_IDLEF` Idle line detected clear flag
  - `SMARTCARD_CLEAR_TCF` Transmission complete clear flag
  - `SMARTCARD_CLEAR_RTOF` Receiver timeout clear flag
  - `SMARTCARD_CLEAR_EOBF` End of block clear flag

**Return value:**

- None

`__HAL_SMARTCARD_CLEAR_PE  
FLAG`

**Description:**

- Clear the SMARTCARD PE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.

**Return value:**

- None

`__HAL_SMARTCARD_CLEAR_FE  
FLAG`

**Description:**

- Clear the SMARTCARD FE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.

**Return value:**

- None

`__HAL_SMARTCARD_CLEAR_NE  
FLAG`

**Description:**

- Clear the SMARTCARD NE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.

**Return value:**

- None

`__HAL_SMARTCARD_CLEAR_  
OREFLAG`

**Description:**

- Clear the SMARTCARD ORE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.

**Return value:**

- None

`__HAL_SMARTCARD_CLEAR_  
IDLEFLAG`

**Description:**

- Clear the SMARTCARD IDLE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.

**Return value:**

- None

[\\_\\_HAL\\_SMARTCARD\\_GET\\_FLAG](#) **Description:**

- Check whether the specified Smartcard flag is set or not.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the SMARTCARD Handle.
- [\\_\\_FLAG\\_\\_](#): specifies the flag to check. This parameter can be one of the following values:
  - [SMARTCARD\\_FLAG\\_RXACK](#) Receive enable acknowledge flag
  - [SMARTCARD\\_FLAG\\_TEACK](#) Transmit enable acknowledge flag
  - [SMARTCARD\\_FLAG\\_BUSY](#) Busy flag
  - [SMARTCARD\\_FLAG\\_EOBF](#) End of block flag
  - [SMARTCARD\\_FLAG\\_RTOF](#) Receiver timeout flag
  - [SMARTCARD\\_FLAG\\_TXE](#) Transmit data register empty flag
  - [SMARTCARD\\_FLAG\\_TC](#) Transmission complete flag
  - [SMARTCARD\\_FLAG\\_RXNE](#) Receive data register not empty flag
  - [SMARTCARD\\_FLAG\\_IDLE](#) Idle line detection flag
  - [SMARTCARD\\_FLAG\\_ORE](#) Overrun error flag
  - [SMARTCARD\\_FLAG\\_NE](#) Noise error flag
  - [SMARTCARD\\_FLAG\\_FE](#) Framing error flag
  - [SMARTCARD\\_FLAG\\_PE](#) Parity error flag

**Return value:**

- The new state of [\\_\\_FLAG\\_\\_](#) (TRUE or FALSE).

[\\_\\_HAL\\_SMARTCARD\\_ENABLE\\_IT](#)**Description:**

- Enable the specified SmartCard interrupt.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the SMARTCARD Handle.
- [\\_\\_INTERRUPT\\_\\_](#): specifies the SMARTCARD interrupt to enable. This parameter can be one of the following values:
  - [SMARTCARD\\_IT\\_EOB](#) End of block interrupt
  - [SMARTCARD\\_IT\\_RTO](#) Receive timeout interrupt
  - [SMARTCARD\\_IT\\_TXE](#) Transmit data register empty interrupt
  - [SMARTCARD\\_IT\\_TC](#) Transmission

- complete interrupt
- SMARTCARD\_IT\_RXNE Receive data register not empty interrupt
- SMARTCARD\_IT\_IDLE Idle line detection interrupt
- SMARTCARD\_IT\_PE Parity error interrupt
- SMARTCARD\_IT\_ERR Error interrupt(frame error, noise error, overrun error)

**Return value:**

- None

`__HAL_SMARTCARD_DISABLE_IT`

**Description:**

- Disable the specified SmartCard interrupt.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.
- `__INTERRUPT__`: specifies the SMARTCARD interrupt to disable. This parameter can be one of the following values:
  - SMARTCARD\_IT\_EOB End of block interrupt
  - SMARTCARD\_IT\_RTO Receive timeout interrupt
  - SMARTCARD\_IT\_TXE Transmit data register empty interrupt
  - SMARTCARD\_IT\_TC Transmission complete interrupt
  - SMARTCARD\_IT\_RXNE Receive data register not empty interrupt
  - SMARTCARD\_IT\_IDLE Idle line detection interrupt
  - SMARTCARD\_IT\_PE Parity error interrupt
  - SMARTCARD\_IT\_ERR Error interrupt(frame error, noise error, overrun error)

**Return value:**

- None

`__HAL_SMARTCARD_GET_IT`

**Description:**

- Check whether the specified SmartCard interrupt has occurred or not.

**Parameters:**

- `__HANDLE__`: specifies the SMARTCARD Handle.
- `__IT__`: specifies the SMARTCARD interrupt to check. This parameter can be one of the following values:
  - SMARTCARD\_IT\_EOB End of block interrupt

- SMARTCARD\_IT\_RTO Receive timeout interrupt
- SMARTCARD\_IT\_TXE Transmit data register empty interrupt
- SMARTCARD\_IT\_TC Transmission complete interrupt
- SMARTCARD\_IT\_RXNE Receive data register not empty interrupt
- SMARTCARD\_IT\_IDLE Idle line detection interrupt
- SMARTCARD\_IT\_ORE Overrun error interrupt
- SMARTCARD\_IT\_NE Noise error interrupt
- SMARTCARD\_IT\_FE Framing error interrupt
- SMARTCARD\_IT\_PE Parity error interrupt

**Return value:**

- The new state of \_\_IT\_\_ (TRUE or FALSE).

`__HAL_SMARTCARD_GET_IT_SOURCE`**Description:**

- Check whether the specified SmartCard interrupt source is enabled or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the SMARTCARD Handle.
- \_\_IT\_\_: specifies the SMARTCARD interrupt source to check. This parameter can be one of the following values:
  - SMARTCARD\_IT\_EOB End of block interrupt
  - SMARTCARD\_IT\_RTO Receive timeout interrupt
  - SMARTCARD\_IT\_TXE Transmit data register empty interrupt
  - SMARTCARD\_IT\_TC Transmission complete interrupt
  - SMARTCARD\_IT\_RXNE Receive data register not empty interrupt
  - SMARTCARD\_IT\_IDLE Idle line detection interrupt
  - SMARTCARD\_IT\_ERR Framing, overrun or noise error interrupt
  - SMARTCARD\_IT\_PE Parity error interrupt

**Return value:**

- The new state of \_\_IT\_\_ (TRUE or FALSE).

`__HAL_SMARTCARD_CLEAR_IT`**Description:**

- Clear the specified SMARTCARD ISR flag, in setting the proper ICR register flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the SMARTCARD Handle.
- \_\_IT\_CLEAR\_\_: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt. This parameter can be one of the following values:
  - SMARTCARD\_CLEAR\_PEF Parity error clear flag
  - SMARTCARD\_CLEAR\_FEF Framing error clear flag
  - SMARTCARD\_CLEAR\_NEF Noise detected clear flag
  - SMARTCARD\_CLEAR\_OREF OverRun error clear flag
  - SMARTCARD\_CLEAR\_IDLEF Idle line detection clear flag
  - SMARTCARD\_CLEAR\_TCF Transmission complete clear flag
  - SMARTCARD\_CLEAR\_RTOF Receiver timeout clear flag
  - SMARTCARD\_CLEAR\_EOBF End of block clear flag

**Return value:**

- None

[\\_\\_HAL\\_SMARTCARD\\_SEND\\_REQ](#)**Description:**

- Set a specific SMARTCARD request flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the SMARTCARD Handle.
- \_\_REQ\_\_: specifies the request flag to set. This parameter can be one of the following values:
  - SMARTCARD\_RXDATA\_FLUSH\_REQ ST Receive data flush Request
  - SMARTCARD\_TXDATA\_FLUSH\_REQ ST Transmit data flush Request

**Return value:**

- None

[\\_\\_HAL\\_SMARTCARD\\_ONE\\_BIT\\_SAMPLE\\_ENABLE](#)**Description:**

- Enable the SMARTCARD one bit sample method.

**Parameters:**

- \_\_HANDLE\_\_: specifies the SMARTCARD Handle.

**Return value:**

- None

|                                                     |                                                                                                                                                                                                                                                                                                                                                            |

## 46 HAL SMARTCARD Extension Driver

### 46.1 SMARTCARDEEx Firmware driver API description

#### 46.1.1 SMARTCARD peripheral extended features

The Extended SMARTCARD HAL driver can be used as follows:

1. After having configured the SMARTCARD basic features with `HAL_SMARTCARD_Init()`, then program SMARTCARD advanced features if required (TX/RX pins swap, TimeOut, auto-retry counter,...) in the `hsmartcard.AdvancedInit` structure.

#### 46.1.2 Peripheral Control functions

This subsection provides a set of functions allowing to initialize the SMARTCARD.

- `HAL_SMARTCARDEEx_BlockLength_Config()` API allows to configure the Block Length on the fly
- `HAL_SMARTCARDEEx_TimeOut_Config()` API allows to configure the receiver timeout value on the fly
- `HAL_SMARTCARDEEx_EnableReceiverTimeOut()` API enables the receiver timeout feature
- `HAL_SMARTCARDEEx_DisableReceiverTimeOut()` API disables the receiver timeout feature

This section contains the following APIs:

- `HAL_SMARTCARDEEx_BlockLength_Config()`
- `HAL_SMARTCARDEEx_TimeOut_Config()`
- `HAL_SMARTCARDEEx_EnableReceiverTimeOut()`
- `HAL_SMARTCARDEEx_DisableReceiverTimeOut()`

#### 46.1.3 Detailed description of functions

##### `HAL_SMARTCARDEEx_BlockLength_Config`

|                      |                                                                                                                                                                                                                                                                               |

## 47 HAL SMBUS Generic Driver

### 47.1 SMBUS Firmware driver registers structures

#### 47.1.1 SMBUS\_InitTypeDef

##### Data Fields

- *uint32\_t Timing*
- *uint32\_t AnalogFilter*
- *uint32\_t OwnAddress1*
- *uint32\_t AddressingMode*
- *uint32\_t DualAddressMode*
- *uint32\_t OwnAddress2*
- *uint32\_t OwnAddress2Masks*
- *uint32\_t GeneralCallMode*
- *uint32\_t NoStretchMode*
- *uint32\_t PacketErrorCheckMode*
- *uint32\_t PeripheralMode*
- *uint32\_t SMBusTimeout*

##### Field Documentation

- ***uint32\_t SMBUS\_InitTypeDef::Timing***  
Specifies the SMBUS\_TIMINGR\_register value. This parameter calculated by referring to SMBUS initialization section in Reference manual
- ***uint32\_t SMBUS\_InitTypeDef::AnalogFilter***  
Specifies if Analog Filter is enable or not. This parameter can be a value of [\*\*SMBUS\\_Analog\\_Filter\*\*](#)
- ***uint32\_t SMBUS\_InitTypeDef::OwnAddress1***  
Specifies the first device own address. This parameter can be a 7-bit or 10-bit address.
- ***uint32\_t SMBUS\_InitTypeDef::AddressingMode***  
Specifies if 7-bit or 10-bit addressing mode for master is selected. This parameter can be a value of [\*\*SMBUS\\_addressing\\_mode\*\*](#)
- ***uint32\_t SMBUS\_InitTypeDef::DualAddressMode***  
Specifies if dual addressing mode is selected. This parameter can be a value of [\*\*SMBUS\\_dual\\_addressing\\_mode\*\*](#)
- ***uint32\_t SMBUS\_InitTypeDef::OwnAddress2***  
Specifies the second device own address if dual addressing mode is selected This parameter can be a 7-bit address.
- ***uint32\_t SMBUS\_InitTypeDef::OwnAddress2Masks***  
Specifies the acknoledge mask address second device own address if dual addressing mode is selected This parameter can be a value of [\*\*SMBUS\\_own\\_address2\\_masks\*\*](#).
- ***uint32\_t SMBUS\_InitTypeDef::GeneralCallMode***  
Specifies if general call mode is selected. This parameter can be a value of [\*\*SMBUS\\_general\\_call\\_addressing\\_mode\*\*](#).
- ***uint32\_t SMBUS\_InitTypeDef::NoStretchMode***  
Specifies if nostretch mode is selected. This parameter can be a value of [\*\*SMBUS\\_nostretch\\_mode\*\*](#)

- ***uint32\_t SMBUS\_InitTypeDef::PacketErrorCheckMode***  
Specifies if Packet Error Check mode is selected. This parameter can be a value of **SMBUS\_packet\_error\_check\_mode**
- ***uint32\_t SMBUS\_InitTypeDef::PeripheralMode***  
Specifies which mode of Peripheral is selected. This parameter can be a value of **SMBUS\_peripheral\_mode**
- ***uint32\_t SMBUS\_InitTypeDef::SMBusTimeout***  
Specifies the content of the 32 Bits SMBUS\_TIMEOUT\_register value. (Enable bits and different timeout values) This parameter calculated by referring to SMBUS initialization section in Reference manual

#### 47.1.2 SMBUS\_HandleTypeDef

##### Data Fields

- ***I2C\_TypeDef \* Instance***
- ***SMBUS\_InitTypeDef Init***
- ***uint8\_t \* pBuffPtr***
- ***uint16\_t XferSize***
- ***\_\_IO uint16\_t XferCount***
- ***\_\_IO uint32\_t XferOptions***
- ***\_\_IO uint32\_t PreviousState***
- ***HAL\_LockTypeDef Lock***
- ***\_\_IO uint32\_t State***
- ***\_\_IO uint32\_t ErrorCode***

##### Field Documentation

- ***I2C\_TypeDef\* SMBUS\_HandleTypeDef::Instance***  
SMBUS registers base address
- ***SMBUS\_InitTypeDef SMBUS\_HandleTypeDef::Init***  
SMBUS communication parameters
- ***uint8\_t\* SMBUS\_HandleTypeDef::pBuffPtr***  
Pointer to SMBUS transfer buffer
- ***uint16\_t SMBUS\_HandleTypeDef::XferSize***  
SMBUS transfer size
- ***\_\_IO uint16\_t SMBUS\_HandleTypeDef::XferCount***  
SMBUS transfer counter
- ***\_\_IO uint32\_t SMBUS\_HandleTypeDef::XferOptions***  
SMBUS transfer options
- ***\_\_IO uint32\_t SMBUS\_HandleTypeDef::PreviousState***  
SMBUS communication Previous state
- ***HAL\_LockTypeDef SMBUS\_HandleTypeDef::Lock***  
SMBUS locking object
- ***\_\_IO uint32\_t SMBUS\_HandleTypeDef::State***  
SMBUS communication state
- ***\_\_IO uint32\_t SMBUS\_HandleTypeDef::ErrorCode***  
SMBUS Error code

## 47.2 SMBUS Firmware driver API description

### 47.2.1 How to use this driver

The SMBUS HAL driver can be used as follows:

1. Declare a SMBUS\_HandleTypeDef handle structure, for example:  
SMBUS\_HandleTypeDef hsmbus;
2. Initialize the SMBUS low level resources by implementing the HAL\_SMBUS\_MspInit() API:
  - a. Enable the SMBUSx interface clock
  - b. SMBUS pins configuration
    - Enable the clock for the SMBUS GPIOs
    - Configure SMBUS pins as alternate function open-drain
  - c. NVIC configuration if you need to use interrupt process
    - Configure the SMBUSx interrupt priority
    - Enable the NVIC SMBUS IRQ Channel
3. Configure the Communication Clock Timing, Bus Timeout, Own Address1, Master Addressing mode, Dual Addressing mode, Own Address2, Own Address2 Mask, General call, Nostretch mode, Peripheral mode and Packet Error Check mode in the hsmbus Init structure.
4. Initialize the SMBUS registers by calling the HAL\_SMBUS\_Init() API:
  - These API's configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL\_SMBUS\_MspInit(&hsmbus) API.
5. To check if target device is ready for communication, use the function HAL\_SMBUS\_IsDeviceReady()
6. For SMBUS IO operations, only one mode of operations is available within this driver

#### Interrupt mode IO operation

- Transmit in master/host SMBUS mode an amount of data in non-blocking mode using HAL\_SMBUS\_Master\_Transmit\_IT()
  - At transmission end of transfer HAL\_SMBUS\_MasterTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_SMBUS\_MasterTxCpltCallback()
- Receive in master/host SMBUS mode an amount of data in non-blocking mode using HAL\_SMBUS\_Master\_Receive\_IT()
  - At reception end of transfer HAL\_SMBUS\_MasterRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_SMBUS\_MasterRxCpltCallback()
- Abort a master/host SMBUS process communication with Interrupt using HAL\_SMBUS\_Master\_Abort\_IT()
  - The associated previous transfer callback is called at the end of abort process
  - mean HAL\_SMBUS\_MasterTxCpltCallback() in case of previous state was master transmit
  - mean HAL\_SMBUS\_MasterRxCpltCallback() in case of previous state was master receive
- Enable/disable the Address listen mode in slave/device or host/slave SMBUS mode using HAL\_SMBUS\_EnableListen\_IT() HAL\_SMBUS\_DisableListen\_IT()
  - When address slave/device SMBUS match, HAL\_SMBUS\_AddrCallback() is executed and user can add his own code to check the Address Match Code and the transmission direction request by master/host (Write/Read).

- At Listen mode end HAL\_SMBUS\_ListenCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_SMBUS\_ListenCpltCallback()
- Transmit in slave/device SMBUS mode an amount of data in non-blocking mode using HAL\_SMBUS\_Slave\_Transmit\_IT()
  - At transmission end of transfer HAL\_SMBUS\_SlaveTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_SMBUS\_SlaveTxCpltCallback()
- Receive in slave/device SMBUS mode an amount of data in non-blocking mode using HAL\_SMBUS\_Slave\_Receive\_IT()
  - At reception end of transfer HAL\_SMBUS\_SlaveRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_SMBUS\_SlaveRxCpltCallback()
- Enable/Disable the SMBUS alert mode using HAL\_SMBUS\_EnableAlert\_IT()
  - When SMBUS Alert is generated HAL\_SMBUS\_ErrorCallback() is executed and user can add his own code by customization of function pointer HAL\_SMBUS\_ErrorCallback() to check the Alert Error Code using function HAL\_SMBUS\_GetError()
- Get HAL state machine or error values using HAL\_SMBUS\_GetState() or HAL\_SMBUS\_GetError()
- In case of transfer Error, HAL\_SMBUS\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_SMBUS\_ErrorCallback() to check the Error Code using function HAL\_SMBUS\_GetError()

### SMBUS HAL driver macros list

Below the list of most used macros in SMBUS HAL driver.

- \_\_HAL\_SMBUS\_ENABLE: Enable the SMBUS peripheral
- \_\_HAL\_SMBUS\_DISABLE: Disable the SMBUS peripheral
- \_\_HAL\_SMBUS\_GET\_FLAG: Check whether the specified SMBUS flag is set or not
- \_\_HAL\_SMBUS\_CLEAR\_FLAG: Clear the specified SMBUS pending flag
- \_\_HAL\_SMBUS\_ENABLE\_IT: Enable the specified SMBUS interrupt
- \_\_HAL\_SMBUS\_DISABLE\_IT: Disable the specified SMBUS interrupt

You can refer to the SMBUS HAL driver header file for more useful macros

#### 47.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the SMBUSx peripheral:

- User must Implement HAL\_SMBUS\_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, IT and NVIC ).
- Call the function HAL\_SMBUS\_Init() to configure the selected device with the selected configuration:
  - Clock Timing
  - Bus Timeout
  - Analog Filter mode
  - Own Address 1

- Addressing mode (Master, Slave)
- Dual Addressing mode
- Own Address 2
- Own Address 2 Mask
- General call mode
- Nostretch mode
- Packet Error Check mode
- Peripheral mode
- Call the function HAL\_SMBUS\_DelInit() to restore the default configuration of the selected SMBUSx peripheral.
- Enable/Disable Analog/Digital filters with HAL\_SMBUS\_ConfigAnalogFilter() and HAL\_SMBUS\_ConfigDigitalFilter().

This section contains the following APIs:

- [\*\*\*HAL\\_SMBUS\\_Init\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_DelInit\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_MspInit\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_MspDelInit\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_ConfigAnalogFilter\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_ConfigDigitalFilter\(\)\*\*\*](#)

### 47.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the SMBUS data transfers.

1. Blocking mode function to check if device is ready for usage is :
  - HAL\_SMBUS\_IsDeviceReady()
2. There is only one mode of transfer:
  - Non-Blocking mode : The communication is performed using Interrupts. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated SMBUS IRQ when using Interrupt mode.
3. Non-Blocking mode functions with Interrupt are :
  - HAL\_SMBUS\_Master\_Transmit\_IT()
  - HAL\_SMBUS\_Master\_Receive\_IT()
  - HAL\_SMBUS\_Slave\_Transmit\_IT()
  - HAL\_SMBUS\_Slave\_Receive\_IT()
  - HAL\_SMBUS\_EnableListen\_IT() or alias HAL\_SMBUS\_EnableListen\_IT()
  - HAL\_SMBUS\_DisableListen\_IT()
  - HAL\_SMBUS\_EnableAlert\_IT()
  - HAL\_SMBUS\_DisableAlert\_IT()
4. A set of Transfer Complete Callbacks are provided in non-Blocking mode:
  - HAL\_SMBUS\_MasterTxCpltCallback()
  - HAL\_SMBUS\_MasterRxCpltCallback()
  - HAL\_SMBUS\_SlaveTxCpltCallback()
  - HAL\_SMBUS\_SlaveRxCpltCallback()
  - HAL\_SMBUS\_AddrCallback()
  - HAL\_SMBUS\_ListenCpltCallback()
  - HAL\_SMBUS\_ErrorCallback()

This section contains the following APIs:

- [\*\*\*HAL\\_SMBUS\\_Master\\_Transmit\\_IT\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_Master\\_Receive\\_IT\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_Master\\_Abort\\_IT\(\)\*\*\*](#)
- [\*\*\*HAL\\_SMBUS\\_Slave\\_Transmit\\_IT\(\)\*\*\*](#)

- [\*HAL\\_SMBUS\\_Slave\\_Receive\\_IT\(\)\*](#)
- [\*HAL\\_SMBUS\\_EnableListen\\_IT\(\)\*](#)
- [\*HAL\\_SMBUS\\_DisableListen\\_IT\(\)\*](#)
- [\*HAL\\_SMBUS\\_EnableAlert\\_IT\(\)\*](#)
- [\*HAL\\_SMBUS\\_DisableAlert\\_IT\(\)\*](#)
- [\*HAL\\_SMBUS\\_IsDeviceReady\(\)\*](#)

#### 47.2.4 Peripheral State and Errors functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- [\*HAL\\_SMBUS\\_GetState\(\)\*](#)
- [\*HAL\\_SMBUS\\_GetError\(\)\*](#)

#### 47.2.5 Detailed description of functions

##### **HAL\_SMBUS\_Init**

|                      |                                                                                                                                                                                    |

**SMBUS Error Code definition**

|                            |                   |
|----------------------------|-------------------|
| HAL_SMBUS_ERROR_NONE       | No error          |
| HAL_SMBUS_ERROR_BERR       | BERR error        |
| HAL_SMBUS_ERROR_ARLO       | ARLO error        |
| HAL_SMBUS_ERROR_ACKF       | ACKF error        |
| HAL_SMBUS_ERROR_OVR        | OVR error         |
| HAL_SMBUS_ERROR_HALTIMEOUT | Timeout error     |
| HAL_SMBUS_ERROR_BUSTIMEOUT | Bus Timeout error |
| HAL_SMBUS_ERROR_ALERT      | Alert error       |
| HAL_SMBUS_ERROR_PECERR     | PEC error         |

**SMBUS Exported Macros**

`_HAL_SMBUS_RESET_HANDLE_STATE` **Description:**

- Reset SMBUS handle state.

**Parameters:**

- `_HANDLE_`: specifies the SMBUS Handle.

**Return value:**

- None

`_HAL_SMBUS_ENABLE_IT` **Description:**

- Enable the specified SMBUS interrupts.

**Parameters:**

- `_HANDLE_`: specifies the SMBUS Handle.
- `_INTERRUPT_`: specifies the interrupt source to enable. This parameter can be one of the following values:
  - `SMBUS_IT_ERRI` Errors interrupt enable
  - `SMBUS_IT_TCI` Transfer complete interrupt enable
  - `SMBUS_IT_STOPI` STOP detection interrupt enable
  - `SMBUS_IT_NACKI` NACK received interrupt enable
  - `SMBUS_IT_ADDRI` Address match interrupt enable
  - `SMBUS_IT_RXI` RX interrupt enable
  - `SMBUS_IT_TXI` TX interrupt enable

**Return value:**

- None

[\\_\\_HAL\\_SMBUS\\_DISABLE\\_IT](#)**Description:**

- Disable the specified SMBUS interrupts.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the SMBUS Handle.
- [\\_\\_INTERRUPT\\_\\_](#): specifies the interrupt source to disable. This parameter can be one of the following values:
  - [SMBUS\\_IT\\_ERRI](#) Errors interrupt enable
  - [SMBUS\\_IT\\_TCI](#) Transfer complete interrupt enable
  - [SMBUS\\_IT\\_STOPI](#) STOP detection interrupt enable
  - [SMBUS\\_IT\\_NACKI](#) NACK received interrupt enable
  - [SMBUS\\_IT\\_ADDRI](#) Address match interrupt enable
  - [SMBUS\\_IT\\_RXI](#) RX interrupt enable
  - [SMBUS\\_IT\\_TXI](#) TX interrupt enable

**Return value:**

- None

[\\_\\_HAL\\_SMBUS\\_GET\\_IT\\_SOURCE](#)**Description:**

- Check whether the specified SMBUS interrupt source is enabled or not.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the SMBUS Handle.
- [\\_\\_INTERRUPT\\_\\_](#): specifies the SMBUS interrupt source to check. This parameter can be one of the following values:
  - [SMBUS\\_IT\\_ERRI](#) Errors interrupt enable
  - [SMBUS\\_IT\\_TCI](#) Transfer complete interrupt enable
  - [SMBUS\\_IT\\_STOPI](#) STOP detection interrupt enable
  - [SMBUS\\_IT\\_NACKI](#) NACK received interrupt enable
  - [SMBUS\\_IT\\_ADDRI](#) Address match interrupt enable
  - [SMBUS\\_IT\\_RXI](#) RX interrupt enable
  - [SMBUS\\_IT\\_TXI](#) TX interrupt

enable

**Return value:**

- The: new state of \_\_IT\_\_ (TRUE or FALSE).

SMBUS\_FLAG\_MASK

**Description:**

- Check whether the specified SMBUS flag is set or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the SMBUS Handle.
- \_\_FLAG\_\_: specifies the flag to check. This parameter can be one of the following values:
  - SMBUS\_FLAG\_TXE Transmit data register empty
  - SMBUS\_FLAG\_TXIS Transmit interrupt status
  - SMBUS\_FLAG\_RXNE Receive data register not empty
  - SMBUS\_FLAG\_ADDR Address matched (slave mode)
  - SMBUS\_FLAG\_AF NACK received flag
  - SMBUS\_FLAG\_STOPF STOP detection flag
  - SMBUS\_FLAG\_TC Transfer complete (master mode)
  - SMBUS\_FLAG\_TCR Transfer complete reload
  - SMBUS\_FLAG\_BERR Bus error
  - SMBUS\_FLAG\_ARLO Arbitration lost
  - SMBUS\_FLAG\_OVR Overrun/Underrun
  - SMBUS\_FLAG\_PECERR PEC error in reception
  - SMBUS\_FLAG\_TIMEOUT Timeout or Tlow detection flag
  - SMBUS\_FLAG\_ALERT SMBus alert
  - SMBUS\_FLAG\_BUSY Bus busy
  - SMBUS\_FLAG\_DIR Transfer direction (slave mode)

**Return value:**

- The: new state of \_\_FLAG\_\_ (TRUE or FALSE).

`__HAL_SMBUS_GET_FLAG`  
`__HAL_SMBUS_CLEAR_FLAG`

**Description:**

- Clear the SMBUS pending flags which are cleared by writing 1 in a specific bit.

**Parameters:**

- `__HANDLE__`: specifies the SMBUS Handle.
- `__FLAG__`: specifies the flag to clear. This parameter can be any combination of the following values:
  - `SMBUS_FLAG_ADDR` Address matched (slave mode)
  - `SMBUS_FLAG_AF_NACK` received flag
  - `SMBUS_FLAG_STOPF` STOP detection flag
  - `SMBUS_FLAG_BERR` Bus error
  - `SMBUS_FLAG_ARLO` Arbitration lost
  - `SMBUS_FLAG_OVR` Overrun/Underrun
  - `SMBUS_FLAG_PECERR` PEC error in reception
  - `SMBUS_FLAG_TIMEOUT` Timeout or Tlow detection flag
  - `SMBUS_FLAG_ALERT` SMBus alert

**Return value:**

- None

`__HAL_SMBUS_ENABLE`

**Description:**

- Enable the specified SMBUS peripheral.

**Parameters:**

- `__HANDLE__`: specifies the SMBUS Handle.

**Return value:**

- None

`__HAL_SMBUS_DISABLE`

**Description:**

- Disable the specified SMBUS peripheral.

**Parameters:**

- `__HANDLE__`: specifies the SMBUS Handle.

**Return value:**

- None

`__HAL_SMBUS_GENERATE_NACK`

**Description:**

- Generate a Non-Acknowledge SMBUS peripheral in Slave mode.

**Parameters:**

- `__HANDLE__`: specifies the SMBUS Handle.

**Return value:**

- None

## 48 HAL SPI Generic Driver

### 48.1 SPI Firmware driver registers structures

#### 48.1.1 SPI\_InitTypeDef

##### Data Fields

- *uint32\_t Mode*
- *uint32\_t Direction*
- *uint32\_t DataSize*
- *uint32\_t CLKPolarity*
- *uint32\_t CLKPhase*
- *uint32\_t NSS*
- *uint32\_t BaudRatePrescaler*
- *uint32\_t FirstBit*
- *uint32\_t TIMode*
- *uint32\_t CRCCalculation*
- *uint32\_t CRCPolynomial*
- *uint32\_t CRCLength*
- *uint32\_t NSSPMode*

##### Field Documentation

- ***uint32\_t SPI\_InitTypeDef::Mode***  
Specifies the SPI operating mode. This parameter can be a value of [\*\*SPI\\_Mode\*\*](#)
- ***uint32\_t SPI\_InitTypeDef::Direction***  
Specifies the SPI bidirectional mode state. This parameter can be a value of [\*\*SPI\\_Direction\*\*](#)
- ***uint32\_t SPI\_InitTypeDef::DataSize***  
Specifies the SPI data size. This parameter can be a value of [\*\*SPI\\_Data\\_Size\*\*](#)
- ***uint32\_t SPI\_InitTypeDef::CLKPolarity***  
Specifies the serial clock steady state. This parameter can be a value of [\*\*SPI\\_Clock\\_Polarity\*\*](#)
- ***uint32\_t SPI\_InitTypeDef::CLKPhase***  
Specifies the clock active edge for the bit capture. This parameter can be a value of [\*\*SPI\\_Clock\\_Phase\*\*](#)
- ***uint32\_t SPI\_InitTypeDef::NSS***  
Specifies whether the NSS signal is managed by hardware (NSS pin) or by software using the SSI bit. This parameter can be a value of [\*\*SPI\\_Slave\\_Select\\_management\*\*](#)
- ***uint32\_t SPI\_InitTypeDef::BaudRatePrescaler***  
Specifies the Baud Rate prescaler value which will be used to configure the transmit and receive SCK clock. This parameter can be a value of [\*\*SPI\\_BaudRate\\_Prescaler\*\*](#)  
**Note:** The communication clock is derived from the master clock. The slave clock does not need to be set.
- ***uint32\_t SPI\_InitTypeDef::FirstBit***  
Specifies whether data transfers start from MSB or LSB bit. This parameter can be a value of [\*\*SPI\\_MSB\\_LSB\\_transmission\*\*](#)
- ***uint32\_t SPI\_InitTypeDef::TIMode***  
Specifies if the TI mode is enabled or not. This parameter can be a value of [\*\*SPI\\_TI\\_mode\*\*](#)

- ***uint32\_t SPI\_InitTypeDef::CRCCalculation***  
Specifies if the CRC calculation is enabled or not. This parameter can be a value of **SPI\_CRC\_Calculation**
- ***uint32\_t SPI\_InitTypeDef::CRCPolynomial***  
Specifies the polynomial used for the CRC calculation. This parameter must be an odd number between Min\_Data = 1 and Max\_Data = 65535
- ***uint32\_t SPI\_InitTypeDef::CRCLength***  
Specifies the CRC Length used for the CRC calculation. CRC Length is only used with Data8 and Data16, not other data size This parameter can be a value of **SPI\_CRC\_length**
- ***uint32\_t SPI\_InitTypeDef::NSSPMode***  
Specifies whether the NSSP signal is enabled or not . This parameter can be a value of **SPI\_NSSP\_Mode** This mode is activated by the NSSP bit in the SPIx\_CR2 register and it takes effect only if the SPI interface is configured as Motorola SPI master (FRF=0) with capture on the first edge (SPIx\_CR1 CPHA = 0, CPOL setting is ignored)..

SPI Error code

## 48.2 SPI Firmware driver API description

### 48.2.1 How to use this driver

The SPI HAL driver can be used as follows:

1. Declare a SPI\_HandleTypeDef handle structure, for example: SPI\_HandleTypeDef hspi;
2. Initialize the SPI low level resources by implementing the HAL\_SPI\_MspInit() API:
  - a. Enable the SPIx interface clock
  - b. SPI pins configuration
    - Enable the clock for the SPI GPIOs
    - Configure these SPI pins as alternate function push-pull
  - c. NVIC configuration if you need to use interrupt process
    - Configure the SPIx interrupt priority
    - Enable the NVIC SPI IRQ handle
  - d. DMA Configuration if you need to use DMA process
    - Declare a DMA\_HandleTypeDef handle structure for the transmit or receive Stream/Channel
    - Enable the DMAx clock
    - Configure the DMA handle parameters
    - Configure the DMA Tx or Rx Stream/Channel
    - Associate the initialized hdma\_tx handle to the hspi DMA Tx or Rx handle
    - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx or Rx Stream/Channel
3. Program the Mode, BidirectionalMode , Data size, Baudrate Prescaler, NSS management, Clock polarity and phase, FirstBit and CRC configuration in the hspi Init structure.
4. Initialize the SPI registers by calling the HAL\_SPI\_Init() API:
  - This API configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL\_SPI\_MspInit() API.

Circular mode restriction:

1. The DMA circular mode cannot be used when the SPI is configured in these modes:
  - a. Master 2Lines RxOnly
  - b. Master 1Line Rx
2. The CRC feature is not managed when the DMA circular mode is enabled

3. When the SPI DMA Pause/Stop features are used, we must use the following APIs the HAL\_SPI\_DMAPause() / HAL\_SPI\_DMAStop() only under the SPI callbacks

Master Receive mode restriction:

1. In Master unidirectional receive-only mode (MSTR =1, BIDIMODE=0, RXONLY=0) or bidirectional receive mode (MSTR=1, BIDIMODE=1, BIDIOE=0), to ensure that the SPI does not initiate a new transfer the following procedure has to be respected:
  - a. HAL\_SPI\_DeInit()
  - b. HAL\_SPI\_Init()

The HAL drivers do not allow reaching all supported SPI frequencies in the different SPI modes. Refer to the source code (stm32xxxx\_hal\_spi.c header) to get a summary of the maximum SPI frequency that can be reached with a data size of 8 or 16 bits, depending on the APBx peripheral clock frequency (fPCLK) used by the SPI instance.

## 48.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and de-initialize the SPIx peripheral:

- User must implement HAL\_SPI\_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC ).
- Call the function HAL\_SPI\_Init() to configure the selected device with the selected configuration:
  - Mode
  - Direction
  - Data Size
  - Clock Polarity and Phase
  - NSS Management
  - BaudRate Prescaler
  - FirstBit
  - TIMode
  - CRC Calculation
  - CRC Polynomial if CRC enabled
  - CRC Length, used only with Data8 and Data16
  - FIFO reception threshold
- Call the function HAL\_SPI\_DeInit() to restore the default configuration of the selected SPIx peripheral.

This section contains the following APIs:

- [\*\*HAL\\_SPI\\_Init\(\)\*\*](#)
- [\*\*HAL\\_SPI\\_DeInit\(\)\*\*](#)
- [\*\*HAL\\_SPI\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_SPI\\_MspDeInit\(\)\*\*](#)

## 48.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the SPI data transfers.

The SPI supports master and slave mode :

1. There are two modes of transfer:
  - Blocking mode: The communication is performed in polling mode. The HAL status of all data processing is returned by the same function after finishing transfer.
  - No-Blocking mode: The communication is performed using Interrupts or DMA, These APIs return the HAL status. The end of the data processing will be

indicated through the dedicated SPI IRQ when using Interrupt mode or the DMA IRQ when using DMA mode. The HAL\_SPI\_TxCpltCallback(), HAL\_SPI\_RxCpltCallback() and HAL\_SPI\_TxRxCpltCallback() user callbacks will be executed respectively at the end of the transmit or Receive process. The HAL\_SPI\_ErrorCallback() user callback will be executed when a communication error is detected.

2. APIs provided for these 2 transfer modes (Blocking mode or Non blocking mode using either Interrupt or DMA) exist for 1Line (simplex) and 2Lines (full duplex) modes.

This section contains the following APIs:

- [`HAL\_SPI\_Transmit\(\)`](#)
- [`HAL\_SPI\_Receive\(\)`](#)
- [`HAL\_SPI\_TransmitReceive\(\)`](#)
- [`HAL\_SPI\_Transmit\_IT\(\)`](#)
- [`HAL\_SPI\_Receive\_IT\(\)`](#)
- [`HAL\_SPI\_TransmitReceive\_IT\(\)`](#)
- [`HAL\_SPI\_Transmit\_DMA\(\)`](#)
- [`HAL\_SPI\_Receive\_DMA\(\)`](#)
- [`HAL\_SPI\_TransmitReceive\_DMA\(\)`](#)
- [`HAL\_SPI\_Abort\(\)`](#)
- [`HAL\_SPI\_Abort\_IT\(\)`](#)
- [`HAL\_SPI\_DMAPause\(\)`](#)
- [`HAL\_SPI\_DMAResume\(\)`](#)
- [`HAL\_SPI\_DMAStop\(\)`](#)
- [`HAL\_SPI\_IRQHandler\(\)`](#)
- [`HAL\_SPI\_TxCpltCallback\(\)`](#)
- [`HAL\_SPI\_RxCpltCallback\(\)`](#)
- [`HAL\_SPI\_TxRxCpltCallback\(\)`](#)
- [`HAL\_SPI\_TxHalfCpltCallback\(\)`](#)
- [`HAL\_SPI\_RxHalfCpltCallback\(\)`](#)
- [`HAL\_SPI\_TxRxHalfCpltCallback\(\)`](#)
- [`HAL\_SPI\_ErrorCallback\(\)`](#)
- [`HAL\_SPI\_AbortCpltCallback\(\)`](#)

#### 48.2.4 Peripheral State and Errors functions

This subsection provides a set of functions allowing to control the SPI.

- `HAL_SPI_GetState()` API can be helpful to check in run-time the state of the SPI peripheral
- `HAL_SPI_GetError()` check in run-time Errors occurring during communication

This section contains the following APIs:

- [`HAL\_SPI\_GetState\(\)`](#)
- [`HAL\_SPI\_GetError\(\)`](#)

#### 48.2.5 Detailed description of functions

##### **HAL\_SPI\_Init**

| Parameters           | • <b>hspi:</b> pointer to a SPI_HandleTypeDef structure that contains the configuration information for the specified SPI module. |
| Return values        | • <b>HAL:</b> status                                                                                                              |

### **HAL\_SPI\_Abort**

|                      |                                                                                                                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_SPI_Abort (SPI_HandleTypeDef * hspi)</b>                                                                                                                                                                      |
| Function description | Abort ongoing transfer (blocking mode).                                                                                                                                                                                                |
| Parameters           | • <b>hspi:</b> SPI handle.                                                                                                                                                                                                             |
| Return values        | • <b>HAL:</b> status                                                                                                                                                                                                                   |
| Notes                | • This procedure could be used for aborting any ongoing transfer (Tx and Rx), started in Interrupt or DMA mode. This procedure performs following operations : Disable SPI Interrupts (depending of transfer direction)Disable the DMA |

- transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL\_DMA\_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

| Function description | Rx Transfer completed callback.                                                                                         |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hspi:</b> pointer to a SPI_HandleTypeDef structure that contains</li> </ul> |

the configuration information for SPI module.

Return values

- **None**

### **HAL\_SPI\_TxRxCpltCallback**

Function name **void HAL\_SPI\_TxRxCpltCallback (SPI\_HandleTypeDef \* hspi)**

Function description Tx and Rx Transfer completed callback.

Parameters

- **hspi:** pointer to a SPI\_HandleTypeDef structure that contains the configuration information for SPI module.

Return values

- **None**

### **HAL\_SPI\_TxHalfCpltCallback**

Function name **void HAL\_SPI\_TxHalfCpltCallback (SPI\_HandleTypeDef \* hspi)**

Function description Tx Half Transfer completed callback.

Parameters

- **hspi:** pointer to a SPI\_HandleTypeDef structure that contains the configuration information for SPI module.

Return values

- **None**

### **HAL\_SPI\_RxHalfCpltCallback**

Function name **void HAL\_SPI\_RxHalfCpltCallback (SPI\_HandleTypeDef \* hspi)**

Function description Rx Half Transfer completed callback.

Parameters

- **hspi:** pointer to a SPI\_HandleTypeDef structure that contains the configuration information for SPI module.

Return values

- **None**

### **HAL\_SPI\_TxRxHalfCpltCallback**

Function name **void HAL\_SPI\_TxRxHalfCpltCallback (SPI\_HandleTypeDef \* hspi)**

Function description Tx and Rx Half Transfer callback.

Parameters

- **hspi:** pointer to a SPI\_HandleTypeDef structure that contains the configuration information for SPI module.

Return values

- **None**

### **HAL\_SPI\_ErrorCallback**

Function name **void HAL\_SPI\_ErrorCallback (SPI\_HandleTypeDef \* hspi)**

Function description SPI error callback.

Parameters

- **hspi:** pointer to a SPI\_HandleTypeDef structure that contains the configuration information for SPI module.

Return values

- **None**

**HAL\_SPI\_AbortCpltCallback**

|                      |                                                                            |

HAL\_SPI\_ERROR\_FLAG Error on RXNE/TXE/BSY/FTLVL/FRLVL Flag

HAL\_SPI\_ERROR\_ABORT Error during SPI Abort procedure

**SPI Exported Macros**`__HAL_SPI_RESET_HANDLE_STATE`**Description:**

- Reset SPI handle state.

**Parameters:**

- `__HANDLE__`: specifies the SPI Handle.  
This parameter can be SPI where x: 1, 2, or 3 to select the SPI peripheral.

**Return value:**

- None

`__HAL_SPI_ENABLE_IT`**Description:**

- Enable the specified SPI interrupts.

**Parameters:**

- `__HANDLE__`: specifies the SPI Handle.  
This parameter can be SPI where x: 1, 2, or 3 to select the SPI peripheral.
- `__INTERRUPT__`: specifies the interrupt source to enable. This parameter can be one of the following values:
  - `SPI_IT_TXE`: Tx buffer empty interrupt enable
  - `SPI_IT_RXNE`: RX buffer not empty interrupt enable
  - `SPI_IT_ERR`: Error interrupt enable

**Return value:**

- None

`__HAL_SPI_DISABLE_IT`**Description:**

- Disable the specified SPI interrupts.

**Parameters:**

- `__HANDLE__`: specifies the SPI handle.  
This parameter can be SPIx where x: 1, 2, or 3 to select the SPI peripheral.
- `__INTERRUPT__`: specifies the interrupt source to disable. This parameter can be one of the following values:
  - `SPI_IT_TXE`: Tx buffer empty interrupt enable
  - `SPI_IT_RXNE`: RX buffer not empty interrupt enable
  - `SPI_IT_ERR`: Error interrupt enable

**Return value:**

- None

`__HAL_SPI_GET_IT_SOURCE`**Description:**

- Check whether the specified SPI interrupt

source is enabled or not.

**Parameters:**

- HANDLE: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, or 3 to select the SPI peripheral.
- INTERRUPT: specifies the SPI interrupt source to check. This parameter can be one of the following values:
  - SPI\_IT\_TXE: Tx buffer empty interrupt enable
  - SPI\_IT\_RXNE: RX buffer not empty interrupt enable
  - SPI\_IT\_ERR: Error interrupt enable

**Return value:**

- The: new state of IT (TRUE or FALSE).

\_HAL\_SPI\_GET\_FLAG

- Description:**
- Check whether the specified SPI flag is set or not.

**Parameters:**

- HANDLE: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, or 3 to select the SPI peripheral.
- FLAG: specifies the flag to check. This parameter can be one of the following values:
  - SPI\_FLAG\_RXNE: Receive buffer not empty flag
  - SPI\_FLAG\_TXE: Transmit buffer empty flag
  - SPI\_FLAG\_CRCERR: CRC error flag
  - SPI\_FLAG\_MODF: Mode fault flag
  - SPI\_FLAG\_OVR: Overrun flag
  - SPI\_FLAG\_BSY: Busy flag
  - SPI\_FLAG\_FRE: Frame format error flag
  - SPI\_FLAG\_FTLVL: SPI fifo transmission level
  - SPI\_FLAG\_FRLVL: SPI fifo reception level

**Return value:**

- The: new state of FLAG (TRUE or FALSE).

\_HAL\_SPI\_CLEAR\_CRCERRFLAG

**Description:**

- Clear the SPI CRCERR pending flag.

**Parameters:**

- HANDLE: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, or 3 to select the SPI peripheral.

3 to select the SPI peripheral.

**Return value:**

- None

`__HAL_SPI_CLEAR_MODFLAG`

**Description:**

- Clear the SPI MODF pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SPI Handle.  
This parameter can be SPI where x: 1, 2, or  
3 to select the SPI peripheral.

**Return value:**

- None

`__HAL_SPI_CLEAR_OVRFLAG`

**Description:**

- Clear the SPI OVR pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SPI Handle.  
This parameter can be SPI where x: 1, 2, or  
3 to select the SPI peripheral.

**Return value:**

- None

`__HAL_SPI_CLEAR_FREFLAG`

**Description:**

- Clear the SPI FRE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the SPI Handle.  
This parameter can be SPI where x: 1, 2, or  
3 to select the SPI peripheral.

**Return value:**

- None

`__HAL_SPI_ENABLE`

**Description:**

- Enable the SPI peripheral.

**Parameters:**

- `__HANDLE__`: specifies the SPI Handle.  
This parameter can be SPI where x: 1, 2, or  
3 to select the SPI peripheral.

**Return value:**

- None

`__HAL_SPI_DISABLE`

**Description:**

- Disable the SPI peripheral.

**Parameters:**

- `__HANDLE__`: specifies the SPI Handle.

This parameter can be SPI where x: 1, 2, or 3 to select the SPI peripheral.

**Return value:**

- None

## 49 HAL SPI Extension Driver

### 49.1 SPIEx Firmware driver API description

#### 49.1.1 IO operation functions

This subsection provides a set of extended functions to manage the SPI data transfers.

1. Rx data flush function:
  - HAL\_SPIEx\_FlushRxFifo()

This section contains the following APIs:

- [\*HAL\\_SPIEx\\_FlushRxFifo\(\)\*](#)

#### 49.1.2 Detailed description of functions

##### **HAL\_SPIEx\_FlushRxFifo**

Function name            **HAL\_StatusTypeDef HAL\_SPIEx\_FlushRxFifo  
(SPI\_HandleTypeDef \* hspi)**

Function description    Flush the RX fifo.

Parameters              • **hspi**: pointer to a SPI\_HandleTypeDef structure that contains the configuration information for the specified SPI module.

Return values            • **HAL**: status

## 50 HAL SRAM Generic Driver

### 50.1 SRAM Firmware driver registers structures

#### 50.1.1 SRAM\_HandleTypeDef

##### Data Fields

- *FMC\_NORSRAM\_TypeDef \* Instance*
- *FMC\_NORSRAM\_EXTENDED\_TypeDef \* Extended*

- ***\_\_IO HAL\_SRAM\_StateTypeDef SRAM\_HandleTypeDef::State***  
SRAM device access state
- ***DMA\_HandleTypeDef\* SRAM\_HandleTypeDef::hdma***  
Pointer DMA handler

### 50.2 SRAM Firmware driver API description

#### 50.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control SRAM memories. It uses the FMC layer functions to interface with SRAM devices. The following sequence should be followed to configure the FMC to interface with SRAM/PSRAM memories:

1. Declare a SRAM\_HandleTypeDef handle structure, for example:  
SRAM\_HandleTypeDef hsram; and:
  - Fill the SRAM\_HandleTypeDef handle "Init" field with the allowed values of the structure member.
  - Fill the SRAM\_HandleTypeDef handle "Instance" field with a predefined base register instance for NOR or SRAM device
  - Fill the SRAM\_HandleTypeDef handle "Extended" field with a predefined base register instance for NOR or SRAM extended mode
2. Declare two FMC\_NORSRAM\_TimingTypeDef structures, for both normal and extended mode timings; for example: FMC\_NORSRAM\_TimingTypeDef Timing and FMC\_NORSRAM\_TimingTypeDef ExTiming; and fill its fields with the allowed values of the structure member.
3. Initialize the SRAM Controller by calling the function HAL\_SRAM\_Init(). This function performs the following sequence:
  - a. MSP hardware layer configuration using the function HAL\_SRAM\_MspInit()

- b. Control register configuration using the FMC NORSRAM interface function `FMC_NORSRAM_Init()`
  - c. Timing register configuration using the FMC NORSRAM interface function `FMC_NORSRAM_Timing_Init()`
  - d. Extended mode Timing register configuration using the FMC NORSRAM interface function `FMC_NORSRAM_Extended_Timing_Init()`
  - e. Enable the SRAM device using the macro `__FMC_NORSRAM_ENABLE()`
4. At this stage you can perform read/write accesses from/to the memory connected to the NOR/SRAM Bank. You can perform either polling or DMA transfer using the following APIs:
    - `HAL_SRAM_Read()`/`HAL_SRAM_Write()` for polling read/write access
    - `HAL_SRAM_Read_DMA()`/`HAL_SRAM_Write_DMA()` for DMA read/write transfer
  5. You can also control the SRAM device by calling the control APIs `HAL_SRAM_WriteOperation_Enable()`/`HAL_SRAM_WriteOperation_Disable()` to respectively enable/disable the SRAM write operation
  6. You can continuously monitor the SRAM device HAL state by calling the function `HAL_SRAM_GetState()`

### 50.2.2 SRAM Initialization and de\_initialization functions

This section provides functions allowing to initialize/de-initialize the SRAM memory

This section contains the following APIs:

- `HAL_SRAM_Init()`
- `HAL_SRAM_DeInit()`
- `HAL_SRAM_MspInit()`
- `HAL_SRAM_MspDeInit()`
- `HAL_SRAM_DMA_XferCpltCallback()`
- `HAL_SRAM_DMA_XferErrorCallback()`

### 50.2.3 SRAM Input and Output functions

This section provides functions allowing to use and control the SRAM memory

This section contains the following APIs:

- `HAL_SRAM_Read_8b()`
- `HAL_SRAM_Write_8b()`
- `HAL_SRAM_Read_16b()`
- `HAL_SRAM_Write_16b()`
- `HAL_SRAM_Read_32b()`
- `HAL_SRAM_Write_32b()`
- `HAL_SRAM_Read_DMA()`
- `HAL_SRAM_Write_DMA()`

### 50.2.4 SRAM Control functions

This subsection provides a set of functions allowing to control dynamically the SRAM interface.

This section contains the following APIs:

- `HAL_SRAM_WriteOperation_Enable()`
- `HAL_SRAM_WriteOperation_Disable()`

## 50.2.5 SRAM State functions

This subsection permits to get in run-time the status of the SRAM controller and the data flow.

This section contains the following APIs:

- [\*\*HAL\\_SRAM\\_GetState\(\)\*\*](#)

## 50.2.6 Detailed description of functions

### **HAL\_SRAM\_Init**

|                      |                                                                                                                                                                                                                                                                                                                         |

## 50.3 SRAM Firmware driver defines

### 50.3.1 SRAM

***SRAM Exported Macros***

**\_\_HAL\_SRAM\_RESET\_HANDLE\_STATE** **Description:**

- Reset SRAM handle state.

**Parameters:**

- **\_\_HANDLE\_\_**: SRAM handle

**Return value:**

- None

## 51 HAL TIM Generic Driver

### 51.1 TIM Firmware driver registers structures

#### 51.1.1 TIM\_Base\_InitTypeDef

##### Data Fields

- *uint32\_t Prescaler*
- *uint32\_t CounterMode*
- *uint32\_t Period*
- *uint32\_t ClockDivision*
- *uint32\_t RepetitionCounter*
- *uint32\_t AutoReloadPreload*

##### Field Documentation

- ***uint32\_t TIM\_Base\_InitTypeDef::Prescaler***  
Specifies the prescaler value used to divide the TIM clock. This parameter can be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFFU
- ***uint32\_t TIM\_Base\_InitTypeDef::CounterMode***  
Specifies the counter mode. This parameter can be a value of [\*\*TIM\\_Counter\\_Mode\*\*](#)
- ***uint32\_t TIM\_Base\_InitTypeDef::Period***  
Specifies the period value to be loaded into the active Auto-Reload Register at the next update event. This parameter can be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFF.
- ***uint32\_t TIM\_Base\_InitTypeDef::ClockDivision***  
Specifies the clock division. This parameter can be a value of [\*\*TIM\\_ClockDivision\*\*](#)
- ***uint32\_t TIM\_Base\_InitTypeDef::RepetitionCounter***  
Specifies the repetition counter value. Each time the RCR downcounter reaches zero, an update event is generated and counting restarts from the RCR value (N). This means in PWM mode that (N+1U) corresponds to:the number of PWM periods in edge-aligned mode the number of half PWM period in center-aligned mode GP timers: this parameter must be a number between Min\_Data = 0x00 and Max\_Data = 0xFF. Advanced timers: this parameter must be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFF.
- ***uint32\_t TIM\_Base\_InitTypeDef::AutoReloadPreload***  
Specifies the auto-reload preload. This parameter can be a value of [\*\*TIM\\_AutoReloadPreload\*\*](#)

#### 51.1.2 TIM\_OC\_InitTypeDef

##### Data Fields

- *uint32\_t OCMode*
- *uint32\_t Pulse*
- *uint32\_t OCPolarity*
- *uint32\_t OCNPolarity*
- *uint32\_t OCFastMode*
- *uint32\_t OCIdleState*
- *uint32\_t OCNIdleState*

### Field Documentation

- **`uint32_t TIM_OC_InitTypeDef::OCMode`**  
Specifies the TIM mode. This parameter can be a value of  
[`TIMEx\_Output\_Compare\_and\_PWM\_modes`](#)
- **`uint32_t TIM_OC_InitTypeDef::Pulse`**  
Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFFU
- **`uint32_t TIM_OC_InitTypeDef::OCPolarity`**  
Specifies the output polarity. This parameter can be a value of  
[`TIM\_Output\_Compare\_Polarity`](#)
- **`uint32_t TIM_OC_InitTypeDef::OCNPolarity`**  
Specifies the complementary output polarity. This parameter can be a value of  
[`TIM\_Output\_Compare\_N\_Polarity`](#)  
**Note:**This parameter is valid only for TIM1 and TIM8.
- **`uint32_t TIM_OC_InitTypeDef::OCFastMode`**  
Specifies the Fast mode state. This parameter can be a value of  
[`TIM\_Output\_Fast\_State`](#)  
**Note:**This parameter is valid only in PWM1 and PWM2 mode.
- **`uint32_t TIM_OC_InitTypeDef::OCIdleState`**  
Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of  
[`TIM\_Output\_Compare\_Idle\_State`](#)  
**Note:**This parameter is valid only for TIM1 and TIM8.
- **`uint32_t TIM_OC_InitTypeDef::OCNIdleState`**  
Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of  
[`TIM\_Output\_Compare\_N\_Idle\_State`](#)  
**Note:**This parameter is valid only for TIM1 and TIM8.

### 51.1.3 `TIM_OnePulse_InitTypeDef`

#### Data Fields

- **`uint32_t OCMode`**
- **`uint32_t Pulse`**
- **`uint32_t OCPolarity`**
- **`uint32_t OCNPolarity`**
- **`uint32_t OCIdleState`**
- **`uint32_t OCNIdleState`**
- **`uint32_t IC_Polarity`**
- **`uint32_t IC_Selection`**
- **`uint32_t IC_Filter`**

#### Field Documentation

- **`uint32_t TIM_OnePulse_InitTypeDef::OCMode`**  
Specifies the TIM mode. This parameter can be a value of  
[`TIMEx\_Output\_Compare\_and\_PWM\_modes`](#)
- **`uint32_t TIM_OnePulse_InitTypeDef::Pulse`**  
Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFFU
- **`uint32_t TIM_OnePulse_InitTypeDef::OCPolarity`**  
Specifies the output polarity. This parameter can be a value of  
[`TIM\_Output\_Compare\_Polarity`](#)
- **`uint32_t TIM_OnePulse_InitTypeDef::OCNPolarity`**  
Specifies the complementary output polarity. This parameter can be a value of  
[`TIM\_Output\_Compare\_N\_Polarity`](#)  
**Note:**This parameter is valid only for TIM1 and TIM8.

- ***uint32\_t TIM\_OnePulse\_InitTypeDef::OCIdleState***  
Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of [\*\*TIM\\_Output\\_Compare\\_Idle\\_State\*\*](#)  
**Note:**This parameter is valid only for TIM1 and TIM8.
- ***uint32\_t TIM\_OnePulse\_InitTypeDef::OCNIdleState***  
Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of [\*\*TIM\\_Output\\_Compare\\_N\\_Idle\\_State\*\*](#)  
**Note:**This parameter is valid only for TIM1 and TIM8.
- ***uint32\_t TIM\_OnePulse\_InitTypeDef::ICPolarity***  
Specifies the active edge of the input signal. This parameter can be a value of [\*\*TIM\\_Input\\_Capture\\_Polarity\*\*](#)
- ***uint32\_t TIM\_OnePulse\_InitTypeDef::ICSelection***  
Specifies the input. This parameter can be a value of [\*\*TIM\\_Input\\_Capture\\_Selection\*\*](#)
- ***uint32\_t TIM\_OnePulse\_InitTypeDef::ICFilter***  
Specifies the input capture filter. This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU

#### 51.1.4 **TIM\_IC\_InitTypeDef**

##### Data Fields

- ***uint32\_t IC\_Polarity***
- ***uint32\_t IC\_Selection***
- ***uint32\_t IC\_Prescaler***
- ***uint32\_t IC\_Filter***

##### Field Documentation

- ***uint32\_t TIM\_IC\_InitTypeDef::ICPolarity***  
Specifies the active edge of the input signal. This parameter can be a value of [\*\*TIM\\_Input\\_Capture\\_Polarity\*\*](#)
- ***uint32\_t TIM\_IC\_InitTypeDef::ICSelection***  
Specifies the input. This parameter can be a value of [\*\*TIM\\_Input\\_Capture\\_Selection\*\*](#)
- ***uint32\_t TIM\_IC\_InitTypeDef::ICPrescaler***  
Specifies the Input Capture Prescaler. This parameter can be a value of [\*\*TIM\\_Input\\_Capture\\_Prescaler\*\*](#)
- ***uint32\_t TIM\_IC\_InitTypeDef::ICFilter***  
Specifies the input capture filter. This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU

#### 51.1.5 **TIM\_Encoder\_InitTypeDef**

##### Data Fields

- ***uint32\_t EncoderMode***
- ***uint32\_t IC1Polarity***
- ***uint32\_t IC1Selection***
- ***uint32\_t IC1Prescaler***
- ***uint32\_t IC1Filter***
- ***uint32\_t IC2Polarity***
- ***uint32\_t IC2Selection***
- ***uint32\_t IC2Prescaler***
- ***uint32\_t IC2Filter***

### Field Documentation

- **`uint32_t TIM_Encoder_InitTypeDef::EncoderMode`**  
Specifies the active edge of the input signal. This parameter can be a value of [`TIM\_Encoder\_Mode`](#)
- **`uint32_t TIM_Encoder_InitTypeDef::IC1Polarity`**  
Specifies the active edge of the input signal. This parameter can be a value of [`TIM\_Input\_Capture\_Polarity`](#)
- **`uint32_t TIM_Encoder_InitTypeDef::IC1Selection`**  
Specifies the input. This parameter can be a value of [`TIM\_Input\_Capture\_Selection`](#)
- **`uint32_t TIM_Encoder_InitTypeDef::IC1Prescaler`**  
Specifies the Input Capture Prescaler. This parameter can be a value of [`TIM\_Input\_Capture\_Prescaler`](#)
- **`uint32_t TIM_Encoder_InitTypeDef::IC1Filter`**  
Specifies the input capture filter. This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU
- **`uint32_t TIM_Encoder_InitTypeDef::IC2Polarity`**  
Specifies the active edge of the input signal. This parameter can be a value of [`TIM\_Input\_Capture\_Polarity`](#)
- **`uint32_t TIM_Encoder_InitTypeDef::IC2Selection`**  
Specifies the input. This parameter can be a value of [`TIM\_Input\_Capture\_Selection`](#)
- **`uint32_t TIM_Encoder_InitTypeDef::IC2Prescaler`**  
Specifies the Input Capture Prescaler. This parameter can be a value of [`TIM\_Input\_Capture\_Prescaler`](#)
- **`uint32_t TIM_Encoder_InitTypeDef::IC2Filter`**  
Specifies the input capture filter. This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU

### 51.1.6 `TIM_ClockConfigTypeDef`

#### Data Fields

- **`uint32_t ClockSource`**
- **`uint32_t ClockPolarity`**
- **`uint32_t ClockPrescaler`**
- **`uint32_t ClockFilter`**

#### Field Documentation

- **`uint32_t TIM_ClockConfigTypeDef::ClockSource`**  
TIM clock sources This parameter can be a value of [`TIM\_Clock\_Source`](#)
- **`uint32_t TIM_ClockConfigTypeDef::ClockPolarity`**  
TIM clock polarity This parameter can be a value of [`TIM\_Clock\_Polarity`](#)
- **`uint32_t TIM_ClockConfigTypeDef::ClockPrescaler`**  
TIM clock prescaler This parameter can be a value of [`TIM\_Clock\_Prescaler`](#)
- **`uint32_t TIM_ClockConfigTypeDef::ClockFilter`**  
TIM clock filter This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU

### 51.1.7 `TIM_ClearInputConfigTypeDef`

#### Data Fields

- **`uint32_t ClearInputState`**
- **`uint32_t ClearInputSource`**
- **`uint32_t ClearInputPolarity`**
- **`uint32_t ClearInputPrescaler`**

- *uint32\_t ClearInputFilter*

#### Field Documentation

- *uint32\_t TIM\_ClearInputConfigTypeDef::ClearInputState*  
TIM clear Input state This parameter can be ENABLE or DISABLE
- *uint32\_t TIM\_ClearInputConfigTypeDef::ClearInputSource*  
TIM clear Input sources This parameter can be a value of [TIMEEx\\_ClearInput\\_Source](#)
- *uint32\_t TIM\_ClearInputConfigTypeDef::ClearInputPolarity*  
TIM Clear Input polarity This parameter can be a value of [TIM\\_ClearInput\\_Polarity](#)
- *uint32\_t TIM\_ClearInputConfigTypeDef::ClearInputPrescaler*  
TIM Clear Input prescaler This parameter can be a value of [TIM\\_ClearInput\\_Prescaler](#)
- *uint32\_t TIM\_ClearInputConfigTypeDef::ClearInputFilter*  
TIM Clear Input filter This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU

### 51.1.8 TIM\_SlaveConfigTypeDef

#### Data Fields

- *uint32\_t SlaveMode*
- *uint32\_t InputTrigger*
- *uint32\_t TriggerPolarity*
- *uint32\_t TriggerPrescaler*
- *uint32\_t TriggerFilter*

#### Field Documentation

- *uint32\_t TIM\_SlaveConfigTypeDef::SlaveMode*  
Slave mode selection This parameter can be a value of [TIMEEx\\_Slave\\_Mode](#)
- *uint32\_t TIM\_SlaveConfigTypeDef::InputTrigger*  
Input Trigger source This parameter can be a value of [TIM\\_Trigger\\_Selection](#)
- *uint32\_t TIM\_SlaveConfigTypeDef::TriggerPolarity*  
Input Trigger polarity This parameter can be a value of [TIM\\_Trigger\\_Polarity](#)
- *uint32\_t TIM\_SlaveConfigTypeDef::TriggerPrescaler*  
Input trigger prescaler This parameter can be a value of [TIM\\_Trigger\\_Prescaler](#)
- *uint32\_t TIM\_SlaveConfigTypeDef::TriggerFilter*  
Input trigger filter This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU

### 51.1.9 TIM\_HandleTypeDef

#### Data Fields

- *TIM\_TypeDef \* Instance*
- *TIM\_Base\_InitTypeDef Init*
- *HAL\_TIM\_ActiveChannel Channel*
- *DMA\_HandleTypeDef \* hdma*
- *HAL\_LockTypeDef Lock*
- *\_\_IO HAL\_TIM\_StateTypeDef State*

#### Field Documentation

- *TIM\_TypeDef\* TIM\_HandleTypeDef::Instance*  
Register base address
- *TIM\_Base\_InitTypeDef TIM\_HandleTypeDef::Init*  
TIM Time Base required parameters

- ***HAL\_TIM\_ActiveChannel TIM\_HandleTypeDef::Channel***  
Active channel
- ***DMA\_HandleTypeDef\* TIM\_HandleTypeDef::hdma[7]***  
DMA Handlers array This array is accessed by a ***TIM\_DMA\_Handle\_index***
- ***HAL\_LockTypeDef TIM\_HandleTypeDef::Lock***  
Locking object
- ***\_\_IO HAL\_TIM\_StateTypeDef TIM\_HandleTypeDef::State***  
TIM operation state

## 51.2 TIM Firmware driver API description

### 51.2.1 TIMER Generic features

The Timer features include:

1. 16-bit up, down, up/down auto-reload counter.
2. 16-bit programmable prescaler allowing dividing (also on the fly) the counter clock frequency either by any factor between 1 and 65536.
3. Up to 4 independent channels for:
  - Input Capture
  - Output Compare
  - PWM generation (Edge and Center-aligned Mode)
  - One-pulse mode output

### 51.2.2 How to use this driver

1. Initialize the TIM low level resources by implementing the following functions depending from feature used :
  - Time Base : `HAL_TIM_Base_MspInit()`
  - Input Capture : `HAL_TIM_IC_MspInit()`
  - Output Compare : `HAL_TIM_OC_MspInit()`
  - PWM generation : `HAL_TIM_PWM_MspInit()`
  - One-pulse mode output : `HAL_TIM_OnePulse_MspInit()`
  - Encoder mode output : `HAL_TIM_Encoder_MspInit()`
2. Initialize the TIM low level resources :
  - a. Enable the TIM interface clock using `__HAL_RCC_TIMx_CLK_ENABLE()`;
  - b. TIM pins configuration
    - Enable the clock for the TIM GPIOs using the following function:  
`__HAL_RCC_GPIOx_CLK_ENABLE();`
    - Configure these TIM pins in Alternate function mode using `HAL_GPIO_Init()`;
3. The external Clock can be configured, if needed (the default clock is the internal clock from the APBx), using the following function: `HAL_TIM_ConfigClockSource`, the clock configuration should be done before any start function.
4. Configure the TIM in the desired functioning mode using one of the Initialization function of this driver:
  - `HAL_TIM_Base_Init`: to use the Timer to generate a simple time base
  - `HAL_TIM_OC_Init` and `HAL_TIM_OC_ConfigChannel`: to use the Timer to generate an Output Compare signal.
  - `HAL_TIM_PWM_Init` and `HAL_TIM_PWM_ConfigChannel`: to use the Timer to generate a PWM signal.
  - `HAL_TIM_IC_Init` and `HAL_TIM_IC_ConfigChannel`: to use the Timer to measure an external signal.
  - `HAL_TIM_OnePulse_Init` and `HAL_TIM_OnePulse_ConfigChannel`: to use the Timer in One Pulse Mode.
  - `HAL_TIM_Encoder_Init`: to use the Timer Encoder Interface.

5. Activate the TIM peripheral using one of the start functions depending from the feature used:
  - Time Base : HAL\_TIM\_Base\_Start(), HAL\_TIM\_Base\_Start\_DMA(),  
HAL\_TIM\_Base\_Start\_IT()
  - Input Capture : HAL\_TIM\_IC\_Start(), HAL\_TIM\_IC\_Start\_DMA(),  
HAL\_TIM\_IC\_Start\_IT()
  - Output Compare : HAL\_TIM\_OC\_Start(), HAL\_TIM\_OC\_Start\_DMA(),  
HAL\_TIM\_OC\_Start\_IT()
  - PWM generation : HAL\_TIM\_PWM\_Start(), HAL\_TIM\_PWM\_Start\_DMA(),  
HAL\_TIM\_PWM\_Start\_IT()
  - One-pulse mode output : HAL\_TIM\_OnePulse\_Start(),  
HAL\_TIM\_OnePulse\_Start\_IT()
  - Encoder mode output : HAL\_TIM\_Encoder\_Start(),  
HAL\_TIM\_Encoder\_Start\_DMA(), HAL\_TIM\_Encoder\_Start\_IT().
6. The DMA Burst is managed with the two following functions:  
HAL\_TIM\_DMABurst\_WriteStart() HAL\_TIM\_DMABurst\_ReadStart()

### 51.2.3 Time Base functions

This section provides functions allowing to:

- Initialize and configure the TIM base.
- De-initialize the TIM base.
- Start the Time Base.
- Stop the Time Base.
- Start the Time Base and enable interrupt.
- Stop the Time Base and disable interrupt.
- Start the Time Base and enable DMA transfer.
- Stop the Time Base and disable DMA transfer.

This section contains the following APIs:

- [\*HAL\\_TIM\\_Base\\_Init\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_DeInit\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_MspInit\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_MspDeInit\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_Start\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_Stop\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_Start\\_IT\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_Stop\\_IT\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_Start\\_DMA\(\)\*](#)
- [\*HAL\\_TIM\\_Base\\_Stop\\_DMA\(\)\*](#)

### 51.2.4 Time Output Compare functions

This section provides functions allowing to:

- Initialize and configure the TIM Output Compare.
- De-initialize the TIM Output Compare.
- Start the Time Output Compare.
- Stop the Time Output Compare.
- Start the Time Output Compare and enable interrupt.
- Stop the Time Output Compare and disable interrupt.
- Start the Time Output Compare and enable DMA transfer.
- Stop the Time Output Compare and disable DMA transfer.

This section contains the following APIs:

- [`HAL\_TIM\_OC\_Init\(\)`](#)
- [`HAL\_TIM\_OC\_DelInit\(\)`](#)
- [`HAL\_TIM\_OC\_MspInit\(\)`](#)
- [`HAL\_TIM\_OC\_MspDelInit\(\)`](#)
- [`HAL\_TIM\_OC\_Start\(\)`](#)
- [`HAL\_TIM\_OC\_Stop\(\)`](#)
- [`HAL\_TIM\_OC\_Start\_IT\(\)`](#)
- [`HAL\_TIM\_OC\_Stop\_IT\(\)`](#)
- [`HAL\_TIM\_OC\_Start\_DMA\(\)`](#)
- [`HAL\_TIM\_OC\_Stop\_DMA\(\)`](#)

### 51.2.5 Time PWM functions

This section provides functions allowing to:

- Initialize and configure the TIM OPWM.
- De-initialize the TIM PWM.
- Start the Time PWM.
- Stop the Time PWM.
- Start the Time PWM and enable interrupt.
- Stop the Time PWM and disable interrupt.
- Start the Time PWM and enable DMA transfer.
- Stop the Time PWM and disable DMA transfer.

This section contains the following APIs:

- [`HAL\_TIM\_PWM\_Init\(\)`](#)
- [`HAL\_TIM\_PWM\_DelInit\(\)`](#)
- [`HAL\_TIM\_PWM\_MspInit\(\)`](#)
- [`HAL\_TIM\_PWM\_MspDelInit\(\)`](#)
- [`HAL\_TIM\_PWM\_Start\(\)`](#)
- [`HAL\_TIM\_PWM\_Stop\(\)`](#)
- [`HAL\_TIM\_PWM\_Start\_IT\(\)`](#)
- [`HAL\_TIM\_PWM\_Stop\_IT\(\)`](#)
- [`HAL\_TIM\_PWM\_Start\_DMA\(\)`](#)
- [`HAL\_TIM\_PWM\_Stop\_DMA\(\)`](#)

### 51.2.6 Time Input Capture functions

This section provides functions allowing to:

- Initialize and configure the TIM Input Capture.
- De-initialize the TIM Input Capture.
- Start the Time Input Capture.
- Stop the Time Input Capture.
- Start the Time Input Capture and enable interrupt.
- Stop the Time Input Capture and disable interrupt.
- Start the Time Input Capture and enable DMA transfer.
- Stop the Time Input Capture and disable DMA transfer.

This section contains the following APIs:

- [`HAL\_TIM\_IC\_Init\(\)`](#)
- [`HAL\_TIM\_IC\_DelInit\(\)`](#)
- [`HAL\_TIM\_IC\_MspInit\(\)`](#)

- [`HAL\_TIM\_IC\_MspDeInit\(\)`](#)
- [`HAL\_TIM\_IC\_Start\(\)`](#)
- [`HAL\_TIM\_IC\_Stop\(\)`](#)
- [`HAL\_TIM\_IC\_Start\_IT\(\)`](#)
- [`HAL\_TIM\_IC\_Stop\_IT\(\)`](#)
- [`HAL\_TIM\_IC\_Start\_DMA\(\)`](#)
- [`HAL\_TIM\_IC\_Stop\_DMA\(\)`](#)

### 51.2.7 Time One Pulse functions

This section provides functions allowing to:

- Initialize and configure the TIM One Pulse.
- De-initialize the TIM One Pulse.
- Start the Time One Pulse.
- Stop the Time One Pulse.
- Start the Time One Pulse and enable interrupt.
- Stop the Time One Pulse and disable interrupt.
- Start the Time One Pulse and enable DMA transfer.
- Stop the Time One Pulse and disable DMA transfer.

This section contains the following APIs:

- [`HAL\_TIM\_OnePulse\_Init\(\)`](#)
- [`HAL\_TIM\_OnePulse\_DeInit\(\)`](#)
- [`HAL\_TIM\_OnePulse\_MspInit\(\)`](#)
- [`HAL\_TIM\_OnePulse\_MspDeInit\(\)`](#)
- [`HAL\_TIM\_OnePulse\_Start\(\)`](#)
- [`HAL\_TIM\_OnePulse\_Stop\(\)`](#)
- [`HAL\_TIM\_OnePulse\_Start\_IT\(\)`](#)
- [`HAL\_TIM\_OnePulse\_Stop\_IT\(\)`](#)

### 51.2.8 Time Encoder functions

This section provides functions allowing to:

- Initialize and configure the TIM Encoder.
- De-initialize the TIM Encoder.
- Start the Time Encoder.
- Stop the Time Encoder.
- Start the Time Encoder and enable interrupt.
- Stop the Time Encoder and disable interrupt.
- Start the Time Encoder and enable DMA transfer.
- Stop the Time Encoder and disable DMA transfer.

This section contains the following APIs:

- [`HAL\_TIM\_Encoder\_Init\(\)`](#)
- [`HAL\_TIM\_Encoder\_DeInit\(\)`](#)
- [`HAL\_TIM\_Encoder\_MspInit\(\)`](#)
- [`HAL\_TIM\_Encoder\_MspDeInit\(\)`](#)
- [`HAL\_TIM\_Encoder\_Start\(\)`](#)
- [`HAL\_TIM\_Encoder\_Stop\(\)`](#)
- [`HAL\_TIM\_Encoder\_Start\_IT\(\)`](#)
- [`HAL\_TIM\_Encoder\_Stop\_IT\(\)`](#)
- [`HAL\_TIM\_Encoder\_Start\_DMA\(\)`](#)
- [`HAL\_TIM\_Encoder\_Stop\_DMA\(\)`](#)

### 51.2.9 IRQ handler management

This section provides Timer IRQ handler function.

This section contains the following APIs:

- [\*HAL\\_TIM\\_IRQHandler\(\)\*](#)

### 51.2.10 Peripheral Control functions

This section provides functions allowing to:

- Configure The Input Output channels for OC, PWM, IC or One Pulse mode.
- Configure External Clock source.
- Configure Complementary channels, break features and dead time.
- Configure Master and the Slave synchronization.
- Configure the DMA Burst Mode.

This section contains the following APIs:

- [\*HAL\\_TIM\\_OC\\_ConfigChannel\(\)\*](#)
- [\*HAL\\_TIM\\_IC\\_ConfigChannel\(\)\*](#)
- [\*HAL\\_TIM\\_PWM\\_ConfigChannel\(\)\*](#)
- [\*HAL\\_TIM\\_OnePulse\\_ConfigChannel\(\)\*](#)
- [\*HAL\\_TIM\\_DMABurst\\_WriteStart\(\)\*](#)
- [\*HAL\\_TIM\\_DMABurst\\_MultiWriteStart\(\)\*](#)
- [\*HAL\\_TIM\\_DMABurst\\_WriteStop\(\)\*](#)
- [\*HAL\\_TIM\\_DMABurst\\_ReadStart\(\)\*](#)
- [\*HAL\\_TIM\\_DMABurst\\_MultiReadStart\(\)\*](#)
- [\*HAL\\_TIM\\_DMABurst\\_ReadStop\(\)\*](#)
- [\*HAL\\_TIM\\_GenerateEvent\(\)\*](#)
- [\*HAL\\_TIM\\_ConfigOCrefClear\(\)\*](#)
- [\*HAL\\_TIM\\_ConfigClockSource\(\)\*](#)
- [\*HAL\\_TIM\\_ConfigTI1Input\(\)\*](#)
- [\*HAL\\_TIM\\_SlaveConfigSynchronization\(\)\*](#)
- [\*HAL\\_TIM\\_SlaveConfigSynchronization\\_IT\(\)\*](#)
- [\*HAL\\_TIM\\_ReadCapturedValue\(\)\*](#)

### 51.2.11 TIM Callbacks functions

This section provides TIM callback functions:

- Timer Period elapsed callback
- Timer Output Compare callback
- Timer Input capture callback
- Timer Trigger callback
- Timer Error callback

This section contains the following APIs:

- [\*HAL\\_TIM\\_PeriodElapsedCallback\(\)\*](#)
- [\*HAL\\_TIM\\_OC\\_DelayElapsedCallback\(\)\*](#)
- [\*HAL\\_TIM\\_IC\\_CaptureCallback\(\)\*](#)
- [\*HAL\\_TIM\\_PWM\\_PulseFinishedCallback\(\)\*](#)
- [\*HAL\\_TIM\\_TriggerCallback\(\)\*](#)
- [\*HAL\\_TIM\\_ErrorCallback\(\)\*](#)

### 51.2.12 Peripheral State functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- [`HAL\_TIM\_Base\_GetState\(\)`](#)
- [`HAL\_TIM\_OC\_GetState\(\)`](#)
- [`HAL\_TIM\_PWM\_GetState\(\)`](#)
- [`HAL\_TIM\_IC\_GetState\(\)`](#)
- [`HAL\_TIM\_OnePulse\_GetState\(\)`](#)
- [`HAL\_TIM\_Encoder\_GetState\(\)`](#)

### 51.2.13 Detailed description of functions

#### `HAL_TIM_Base_Init`

|                      |                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <code>HAL_StatusTypeDef HAL_TIM_Base_Init (TIM_HandleTypeDef * htim)</code>                                                                      |
| Function description | Initializes the TIM Time base Unit according to the specified parameters in the <code>TIM_HandleTypeDef</code> and create the associated handle. |
| Parameters           | <ul style="list-style-type: none"><li>• <code>htim</code>: TIM Base handle</li></ul>                                                             |
| Return values        | <ul style="list-style-type: none"><li>• <code>HAL</code>: status</li></ul>                                                                       |

#### `HAL_TIM_Base_DeInit`

|                      |                                                                                      |
|----------------------|--------------------------------------------------------------------------------------|
| Function name        | <code>HAL_StatusTypeDef HAL_TIM_Base_DeInit (TIM_HandleTypeDef * htim)</code>        |
| Function description | DeInitializes the TIM Base peripheral.                                               |
| Parameters           | <ul style="list-style-type: none"><li>• <code>htim</code>: TIM Base handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <code>HAL</code>: status</li></ul>           |

#### `HAL_TIM_Base_MspInit`

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| Function name        | <code>void HAL_TIM_Base_MspInit (TIM_HandleTypeDef * htim)</code>               |
| Function description | Initializes the TIM Base MSP.                                                   |
| Parameters           | <ul style="list-style-type: none"><li>• <code>htim</code>: TIM handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <code>None</code></li></ul>             |

#### `HAL_TIM_Base_MspDeInit`

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| Function name        | <code>void HAL_TIM_Base_MspDeInit (TIM_HandleTypeDef * htim)</code>             |
| Function description | DeInitializes TIM Base MSP.                                                     |
| Parameters           | <ul style="list-style-type: none"><li>• <code>htim</code>: TIM handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <code>None</code></li></ul>             |

**HAL\_TIM\_Base\_Start**

|                      |                                                                            |
|----------------------|----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_TIM_Base_Start<br/>(TIM_HandleTypeDef * htim)</b> |
| Function description | Starts the TIM Base generation.                                            |
| Parameters           | <ul style="list-style-type: none"><li>• <b>htim:</b> TIM handle</li></ul>  |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>       |

**HAL\_TIM\_Base\_Stop**

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_TIM_Base_Stop<br/>(TIM_HandleTypeDef * htim)</b> |
| Function description | Stops the TIM Base generation.                                            |
| Parameters           | <ul style="list-style-type: none"><li>• <b>htim:</b> TIM handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>      |

**HAL\_TIM\_Base\_Start\_IT**

|                      |                                                                               |
|----------------------|-------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_TIM_Base_Start_IT<br/>(TIM_HandleTypeDef * htim)</b> |
| Function description | Starts the TIM Base generation in interrupt mode.                             |
| Parameters           | <ul style="list-style-type: none"><li>• <b>htim:</b> TIM handle</li></ul>     |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>          |

**HAL\_TIM\_Base\_Stop\_IT**

**HAL\_TIM\_Base\_Stop\_DMA**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_Base\_Stop\_DMA  
(TIM\_HandleTypeDef \* htim)**

Function description      Stops the TIM Base generation in DMA mode.

Parameters      • **htim:** TIM handle

Return values      • **HAL:** status

**HAL\_TIM\_OC\_Init**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_OC\_Init (TIM\_HandleTypeDef \* htim)**

Function description      Initializes the TIM Output Compare according to the specified parameters in the TIM\_HandleTypeDef and create the associated handle.

Parameters      • **htim:** TIM Output Compare handle

Return values      • **HAL:** status

**HAL\_TIM\_OC\_DelInit**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_OC\_DelInit  
(TIM\_HandleTypeDef \* htim)**

Function description      Delinitializes the TIM peripheral.

Parameters      • **htim:** TIM Output Compare handle

Return values      • **HAL:** status

**HAL\_TIM\_OC\_MspInit**

Function name      **void HAL\_TIM\_OC\_MspInit (TIM\_HandleTypeDef \* htim)**

Function description      Initializes the TIM Output Compare MSP.

Parameters      • **htim:** TIM handle

Return values      • **None**

**HAL\_TIM\_OC\_MspDelInit**

Function name      **void HAL\_TIM\_OC\_MspDelInit (TIM\_HandleTypeDef \* htim)**

Function description      Delinitializes TIM Output Compare MSP.

Parameters      • **htim:** TIM handle

Return values      • **None**

**HAL\_TIM\_OC\_Start**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_OC\_Start (TIM\_HandleTypeDef  
\* htim, uint32\_t Channel)**

Function description      Starts the TIM Output Compare signal generation.

**HAL\_TIM\_PWM\_DeInit**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_PWM\_DeInit  
(TIM\_HandleTypeDef \* htim)**

Function description      DeInitializes the TIM peripheral.

Parameters      • **htim:** TIM handle

Return values      • **HAL:** status

**HAL\_TIM\_PWM\_MspInit**

Function name      **void HAL\_TIM\_PWM\_MspInit (TIM\_HandleTypeDef \* htim)**

Function description      Initializes the TIM PWM MSP.

Parameters      • **htim:** TIM handle

Return values      • **None**

**HAL\_TIM\_PWM\_MspDeInit**

Function name      **void HAL\_TIM\_PWM\_MspDeInit (TIM\_HandleTypeDef \* htim)**

Function description      DeInitializes TIM PWM MSP.

Parameters      • **htim:** TIM handle

Return values      • **None**

**HAL\_TIM\_PWM\_Start**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_PWM\_Start  
(TIM\_HandleTypeDef \* htim, uint32\_t Channel)**

Function description      Starts the PWM signal generation.

Parameters      • **htim:** TIM handle  
• **Channel:** TIM Channels to be enabled This parameter can be one of the following values:  
– TIM\_CHANNEL\_1: TIM Channel 1 selected  
– TIM\_CHANNEL\_2: TIM Channel 2 selected  
– TIM\_CHANNEL\_3: TIM Channel 3 selected  
– TIM\_CHANNEL\_4: TIM Channel 4 selected

Return values      • **HAL:** status

**HAL\_TIM\_PWM\_Stop**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_PWM\_Stop  
(TIM\_HandleTypeDef \* htim, uint32\_t Channel)**

Function description      Stops the PWM signal generation.

Parameters      • **htim:** TIM handle  
• **Channel:** TIM Channels to be disabled This parameter can be one of the following values:  
– TIM\_CHANNEL\_1: TIM Channel 1 selected  
– TIM\_CHANNEL\_2: TIM Channel 2 selected  
– TIM\_CHANNEL\_3: TIM Channel 3 selected

### HAL\_TIM\_OnePulse\_Init

|                      |                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_TIM_OnePulse_Init<br/>(TIM_HandleTypeDef * htim, uint32_t OnePulseMode)</b>                                                           |
| Function description | Initializes the TIM One Pulse Time Base according to the specified parameters in the TIM_HandleTypeDef and create the associated handle.                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM OnePulse handle</li> <li>• <b>OnePulseMode:</b> Select the One pulse mode. This parameter</li> </ul> |

can be one of the following values:

- TIM\_OPMODE\_SINGLE: Only one pulse will be generated.
- TIM\_OPMODE\_REPETITIVE: Repetitive pulses will be generated.

Return values

- **HAL:** status

### **HAL\_TIM\_OnePulse\_DelInit**

Function name

**HAL\_StatusTypeDef HAL\_TIM\_OnePulse\_DelInit  
(TIM\_HandleTypeDef \* htim)**

Function description

DeInitializes the TIM One Pulse.

Parameters

- **htim:** TIM One Pulse handle

Return values

- **HAL:** status

### **HAL\_TIM\_OnePulse\_MspInit**

Function name

**void HAL\_TIM\_OnePulse\_MspInit (TIM\_HandleTypeDef \* htim)**

Function description

Initializes the TIM One Pulse MSP.

Parameters

- **htim:** TIM handle

Return values

- **None**

### **HAL\_TIM\_OnePulse\_MspDelInit**

Function name

**void HAL\_TIM\_OnePulse\_MspDelInit (TIM\_HandleTypeDef \* htim)**

Function description

DeInitializes TIM One Pulse MSP.

Parameters

- **htim:** TIM handle

Return values

- **None**

### **HAL\_TIM\_OnePulse\_Start**

Function name

**HAL\_StatusTypeDef HAL\_TIM\_OnePulse\_Start  
(TIM\_HandleTypeDef \* htim, uint32\_t OutputChannel)**

Function description

Starts the TIM One Pulse signal generation.

Parameters

- **htim:** TIM One Pulse handle
- **OutputChannel:** TIM Channels to be enabled This parameter can be one of the following values:
  - TIM\_CHANNEL\_1: TIM Channel 1 selected
  - TIM\_CHANNEL\_2: TIM Channel 2 selected

Return values

- **HAL:** status

### **HAL\_TIM\_OnePulse\_Stop**

Function name

**HAL\_StatusTypeDef HAL\_TIM\_OnePulse\_Stop  
(TIM\_HandleTypeDef \* htim, uint32\_t OutputChannel)**

**HAL\_TIM\_Encoder\_DelInit**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_Encoder\_DelInit  
(TIM\_HandleTypeDef \* htim)**

Function description      DelInitializes the TIM Encoder interface.

Parameters      • **htim:** TIM Encoder handle

Return values      • **HAL:** status

**HAL\_TIM\_Encoder\_MspInit**

Function name      **void HAL\_TIM\_Encoder\_MspInit (TIM\_HandleTypeDef \* htim)**

Function description      Initializes the TIM Encoder Interface MSP.

Parameters      • **htim:** TIM handle

Return values      • **None**

**HAL\_TIM\_Encoder\_MspDeInit**

Function name      **void HAL\_TIM\_Encoder\_MspDeInit (TIM\_HandleTypeDef \* htim)**

Function description      DelInitializes TIM Encoder Interface MSP.

Parameters      • **htim:** TIM handle

Return values      • **None**

**HAL\_TIM\_Encoder\_Start**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_Encoder\_Start  
(TIM\_HandleTypeDef \* htim, uint32\_t Channel)**

Function description      Starts the TIM Encoder Interface.

Parameters      • **htim:** TIM Encoder Interface handle  
• **Channel:** TIM Channels to be enabled This parameter can be one of the following values:  
– **TIM\_CHANNEL\_1:** TIM Channel 1 selected  
– **TIM\_CHANNEL\_2:** TIM Channel 2 selected  
– **TIM\_CHANNEL\_ALL:** TIM Channel 1 and TIM Channel 2 are selected

Return values      • **HAL:** status

**HAL\_TIM\_Encoder\_Stop**

Function name      **HAL\_StatusTypeDef HAL\_TIM\_Encoder\_Stop  
(TIM\_HandleTypeDef \* htim, uint32\_t Channel)**

Function description      Stops the TIM Encoder Interface.

Parameters      • **htim:** TIM Encoder Interface handle  
• **Channel:** TIM Channels to be disabled This parameter can be one of the following values:  
– **TIM\_CHANNEL\_1:** TIM Channel 1 selected  
– **TIM\_CHANNEL\_2:** TIM Channel 2 selected

- TIM\_CHANNEL\_4: TIM Channel 4 selected

Return values

- **Captured:** value

### **HAL\_TIM\_PeriodElapsedCallback**

Function name **void HAL\_TIM\_PeriodElapsedCallback (TIM\_HandleTypeDef \* htim)**

Function description Period elapsed callback in non blocking mode.

Parameters

- **htim:** TIM handle

Return values

- **None**

### **HAL\_TIM\_OC\_DelayElapsedCallback**

Function name **void HAL\_TIM\_OC\_DelayElapsedCallback (TIM\_HandleTypeDef \* htim)**

Function description Output Compare callback in non blocking mode.

Parameters

- **htim:** TIM OC handle

Return values

- **None**

### **HAL\_TIM\_IC\_CaptureCallback**

Function name **void HAL\_TIM\_IC\_CaptureCallback (TIM\_HandleTypeDef \* htim)**

Function description Input Capture callback in non blocking mode.

Parameters

- **htim:** TIM IC handle

Return values

- **None**

### **HAL\_TIM\_PWM\_PulseFinishedCallback**

Function name **void HAL\_TIM\_PWM\_PulseFinishedCallback (TIM\_HandleTypeDef \* htim)**

Function description PWM Pulse finished callback in non blocking mode.

Parameters

- **htim:** TIM handle

Return values

- **None**

### **HAL\_TIM\_TriggerCallback**

Function name **void HAL\_TIM\_TriggerCallback (TIM\_HandleTypeDef \* htim)**

Function description Hall Trigger detection callback in non blocking mode.

Parameters

- **htim:** TIM handle

Return values

- **None**

**HAL\_TIM\_ErrorCallback**

TIM\_DMA\_COM  
TIM\_DMA\_TRIGGER

***TIM Encoder Mode***

`TIM_ENCODERMODE_TI1`  
`TIM_ENCODERMODE_TI2`  
`TIM_ENCODERMODE_TI12`

***TIM ETR Polarity***

`TIM_ETRPOLARITY_INVERTED`      Polarity for ETR source  
`TIM_ETRPOLARITY_NONINVERTED`    Polarity for ETR source

***TIM ETR Prescaler***

`TIM_ETRPRESCALER_DIV1`    No prescaler is used  
`TIM_ETRPRESCALER_DIV2`    ETR input source is divided by 2U  
`TIM_ETRPRESCALER_DIV4`    ETR input source is divided by 4U  
`TIM_ETRPRESCALER_DIV8`    ETR input source is divided by 8U

***TIMEx Event Source***

|                                      |                                                                   |
|--------------------------------------|-------------------------------------------------------------------|
| <code>TIM_EVENTSOURCE_UPDATE</code>  | Reinitialize the counter and generates an update of the registers |
| <code>TIM_EVENTSOURCE_CC1</code>     | A capture/compare event is generated on channel 1U                |
| <code>TIM_EVENTSOURCE_CC2</code>     | A capture/compare event is generated on channel 2U                |
| <code>TIM_EVENTSOURCE_CC3</code>     | A capture/compare event is generated on channel 3U                |
| <code>TIM_EVENTSOURCE_CC4</code>     | A capture/compare event is generated on channel 4U                |
| <code>TIM_EVENTSOURCE_COM</code>     | A commutation event is generated                                  |
| <code>TIM_EVENTSOURCE_TRIGGER</code> | A trigger event is generated                                      |
| <code>TIM_EVENTSOURCE_BREAK</code>   | A break event is generated                                        |
| <code>TIM_EVENTSOURCE_BREAK2</code>  | A break 2 event is generated                                      |

***TIM Exported Macros***

|                                          |                                                                                                                                                                                                                                                                                                        |

- TIM\_IT\_UPDATE: Update interrupt
- TIM\_IT\_CC1: Capture/Compare 1 interrupt
- TIM\_IT\_CC2: Capture/Compare 2 interrupt
- TIM\_IT\_CC3: Capture/Compare 3 interrupt
- TIM\_IT\_CC4: Capture/Compare 4 interrupt
- TIM\_IT\_COM: Commutation interrupt
- TIM\_IT\_TRIGGER: Trigger interrupt
- TIM\_IT\_BREAK: Break interrupt

**Return value:**

- None

`__HAL_TIM_DISABLE_IT`

**Description:**

- Disables the specified TIM interrupt.

**Parameters:**

- `__HANDLE__`: specifies the TIM Handle.
- `__INTERRUPT__`: specifies the TIM interrupt source to disable. This parameter can be one of the following values:
  - TIM\_IT\_UPDATE: Update interrupt
  - TIM\_IT\_CC1: Capture/Compare 1 interrupt
  - TIM\_IT\_CC2: Capture/Compare 2 interrupt
  - TIM\_IT\_CC3: Capture/Compare 3 interrupt
  - TIM\_IT\_CC4: Capture/Compare 4 interrupt
  - TIM\_IT\_COM: Commutation interrupt
  - TIM\_IT\_TRIGGER: Trigger interrupt
  - TIM\_IT\_BREAK: Break interrupt

**Return value:**

- None

`__HAL_TIM_ENABLE_DMA`

**Description:**

- Enables the specified DMA request.

**Parameters:**

- `__HANDLE__`: specifies the TIM Handle.
- `__DMA__`: specifies the TIM DMA request to enable. This parameter can be one of the following values:
  - TIM\_DMA\_UPDATE: Update DMA request
  - TIM\_DMA\_CC1: Capture/Compare 1 DMA request
  - TIM\_DMA\_CC2: Capture/Compare 2 DMA request

- TIM\_DMA\_CC3: Capture/Compare 3 DMA request
- TIM\_DMA\_CC4: Capture/Compare 4 DMA request
- TIM\_DMA\_COM: Commutation DMA request
- TIM\_DMA\_TRIGGER: Trigger DMA request

**Return value:**

- None

`_HAL_TIM_DISABLE_DMA`

**Description:**

- Disables the specified DMA request.

**Parameters:**

- `_HANDLE_`: specifies the TIM Handle.
- `_DMA_`: specifies the TIM DMA request to disable. This parameter can be one of the following values:
  - TIM\_DMA\_UPDATE: Update DMA request
  - TIM\_DMA\_CC1: Capture/Compare 1 DMA request
  - TIM\_DMA\_CC2: Capture/Compare 2 DMA request
  - TIM\_DMA\_CC3: Capture/Compare 3 DMA request
  - TIM\_DMA\_CC4: Capture/Compare 4 DMA request
  - TIM\_DMA\_COM: Commutation DMA request
  - TIM\_DMA\_TRIGGER: Trigger DMA request

**Return value:**

- None

`_HAL_TIM_GET_FLAG`

**Description:**

- Checks whether the specified TIM interrupt flag is set or not.

**Parameters:**

- `_HANDLE_`: specifies the TIM Handle.
- `_FLAG_`: specifies the TIM interrupt flag to check. This parameter can be one of the following values:
  - TIM\_FLAG\_UPDATE: Update interrupt flag
  - TIM\_FLAG\_CC1: Capture/Compare 1 interrupt flag
  - TIM\_FLAG\_CC2: Capture/Compare 2 interrupt flag
  - TIM\_FLAG\_CC3: Capture/Compare 3 interrupt flag

- interrupt flag
- TIM\_FLAG\_CC4: Capture/Compare 4 interrupt flag
- TIM\_FLAG\_COM: Commutation interrupt flag
- TIM\_FLAG\_TRIGGER: Trigger interrupt flag
- TIM\_FLAG\_BREAK: Break interrupt flag
- TIM\_FLAG\_CC1OF: Capture/Compare 1 overcapture flag
- TIM\_FLAG\_CC2OF: Capture/Compare 2 overcapture flag
- TIM\_FLAG\_CC3OF: Capture/Compare 3 overcapture flag
- TIM\_FLAG\_CC4OF: Capture/Compare 4 overcapture flag

**Return value:**

- The new state of `__FLAG__` (TRUE or FALSE).

**\_HAL\_TIM\_CLEAR\_FLAG****Description:**

- Clears the specified TIM interrupt flag.

**Parameters:**

- `__HANDLE__`: specifies the TIM Handle.
- `__FLAG__`: specifies the TIM interrupt flag to clear. This parameter can be one of the following values:
  - TIM\_FLAG\_UPDATE: Update interrupt flag
  - TIM\_FLAG\_CC1: Capture/Compare 1 interrupt flag
  - TIM\_FLAG\_CC2: Capture/Compare 2 interrupt flag
  - TIM\_FLAG\_CC3: Capture/Compare 3 interrupt flag
  - TIM\_FLAG\_CC4: Capture/Compare 4 interrupt flag
  - TIM\_FLAG\_COM: Commutation interrupt flag
  - TIM\_FLAG\_TRIGGER: Trigger interrupt flag
  - TIM\_FLAG\_BREAK: Break interrupt flag
  - TIM\_FLAG\_CC1OF: Capture/Compare 1 overcapture flag
  - TIM\_FLAG\_CC2OF: Capture/Compare 2 overcapture flag
  - TIM\_FLAG\_CC3OF: Capture/Compare 3 overcapture flag
  - TIM\_FLAG\_CC4OF:

---

Capture/Compare 4 overcapture flag

**Return value:**

- The: new state of \_\_FLAG\_\_ (TRUE or FALSE).

`__HAL_TIM_GET_IT_SOURCE`

**Description:**

- Checks whether the specified TIM interrupt has occurred or not.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle
- \_\_INTERRUPT\_\_: specifies the TIM interrupt source to check.

**Return value:**

- The: state of TIM\_IT (SET or RESET).

`__HAL_TIM_CLEAR_IT`

**Description:**

- Clear the TIM interrupt pending bits.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle
- \_\_INTERRUPT\_\_: specifies the interrupt pending bit to clear.

**Return value:**

- None

`__HAL_TIM_IS_TIM_COUNTING_DOWN`

**Description:**

- Indicates whether or not the TIM Counter is used as downcounter.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle.

**Return value:**

- False: (Counter used as upcounter) or True (Counter used as downcounter)

**Notes:**

- This macro is particularly usefull to get the counting mode when the timer operates in Center-aligned mode or Encoder mode.

`__HAL_TIM_SET_PRESCALER`

**Description:**

- Sets the TIM active prescaler register value on update event.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle.
- \_\_PRESC\_\_: specifies the active prescaler register new value.

\_\_HAL\_TIM\_SET\_COUNTER**Return value:**

- None

**Description:**

- Sets the TIM Counter Register value on runtime.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle.
- \_\_COUNTER\_\_: specifies the Counter register new value.

**Return value:**

- None

\_\_HAL\_TIM\_GET\_COUNTER**Description:**

- Gets the TIM Counter Register value on runtime.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle.

**Return value:**

- 16-bit: or 32-bit value of the timer counter register (TIMx\_CNT)

\_\_HAL\_TIM\_SET\_AUTORELOAD**Description:**

- Sets the TIM Autoreload Register value on runtime without calling another time any Init function.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle.
- \_\_AUTORELOAD\_\_: specifies the Counter register new value.

**Return value:**

- None

\_\_HAL\_TIM\_GET\_AUTORELOAD**Description:**

- Gets the TIM Autoreload Register value on runtime.

**Parameters:**

- \_\_HANDLE\_\_: TIM handle.

**Return value:**

- 16-bit: or 32-bit value of the timer auto-reload register(TIMx\_ARR)

[\\_\\_HAL\\_TIM\\_SET\\_CLOCKDIVISION](#)**Description:**

- Sets the TIM Clock Division value on runtime without calling another time any Init function.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): TIM handle.
- [\\_\\_CKD\\_\\_](#): specifies the clock division value. This parameter can be one of the following value:
  - [TIM\\_CLOCKDIVISION\\_DIV1](#): tDTS=tCK\_INT
  - [TIM\\_CLOCKDIVISION\\_DIV2](#): tDTS=2\*tCK\_INT
  - [TIM\\_CLOCKDIVISION\\_DIV4](#): tDTS=4\*tCK\_INT

**Return value:**

- None

[\\_\\_HAL\\_TIM\\_GET\\_CLOCKDIVISION](#)**Description:**

- Gets the TIM Clock Division value on runtime.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): TIM handle.

**Return value:**

- The: clock division can be one of the following values:
  - [TIM\\_CLOCKDIVISION\\_DIV1](#): tDTS=tCK\_INT
  - [TIM\\_CLOCKDIVISION\\_DIV2](#): tDTS=2\*tCK\_INT
  - [TIM\\_CLOCKDIVISION\\_DIV4](#): tDTS=4\*tCK\_INT

[\\_\\_HAL\\_TIM\\_SET\\_ICPRESCALER](#)**Description:**

- Sets the TIM Input Capture prescaler on runtime without calling another time

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): TIM handle.
- [\\_\\_CHANNEL\\_\\_](#): TIM Channels to be configured. This parameter can be one of the following values:
  - [TIM\\_CHANNEL\\_1](#): TIM Channel 1 selected
  - [TIM\\_CHANNEL\\_2](#): TIM Channel 2 selected
  - [TIM\\_CHANNEL\\_3](#): TIM Channel 3 selected
  - [TIM\\_CHANNEL\\_4](#): TIM Channel 4

- selected
  - ICPSC: specifies the Input Capture4 prescaler new value. This parameter can be one of the following values:
    - TIM\_ICPSC\_DIV1: no prescaler
    - TIM\_ICPSC\_DIV2: capture is done once every 2 events
    - TIM\_ICPSC\_DIV4: capture is done once every 4 events
    - TIM\_ICPSC\_DIV8: capture is done once every 8 events

**Return value:**

- None

**Description:**

- Gets the TIM Input Capture prescaler on runtime.

**Parameters:**

- HANDLE: TIM handle.
- CHANNEL: TIM Channels to be configured. This parameter can be one of the following values:
  - TIM\_CHANNEL\_1: get input capture 1 prescaler value
  - TIM\_CHANNEL\_2: get input capture 2 prescaler value
  - TIM\_CHANNEL\_3: get input capture 3 prescaler value
  - TIM\_CHANNEL\_4: get input capture 4 prescaler value

**Return value:**

- The input capture prescaler can be one of the following values:
  - TIM\_ICPSC\_DIV1: no prescaler
  - TIM\_ICPSC\_DIV2: capture is done once every 2 events
  - TIM\_ICPSC\_DIV4: capture is done once every 4 events
  - TIM\_ICPSC\_DIV8: capture is done once every 8 events

\_HAL\_TIM\_URS\_ENABLE

**Description:**

- Set the Update Request Source (URS) bit of the TIMx\_CR1 register.

**Parameters:**

- HANDLE: TIM handle.

**Return value:**

- None

**Notes:**

- When the USR bit of the TIMx\_CR1 register is set, only counter overflow/underflow generates an update interrupt or DMA request (if enabled)

[\\_\\_HAL\\_TIM\\_URS\\_DISABLE](#)**Description:**

- Reset the Update Request Source (URS) bit of the TIMx\_CR1 register.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): TIM handle.

**Return value:**

- None

**Notes:**

- When the USR bit of the TIMx\_CR1 register is reset, any of the following events generate an update interrupt or DMA request (if enabled): (+) Counter overflow/underflow (+) Setting the UG bit (+) Update generation through the slave mode controller

[\\_\\_HAL\\_TIM\\_SET\\_CAPTURE\\_POLARITY](#)**Description:**

- Sets the TIM Capture x input polarity on runtime.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): TIM handle.
- [\\_\\_CHANNEL\\_\\_](#): TIM Channels to be configured. This parameter can be one of the following values:
  - [TIM\\_CHANNEL\\_1](#): TIM Channel 1 selected
  - [TIM\\_CHANNEL\\_2](#): TIM Channel 2 selected
  - [TIM\\_CHANNEL\\_3](#): TIM Channel 3 selected
  - [TIM\\_CHANNEL\\_4](#): TIM Channel 4 selected
- [\\_\\_POLARITY\\_\\_](#): Polarity for TIx source
  - [TIM\\_INPUTCHANNELPOLARITY\\_RISING](#): Rising Edge
  - [TIM\\_INPUTCHANNELPOLARITY\\_FALLING](#): Falling Edge
  - [TIM\\_INPUTCHANNELPOLARITY\\_BOTHEDGE](#): Rising and Falling Edge

**Return value:**

- None

## 52 HAL TIM Extension Driver

### 52.1 TIME Firmware driver registers structures

#### 52.1.1 TIM\_HallSensor\_InitTypeDef

##### Data Fields

- *uint32\_t IC1Polarity*
- *uint32\_t IC1Prescaler*
- *uint32\_t IC1Filter*
- *uint32\_t Commutation\_Delay*

##### Field Documentation

- ***uint32\_t TIM\_HallSensor\_InitTypeDef::IC1Polarity***  
Specifies the active edge of the input signal. This parameter can be a value of [\*TIM\\_Input\\_Capture\\_Polarity\*](#)
- ***uint32\_t TIM\_HallSensor\_InitTypeDef::IC1Prescaler***  
Specifies the Input Capture Prescaler. This parameter can be a value of [\*TIM\\_Input\\_Capture\\_Prescaler\*](#)
- ***uint32\_t TIM\_HallSensor\_InitTypeDef::IC1Filter***  
Specifies the input capture filter. This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU
- ***uint32\_t TIM\_HallSensor\_InitTypeDef::Commutation\_Delay***  
Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFFU

#### 52.1.2 TIM\_BreakDeadTimeConfigTypeDef

##### Data Fields

- *uint32\_t OffStateRunMode*
- *uint32\_t OffStateIDLEMode*
- *uint32\_t LockLevel*
- *uint32\_t DeadTime*
- *uint32\_t BreakState*
- *uint32\_t BreakPolarity*
- *uint32\_t BreakFilter*
- *uint32\_t Break2State*
- *uint32\_t Break2Polarity*
- *uint32\_t Break2Filter*
- *uint32\_t AutomaticOutput*

##### Field Documentation

- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::OffStateRunMode***  
TIM off state in run mode This parameter can be a value of [\*TIM\\_OSSR\\_Off\\_State\\_Selection\\_for\\_Run\\_mode\\_state\*](#)
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::OffStateIDLEMode***  
TIM off state in IDLE mode This parameter can be a value of [\*TIM\\_OSSI\\_Off\\_State\\_Selection\\_for\\_Idle\\_mode\\_state\*](#)
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::LockLevel***  
TIM Lock level This parameter can be a value of [\*TIM\\_Lock\\_level\*](#)

- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::DeadTime***  
TIM dead Time This parameter can be a number between Min\_Data = 0x00 and Max\_Data = 0xFFU
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::BreakState***  
TIM Break State This parameter can be a value of ***TIM\_Break\_Input\_enable\_disable***
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::BreakPolarity***  
TIM Break input polarity This parameter can be a value of ***TIM\_Break\_Polarity***
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::BreakFilter***  
Specifies the break input filter. This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::Break2State***  
TIM Break2 State This parameter can be a value of ***TIMEx\_Break2\_Input\_enable\_disable***
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::Break2Polarity***  
TIM Break2 input polarity This parameter can be a value of ***TIMEx\_Break2\_Polarity***
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::Break2Filter***  
TIM break2 input filter. This parameter can be a number between Min\_Data = 0x0 and Max\_Data = 0xFU
- ***uint32\_t TIM\_BreakDeadTimeConfigTypeDef::AutomaticOutput***  
TIM Automatic Output Enable state This parameter can be a value of ***TIM\_AOE\_Bit\_Set\_Reset***

### 52.1.3 TIM\_MasterConfigTypeDef

#### Data Fields

- ***uint32\_t MasterOutputTrigger***
- ***uint32\_t MasterOutputTrigger2***
- ***uint32\_t MasterSlaveMode***

#### Field Documentation

- ***uint32\_t TIM\_MasterConfigTypeDef::MasterOutputTrigger***  
Trigger output (TRGO) selection This parameter can be a value of ***TIM\_Master\_Mode\_Selection***
- ***uint32\_t TIM\_MasterConfigTypeDef::MasterOutputTrigger2***  
Trigger output2 (TRGO2) selection This parameter can be a value of ***TIMEx\_Master\_Mode\_Selection\_2***
- ***uint32\_t TIM\_MasterConfigTypeDef::MasterSlaveMode***  
Master/slave mode selection This parameter can be a value of ***TIM\_Master\_Slave\_Mode***

## 52.2 TIMEx Firmware driver API description

### 52.2.1 TIMER Extended features

The Timer Extended features include:

1. Complementary outputs with programmable dead-time for :
  - Output Compare
  - PWM generation (Edge and Center-aligned Mode)
  - One-pulse mode output
2. Synchronization circuit to control the timer with external signals and to interconnect several timers together.
3. Break input to put the timer output signals in reset state or in a known state.
4. Supports incremental (quadrature) encoder and hall-sensor circuitry for positioning purposes

## 52.2.2 How to use this driver

1. Initialize the TIM low level resources by implementing the following functions depending from feature used :
  - Complementary Output Compare : `HAL_TIM_OC_MspInit()`
  - Complementary PWM generation : `HAL_TIM_PWM_MspInit()`
  - Complementary One-pulse mode output : `HAL_TIM_OnePulse_MspInit()`
  - Hall Sensor output : `HAL_TIM_HallSensor_MspInit()`
2. Initialize the TIM low level resources :
  - a. Enable the TIM interface clock using `__HAL_RCC_TIMx_CLK_ENABLE()`;
  - b. TIM pins configuration
    - Enable the clock for the TIM GPIOs using the following function: `__HAL_RCC_GPIOx_CLK_ENABLE()`;
    - Configure these TIM pins in Alternate function mode using `HAL_GPIO_Init()`;
3. The external Clock can be configured, if needed (the default clock is the internal clock from the APBx), using the following function: `HAL_TIM_ConfigClockSource`, the clock configuration should be done before any start function.
4. Configure the TIM in the desired functioning mode using one of the initialization function of this driver:
  - `HAL_TIMEx_HallSensor_Init` and `HAL_TIMEx_ConfigCommutationEvent`: to use the Timer Hall Sensor Interface and the commutation event with the corresponding Interrupt and DMA request if needed (Note that One Timer is used to interface with the Hall sensor Interface and another Timer should be used to use the commutation event).
5. Activate the TIM peripheral using one of the start functions:
  - Complementary Output Compare : `HAL_TIMEx_OCN_Start()`, `HAL_TIMEx_OCN_Start_DMA()`, `HAL_TIMEx_OCN_Start_IT()`
  - Complementary PWM generation : `HAL_TIMEx_PWMN_Start()`, `HAL_TIMEx_PWMN_Start_DMA()`, `HAL_TIMEx_PWMN_Start_IT()`
  - Complementary One-pulse mode output : `HAL_TIMEx_OnePulseN_Start()`, `HAL_TIMEx_OnePulseN_Start_IT()`
  - Hall Sensor output : `HAL_TIMEx_HallSensor_Start()`, `HAL_TIMEx_HallSensor_Start_DMA()`, `HAL_TIMEx_HallSensor_Start_IT()`.

## 52.2.3 Timer Hall Sensor functions

This section provides functions allowing to:

- Initialize and configure TIM HAL Sensor.
- De-initialize TIM HAL Sensor.
- Start the Hall Sensor Interface.
- Stop the Hall Sensor Interface.
- Start the Hall Sensor Interface and enable interrupts.
- Stop the Hall Sensor Interface and disable interrupts.
- Start the Hall Sensor Interface and enable DMA transfers.
- Stop the Hall Sensor Interface and disable DMA transfers.

This section contains the following APIs:

- `HAL\_TIMEx\_HallSensor\_Init\(\)`
- `HAL\_TIMEx\_HallSensor\_DeInit\(\)`
- `HAL\_TIMEx\_HallSensor\_MspInit\(\)`
- `HAL\_TIMEx\_HallSensor\_MspDeInit\(\)`
- `HAL\_TIMEx\_HallSensor\_Start\(\)`
- `HAL\_TIMEx\_HallSensor\_Stop\(\)`
- `HAL\_TIMEx\_HallSensor\_Start\_IT\(\)`

- [\*HAL\\_TIMEx\\_HallSensor\\_Stop\\_IT\(\)\*](#)
- [\*HAL\\_TIMEx\\_HallSensor\\_Start\\_DMA\(\)\*](#)
- [\*HAL\\_TIMEx\\_HallSensor\\_Stop\\_DMA\(\)\*](#)

#### 52.2.4 Timer Complementary Output Compare functions

This section provides functions allowing to:

- Start the Complementary Output Compare.
- Stop the Complementary Output Compare.
- Start the Complementary Output Compare and enable interrupts.
- Stop the Complementary Output Compare and disable interrupts.
- Start the Complementary Output Compare and enable DMA transfers.
- Stop the Complementary Output Compare and disable DMA transfers.

This section contains the following APIs:

- [\*HAL\\_TIMEx\\_OCN\\_Start\(\)\*](#)
- [\*HAL\\_TIMEx\\_OCN\\_Stop\(\)\*](#)
- [\*HAL\\_TIMEx\\_OCN\\_Start\\_IT\(\)\*](#)
- [\*HAL\\_TIMEx\\_OCN\\_Stop\\_IT\(\)\*](#)
- [\*HAL\\_TIMEx\\_OCN\\_Start\\_DMA\(\)\*](#)
- [\*HAL\\_TIMEx\\_OCN\\_Stop\\_DMA\(\)\*](#)

#### 52.2.5 Timer Complementary PWM functions

This section provides functions allowing to:

- Start the Complementary PWM.
- Stop the Complementary PWM.
- Start the Complementary PWM and enable interrupts.
- Stop the Complementary PWM and disable interrupts.
- Start the Complementary PWM and enable DMA transfers.
- Stop the Complementary PWM and disable DMA transfers.
- Start the Complementary Input Capture measurement.
- Stop the Complementary Input Capture.
- Start the Complementary Input Capture and enable interrupts.
- Stop the Complementary Input Capture and disable interrupts.
- Start the Complementary Input Capture and enable DMA transfers.
- Stop the Complementary Input Capture and disable DMA transfers.
- Start the Complementary One Pulse generation.
- Stop the Complementary One Pulse.
- Start the Complementary One Pulse and enable interrupts.
- Stop the Complementary One Pulse and disable interrupts.

This section contains the following APIs:

- [\*HAL\\_TIMEx\\_PWMN\\_Start\(\)\*](#)
- [\*HAL\\_TIMEx\\_PWMN\\_Stop\(\)\*](#)
- [\*HAL\\_TIMEx\\_PWMN\\_Start\\_IT\(\)\*](#)
- [\*HAL\\_TIMEx\\_PWMN\\_Stop\\_IT\(\)\*](#)
- [\*HAL\\_TIMEx\\_PWMN\\_Start\\_DMA\(\)\*](#)
- [\*HAL\\_TIMEx\\_PWMN\\_Stop\\_DMA\(\)\*](#)

### 52.2.6 Timer Complementary One Pulse functions

This section provides functions allowing to:

- Start the Complementary One Pulse generation.
- Stop the Complementary One Pulse.
- Start the Complementary One Pulse and enable interrupts.
- Stop the Complementary One Pulse and disable interrupts.

This section contains the following APIs:

- [`HAL\_TIMEx\_OnePulseN\_Start\(\)`](#)
- [`HAL\_TIMEx\_OnePulseN\_Stop\(\)`](#)
- [`HAL\_TIMEx\_OnePulseN\_Start\_IT\(\)`](#)
- [`HAL\_TIMEx\_OnePulseN\_Stop\_IT\(\)`](#)

### 52.2.7 Peripheral Control functions

This section provides functions allowing to:

- Configure the commutation event in case of use of the Hall sensor interface.
- Configure Output channels for OC and PWM mode.
- Configure Complementary channels, break features and dead time.
- Configure Master synchronization.
- Configure timer remapping capabilities.
- Enable or disable channel grouping

This section contains the following APIs:

- [`HAL\_TIMEx\_ConfigCommuteEvent\(\)`](#)
- [`HAL\_TIMEx\_ConfigCommuteEvent\_IT\(\)`](#)
- [`HAL\_TIMEx\_ConfigCommuteEvent\_DMA\(\)`](#)
- [`HAL\_TIM\_OC\_ConfigChannel\(\)`](#)
- [`HAL\_TIM\_PWM\_ConfigChannel\(\)`](#)
- [`HAL\_TIMEx\_MasterConfigSynchronization\(\)`](#)
- [`HAL\_TIMEx\_ConfigBreakDeadTime\(\)`](#)
- [`HAL\_TIMEx\_RemapConfig\(\)`](#)
- [`HAL\_TIMEx\_GroupChannel5\(\)`](#)

### 52.2.8 Extended Callbacks functions

This section provides Extended TIM callback functions:

- Timer Commutation callback
- Timer Break callback

This section contains the following APIs:

- [`HAL\_TIMEx\_CommulationCallback\(\)`](#)
- [`HAL\_TIMEx\_BreakCallback\(\)`](#)
- [`HAL\_TIMEx\_Break2Callback\(\)`](#)

### 52.2.9 Extended Peripheral State functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- [`HAL\_TIMEx\_HallSensor\_GetState\(\)`](#)

## 52.2.10 Detailed description of functions

### **HAL\_TIMEx\_HallSensor\_Init**

|                      |                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_TIMEx_HallSensor_Init<br/>(TIM_HandleTypeDef * htim, TIM_HallSensor_InitTypeDef * sConfig)</b>                                          |
| Function description | Initializes the TIM Hall Sensor Interface and create the associated handle.                                                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM Encoder Interface handle</li> <li>• <b>sConfig:</b> TIM Hall Sensor configuration structure</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                           |

### **HAL\_TIMEx\_HallSensor\_DelInit**

|                      |                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_TIMEx_HallSensor_DelInit<br/>(TIM_HandleTypeDef * htim)</b>    |
| Function description | DeInitializes the TIM Hall Sensor interface.                                            |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM Hall Sensor handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                  |

### **HAL\_TIMEx\_HallSensor\_MspInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_TIMEx_HallSensor_MspInit (TIM_HandleTypeDef * htim)</b>         |
| Function description | Initializes the TIM Hall Sensor MSP.                                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

### **HAL\_TIMEx\_HallSensor\_MspDelInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_TIMEx_HallSensor_MspDelInit (TIM_HandleTypeDef * htim)</b>      |
| Function description | DeInitializes TIM Hall Sensor MSP.                                          |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

### **HAL\_TIMEx\_HallSensor\_Start**

|                      |                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_TIMEx_HallSensor_Start<br/>(TIM_HandleTypeDef * htim)</b>      |
| Function description | Starts the TIM Hall Sensor Interface.                                                   |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM Hall Sensor handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                  |

**HAL\_TIMEx\_HallSensor\_Stop**

Function name      **HAL\_StatusTypeDef HAL\_TIMEx\_HallSensor\_Stop  
(TIM\_HandleTypeDef \* htim)**

Function description      Stops the TIM Hall sensor Interface.

Parameters      • **htim:** TIM Hall Sensor handle

Return values      • **HAL:** status

**HAL\_TIMEx\_HallSensor\_Start\_IT**

Function name      **HAL\_StatusTypeDef HAL\_TIMEx\_HallSensor\_Start\_IT  
(TIM\_HandleTypeDef \* htim)**

Function description      Starts the TIM Hall Sensor Interface in interrupt mode.

Parameters      • **htim:** TIM Hall Sensor handle

Return values      • **HAL:** status

**HAL\_TIMEx\_HallSensor\_Stop\_IT**

Function name      **HAL\_StatusTypeDef HAL\_TIMEx\_HallSensor\_Stop\_IT  
(TIM\_HandleTypeDef \* htim)**

Function description      Stops the TIM Hall Sensor Interface in interrupt mode.

Parameters      • **htim:** TIM handle

Return values      • **HAL:** status

**HAL\_TIMEx\_HallSensor\_Start\_DMA**

Function name      **HAL\_StatusTypeDef HAL\_TIMEx\_HallSensor\_Start\_DMA  
(TIM\_HandleTypeDef \* htim, uint32\_t \* pData, uint16\_t Length)**

Function description      Starts the TIM Hall Sensor Interface in DMA mode.

Parameters      • **htim:** TIM Hall Sensor handle

• **pData:** The destination Buffer address.

• **Length:** The length of data to be transferred from TIM peripheral to memory.

Return values      • **HAL:** status

**HAL\_TIMEx\_HallSensor\_Stop\_DMA**

Function name      **HAL\_StatusTypeDef HAL\_TIMEx\_HallSensor\_Stop\_DMA  
(TIM\_HandleTypeDef \* htim)**

Function description      Stops the TIM Hall Sensor Interface in DMA mode.

Parameters      • **htim:** TIM handle

Return values      • **HAL:** status

**HAL\_TIMEx\_OCN\_Start**

| <b>Parameters</b>           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM handle</li> <li>• <b>InputTrigger:</b> the Internal trigger corresponding to the Timer Interfacing with the Hall sensor This parameter can be one of the following values: <ul style="list-style-type: none"> <li>- TIM_TS_ITR0: Internal trigger 0 selected</li> <li>- TIM_TS_ITR1: Internal trigger 1 selected</li> <li>- TIM_TS_ITR2: Internal trigger 2 selected</li> <li>- TIM_TS_ITR3: Internal trigger 3 selected</li> <li>- TIM_TS_NONE No trigger is needed</li> </ul> </li> </ul> |

- **CommutationSource:** the Commutation Event source This parameter can be one of the following values:
  - TIM\_COMMUTATION\_TRGI: Commutation source is the TRGI of the Interface Timer
  - TIM\_COMMUTATION\_SOFTWARE: Commutation source is set by software using the COMG bit
- **HAL:** status
- this function is mandatory to use the commutation event in order to update the configuration at each commutation detection on the TRGI input of the Timer, the typical use of this feature is with the use of another Timer(interface Timer) configured in Hall sensor interface, this interface Timer will generate the commutation at its TRGO output (connected to Timer used in this function) each time the TI1 of the Interface Timer detect a commutation at its input TI1.

| Function description | Configures the TIM1, TIM8 and TIM16 Remapping input capabilities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>htim:</b> TIM handle.</li> <li>• <b>Remap1:</b> specifies the first TIM remapping source. This parameter can be one of the following values: <ul style="list-style-type: none"> <li>- TIM_TIM1_ADC1_NONE TIM1_ETR is not connected to any AWD (analog watchdog)</li> <li>- TIM_TIM1_ADC1_AWD1: TIM1_ETR is connected to ADC1 AWD1</li> <li>- TIM_TIM1_ADC1_AWD2: TIM1_ETR is connected to ADC1 AWD2</li> <li>- TIM_TIM1_ADC1_AWD3: TIM1_ETR is connected to ADC1 AWD3</li> <li>- TIM_TIM8_ADC2_NONE TIM8_ETR is not connected to any AWD</li> </ul> </li> </ul> |

- TIM\_TIM8\_ADC2\_AWD1: TIM8\_ETR is connected to ADC2 AWD1
- TIM\_TIM8\_ADC2\_AWD2: TIM8\_ETR is connected to ADC2 AWD2
- TIM\_TIM8\_ADC2\_AWD3: TIM8\_ETR is connected to ADC2 AWD3
- TIM\_TIM16\_GPIO: TIM16 TI1 is connected to GPIO
- TIM\_TIM16\_RTC: TIM16 TI1 is connected to RTC clock
- TIM\_TIM16\_HSE: TIM16 TI1 is connected to HSE/32
- TIM\_TIM16\_MCO: TIM16 TI1 is connected to MCO
- **Remap2:** specifies the second TIMremapping source (if any). This parameter can be one of the following values:
  - TIM\_TIM1\_ADC4\_NONE TIM1\_ETR is not connected to any AWD (analog watchdog)
  - TIM\_TIM1\_ADC4\_AWD1: TIM1\_ETR is connected to ADC4 AWD1
  - TIM\_TIM1\_ADC4\_AWD2: TIM1\_ETR is connected to ADC4 AWD2
  - TIM\_TIM1\_ADC4\_AWD3: TIM1\_ETR is connected to ADC4 AWD3
  - TIM\_TIM8\_ADC3\_NONE TIM8\_ETR is not connected to any AWD
  - TIM\_TIM8\_ADC3\_AWD1: TIM8\_ETR is connected to ADC3 AWD1
  - TIM\_TIM8\_ADC3\_AWD2: TIM8\_ETR is connected to ADC3 AWD2
  - TIM\_TIM8\_ADC3\_AWD3: TIM8\_ETR is connected to ADC3 AWD3

**Return values**

- **HAL:** status

**HAL\_TIMEx\_GroupChannel5****Function name**

**HAL\_StatusTypeDef HAL\_TIMEx\_GroupChannel5  
(TIM\_HandleTypeDef \*htim, uint32\_t Channels)**

**Function description**

Group channel 5 and channel 1, 2 or 3.

**Parameters**

- **htim:** TIM handle.
- **Channels:** specifies the reference signal(s) the OC5REF is combined with. This parameter can be any combination of the following values: TIM\_GROUPCH5\_NONE No effect of OC5REF on OC1REFC, OC2REFC and OC3REFC  
TIM\_GROUPCH5\_OC1REFC: OC1REFC is the logical AND of OC1REFC and OC5REF  
TIM\_GROUPCH5\_OC2REFC: OC2REFC is the logical AND of OC2REFC and OC5REF  
TIM\_GROUPCH5\_OC3REFC: OC3REFC is the logical AND of OC3REFC and OC5REF

**Return values**

- **HAL:** status

**HAL\_TIMEx\_CommmutationCallback**

### 52.3.1 TIMEx

***TIMEX Break input 2 Enable***

TIM\_BREAK2\_DISABLE

TIM\_BREAK2\_ENABLE

***TIMEx Break Input 2 Polarity***

TIM\_BREAK2POLARITY\_LOW  
TIM\_BREAK2POLARITY\_HIGH

***TIMEx Channel***

TIM\_CHANNEL\_1  
TIM\_CHANNEL\_2  
TIM\_CHANNEL\_3  
TIM\_CHANNEL\_4  
TIM\_CHANNEL\_5  
TIM\_CHANNEL\_6  
TIM\_CHANNEL\_ALL

***TIMEx Clear Input Source***

TIM\_CLEARINPUTSOURCE\_ETR  
TIM\_CLEARINPUTSOURCE\_OCREFCLR  
TIM\_CLEARINPUTSOURCE\_NONE

***TIMEx Exported Macros***

\_HAL\_TIM\_SET\_COMPARE

**Description:**

- Sets the TIM Capture Compare Register value on runtime without calling another time ConfigChannel function.

**Parameters:**

- \_HANDLE\_: TIM handle.
- \_CHANNEL\_: TIM Channels to be configured. This parameter can be one of the following values:
  - TIM\_CHANNEL\_1: TIM Channel 1 selected
  - TIM\_CHANNEL\_2: TIM Channel 2 selected
  - TIM\_CHANNEL\_3: TIM Channel 3 selected
  - TIM\_CHANNEL\_4: TIM Channel 4 selected
  - TIM\_CHANNEL\_5: TIM Channel 5 selected
  - TIM\_CHANNEL\_6: TIM Channel 6 selected
- \_COMPARE\_: specifies the Capture Compare register new value.

**Return value:**

- None

\_HAL\_TIM\_GET\_COMPARE

**Description:**

- Gets the TIM Capture Compare Register

value on runtime.

**Parameters:**

- `__HANDLE__`: TIM handle.
- `__CHANNEL__`: TIM Channel associated with the capture compare register This parameter can be one of the following values:
  - `TIM_CHANNEL_1`: get capture/compare 1 register value
  - `TIM_CHANNEL_2`: get capture/compare 2 register value
  - `TIM_CHANNEL_3`: get capture/compare 3 register value
  - `TIM_CHANNEL_4`: get capture/compare 4 register value
  - `TIM_CHANNEL_5`: get capture/compare 5 register value
  - `TIM_CHANNEL_6`: get capture/compare 6 register value

**Return value:**

- None

`__HAL_TIM_ENABLE_OCxPRELOAD`

- Sets the TIM Output compare preload.

**Parameters:**

- `__HANDLE__`: TIM handle.
- `__CHANNEL__`: TIM Channels to be configured. This parameter can be one of the following values:
  - `TIM_CHANNEL_1`: TIM Channel 1 selected
  - `TIM_CHANNEL_2`: TIM Channel 2 selected
  - `TIM_CHANNEL_3`: TIM Channel 3 selected
  - `TIM_CHANNEL_4`: TIM Channel 4 selected
  - `TIM_CHANNEL_5`: TIM Channel 5 selected
  - `TIM_CHANNEL_6`: TIM Channel 6 selected

**Return value:**

- None

`__HAL_TIM_DISABLE_OCxPRELOAD`

- Resets the TIM Output compare preload.

**Parameters:**

- `__HANDLE__`: TIM handle.
- `__CHANNEL__`: TIM Channels to be

configured. This parameter can be one of the following values:

- TIM\_CHANNEL\_1: TIM Channel 1 selected
- TIM\_CHANNEL\_2: TIM Channel 2 selected
- TIM\_CHANNEL\_3: TIM Channel 3 selected
- TIM\_CHANNEL\_4: TIM Channel 4 selected
- TIM\_CHANNEL\_5: TIM Channel 5 selected
- TIM\_CHANNEL\_6: TIM Channel 6 selected

#### Return value:

- None

#### **Group Channel 5 and Channel 1U, 2 or 3**

|                      |                                                     |
|----------------------|-----------------------------------------------------|
| TIM_GROUPCH5_NONE    | No effect of OC5REF on OC1REFC, OC2REFC and OC3REFC |
| TIM_GROUPCH5_OC1REFC | OC1REFC is the logical AND of OC1REFC and OC5REF    |
| TIM_GROUPCH5_OC2REFC | OC2REFC is the logical AND of OC2REFC and OC5REF    |
| TIM_GROUPCH5_OC3REFC | OC3REFC is the logical AND of OC3REFC and OC5REF    |

#### **TIMEx Master Mode Selection 2 (TRGO2)**

|                                        |
|----------------------------------------|
| TIM_TRGO2_RESET                        |
| TIM_TRGO2_ENABLE                       |
| TIM_TRGO2_UPDATE                       |
| TIM_TRGO2_OC1                          |
| TIM_TRGO2_OC1REF                       |
| TIM_TRGO2_OC2REF                       |
| TIM_TRGO2_OC3REF                       |
| TIM_TRGO2_OC4REF                       |
| TIM_TRGO2_OC5REF                       |
| TIM_TRGO2_OC6REF                       |
| TIM_TRGO2_OC4REF_RISINGFALLING         |
| TIM_TRGO2_OC6REF_RISINGFALLING         |
| TIM_TRGO2_OC4REF_RISING_OC6REF_RISING  |

## 53 HAL TSC Generic Driver

### 53.1 TSC Firmware driver registers structures

#### 53.1.1 TSC\_InitTypeDef

##### Data Fields

- *uint32\_t CTPulseHighLength*
- *uint32\_t CTPulseLowLength*
- *uint32\_t SpreadSpectrum*
- *uint32\_t SpreadSpectrumDeviation*
- *uint32\_t SpreadSpectrumPrescaler*
- *uint32\_t PulseGeneratorPrescaler*
- *uint32\_t MaxCountValue*
- *uint32\_t IODefaultMode*
- *uint32\_t SynchroPinPolarity*
- *uint32\_t AcquisitionMode*
- *uint32\_t MaxCountInterrupt*
- *uint32\_t ChannelIOs*
- *uint32\_t ShieldIOs*
- *uint32\_t SamplingIOs*

##### Field Documentation

- ***uint32\_t TSC\_InitTypeDef::CTPulseHighLength***  
Charge-transfer high pulse length This parameter can be a value of  
***TSC\_CTPulseHL\_Config***
- ***uint32\_t TSC\_InitTypeDef::CTPulseLowLength***  
Charge-transfer low pulse length This parameter can be a value of  
***TSC\_CTPulseLL\_Config***
- ***uint32\_t TSC\_InitTypeDef::SpreadSpectrum***  
Spread spectrum activation This parameter can be a value of  
***TSC\_CTPulseLL\_Config***
- ***uint32\_t TSC\_InitTypeDef::SpreadSpectrumDeviation***  
Spread spectrum deviation This parameter must be a number between Min\_Data = 0 and Max\_Data = 127U
- ***uint32\_t TSC\_InitTypeDef::SpreadSpectrumPrescaler***  
Spread spectrum prescaler This parameter can be a value of  
***TSC\_SpreadSpec\_Prescaler***
- ***uint32\_t TSC\_InitTypeDef::PulseGeneratorPrescaler***  
Pulse generator prescaler This parameter can be a value of  
***TSC\_PulseGenerator\_Prescaler***
- ***uint32\_t TSC\_InitTypeDef::MaxCountValue***  
Max count value This parameter can be a value of ***TSC\_MaxCount\_Value***
- ***uint32\_t TSC\_InitTypeDef::IODefaultMode***  
IO default mode This parameter can be a value of ***TSC\_IO\_Default\_Mode***
- ***uint32\_t TSC\_InitTypeDef::SynchroPinPolarity***  
Synchro pin polarity This parameter can be a value of ***TSC\_Synchro\_Pin\_Polarity***
- ***uint32\_t TSC\_InitTypeDef::AcquisitionMode***  
Acquisition mode This parameter can be a value of ***TSC\_Acquisition\_Mode***
- ***uint32\_t TSC\_InitTypeDef::MaxCountInterrupt***  
Max count interrupt activation This parameter can be set to ENABLE or DISABLE.

- *uint32\_t TSC\_InitTypeDef::ChannelIOs*  
Channel IOs mask
- *uint32\_t TSC\_InitTypeDef::ShieldIOs*  
Shield IOs mask
- *uint32\_t TSC\_InitTypeDef::SamplingIOs*  
Sampling IOs mask

## 53.2 TSC Firmware driver API description

### 53.2.1 TSC specific features

1. Proven and robust surface charge transfer acquisition principle
2. Supports up to 3 capacitive sensing channels per group
3. Capacitive sensing channels can be acquired in parallel offering a very good response time
4. Spread spectrum feature to improve system robustness in noisy environments
5. Full hardware management of the charge transfer acquisition sequence
6. Programmable charge transfer frequency
7. Programmable sampling capacitor I/O pin
8. Programmable channel I/O pin
9. Programmable max count value to avoid long acquisition when a channel is faulty

10. Dedicated end of acquisition and max count error flags with interrupt capability
11. One sampling capacitor for up to 3 capacitive sensing channels to reduce the system components
12. Compatible with proximity, touchkey, linear and rotary touch sensor implementation

### 53.2.2 How to use this driver

1. Enable the TSC interface clock using `__HAL_RCC_TSC_CLK_ENABLE()` macro.
2. GPIO pins configuration
  - Enable the clock for the TSC GPIOs using `__HAL_RCC_GPIOx_CLK_ENABLE()` macro.
  - Configure the TSC pins used as sampling IOs in alternate function output Open-Drain mode, and TSC pins used as channel/shield IOs in alternate function output Push-Pull mode using `HAL_GPIO_Init()` function.
3. Interrupts configuration
  - Configure the NVIC (if the interrupt model is used) using `HAL_NVIC_SetPriority()` and `HAL_NVIC_EnableIRQ()` function.
4. TSC configuration
  - Configure all TSC parameters and used TSC IOs using `HAL_TSC_Init()` function.

#### Acquisition sequence

- Discharge all IOs using `HAL_TSC_IODischarge()` function.
- Wait a certain time allowing a good discharge of all capacitors. This delay depends of the sampling capacitor and electrodes design.
- Select the channel IOs to be acquired using `HAL_TSC_IOConfig()` function.
- Launch the acquisition using either `HAL_TSC_Start()` or `HAL_TSC_Start_IT()` function. If the synchronized mode is selected, the acquisition will start as soon as the signal is received on the synchro pin.
- Wait the end of acquisition using either `HAL_TSC_PollForAcquisition()` or `HAL_TSC_GetState()` function or using WFI instruction for example.
- Check the group acquisition status using `HAL_TSC_GroupGetStatus()` function.
- Read the acquisition value using `HAL_TSC_GroupGetValue()` function.

### 53.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the TSC.
- De-initialize the TSC.

This section contains the following APIs:

- [`HAL\_TSC\_Init\(\)`](#)
- [`HAL\_TSC\_DelInit\(\)`](#)
- [`HAL\_TSC\_MspInit\(\)`](#)
- [`HAL\_TSC\_MspDelInit\(\)`](#)

### 53.2.4 IO Operation functions

This section provides functions allowing to:

- Start acquisition in polling mode.
- Start acquisition in interrupt mode.
- Stop conversion in polling mode.
- Stop conversion in interrupt mode.
- Poll for acquisition completed.
- Get group acquisition status.

- Get group acquisition value.

This section contains the following APIs:

- [\*HAL\\_TSC\\_Start\(\)\*](#)
- [\*HAL\\_TSC\\_Start\\_IT\(\)\*](#)
- [\*HAL\\_TSC\\_Stop\(\)\*](#)
- [\*HAL\\_TSC\\_Stop\\_IT\(\)\*](#)
- [\*HAL\\_TSC\\_PollForAcquisition\(\)\*](#)
- [\*HAL\\_TSC\\_GroupGetStatus\(\)\*](#)
- [\*HAL\\_TSC\\_GroupGetValue\(\)\*](#)

### 53.2.5 Peripheral Control functions

This section provides functions allowing to:

- Configure TSC IOs
- Discharge TSC IOs

This section contains the following APIs:

- [\*HAL\\_TSC\\_IOConfig\(\)\*](#)
- [\*HAL\\_TSC\\_IODischarge\(\)\*](#)

### 53.2.6 State and Errors functions

This subsection provides functions allowing to

- Get TSC state.

This section contains the following APIs:

- [\*HAL\\_TSC\\_GetState\(\)\*](#)

### 53.2.7 Detailed description of functions

#### HAL\_TSC\_Init

|                      |                                                                                                                                            |

**TSC Exported Macros**

`__HAL_TSC_RESET_HANDLE_STATE`

**Description:**

- Reset TSC handle state.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_ENABLE`

**Description:**

- Enable the TSC peripheral.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_DISABLE`

**Description:**

- Disable the TSC peripheral.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_START_ACQ`

**Description:**

- Start acquisition.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_STOP_ACQ`**Description:**

- Stop acquisition.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_SET_IODEF_OUTPPLOW`**Description:**

- Set IO default mode to output push-pull low.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_SET_IODEF_INFLOAT`**Description:**

- Set IO default mode to input floating.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_SET_SYNC_POL_FALL`**Description:**

- Set synchronization polarity to falling edge.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_SET_SYNC_POL_RISE_HIGH`**Description:**

- Set synchronization polarity to rising edge and high level.

**Parameters:**

- `__HANDLE__`: TSC handle

**Return value:**

- None

`__HAL_TSC_ENABLE_IT`**Description:**

- Enable TSC interrupt.

**Parameters:**

- `__HANDLE__`: TSC handle

- `_INTERRUPT_`: TSC interrupt

**Description:**

- Disable TSC interrupt.

**Parameters:**

- `_HANDLE_`: TSC handle
- `_INTERRUPT_`: TSC interrupt

**Description:**

- Check whether the specified TSC interrupt source is enabled or not.

**Parameters:**

- `_HANDLE_`: TSC Handle
- `_INTERRUPT_`: TSC interrupt

**Description:**

- SET: or RESET

**Parameters:**

- `_HANDLE_`: TSC handle
- `_FLAG_`: TSC flag

**Description:**

- SET: or RESET

**Parameters:**

- `_HANDLE_`: TSC handle
- `_FLAG_`: TSC flag

**Description:**

- Clear the TSC's pending flag.

**Parameters:**

- `_HANDLE_`: TSC handle
- `_FLAG_`: TSC flag

**Description:**

- Enable schmitt trigger hysteresis on a group of IOs.

**Parameters:**

- `_HANDLE_`: TSC handle

- `__GX_IOY_MASK__`: IOs mask

**Description:**

- Disable schmitt trigger hysteresis on a group of IOs.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_IOY_MASK__`: IOs mask

**Return value:**

- None

**Description:**

- Open analog switch on a group of IOs.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_IOY_MASK__`: IOs mask

**Return value:**

- None

**Description:**

- Close analog switch on a group of IOs.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_IOY_MASK__`: IOs mask

**Return value:**

- None

**Description:**

- Enable a group of IOs in channel mode.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_IOY_MASK__`: IOs mask

**Return value:**

- None

**Description:**

- Disable a group of channel IOs.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_IOY_MASK__`: IOs mask

**Return value:**

- None

`__HAL_TSC_ENABLE_SAMPLING`

**Description:**

- Enable a group of IOs in sampling mode.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_IOY_MASK__`: IOs mask

**Return value:**

- None

`__HAL_TSC_DISABLE_SAMPLING`

**Description:**

- Disable a group of sampling IOs.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_IOY_MASK__`: IOs mask

**Return value:**

- None

`__HAL_TSC_ENABLE_GROUP`

**Description:**

- Enable acquisition groups.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_MASK__`: Groups mask

**Return value:**

- None

`__HAL_TSC_DISABLE_GROUP`

**Description:**

- Disable acquisition groups.

**Parameters:**

- `__HANDLE__`: TSC handle
- `__GX_MASK__`: Groups mask

**Return value:**

- None

`__HAL_TSC_GET_GROUP_STATUS`

**Description:**

- Gets acquisition group status.

**Parameters:**

- `__HANDLE__`: TSC Handle
- `__GX_INDEX__`: Group index

**Return value:**

- SET: or RESET

## 54 HAL UART Generic Driver

### 54.1 UART Firmware driver registers structures

#### 54.1.1 **UART\_InitTypeDef**

##### Data Fields

- *uint32\_t BaudRate*
- *uint32\_t WordLength*
- *uint32\_t StopBits*
- *uint32\_t Parity*
- *uint32\_t Mode*
- *uint32\_t HwFlowCtl*
- *uint32\_t OverSampling*
- *uint32\_t OneBitSampling*

UART, pour Universal Asynchronous Receiver Transmitter,

##### Field Documentation

- ***uint32\_t UART\_InitTypeDef::BaudRate***

This member configures the UART communication baud rate. The baud rate register is computed using the following formula:  
If oversampling is 16 or in LIN mode, Baud Rate Register = ((PCLKx) / ((huart->Init.BaudRate)))  
If oversampling is 8U, Baud Rate Register[15:4] = ((2U \* PCLKx) / ((huart->Init.BaudRate)))[15:4] Baud Rate Register[3] = 0  
Baud Rate Register[2:0] = (((2U \* PCLKx) / ((huart->Init.BaudRate)))[3:0]) >> 1

- ***uint32\_t UART\_InitTypeDef::WordLength***

Specifies the number of data bits transmitted or received in a frame. This parameter can be a value of [\*\*UARTEx\\_Word\\_Length\*\*](#).

- ***uint32\_t UART\_InitTypeDef::StopBits***

Specifies the number of stop bits transmitted. This parameter can be a value of [\*\*UART\\_Stop\\_Bits\*\*](#).

- ***uint32\_t UART\_InitTypeDef::Parity***

Specifies the parity mode. This parameter can be a value of [\*\*UART\\_Parity\*\*](#)  
**Note:**When parity is enabled, the computed parity is inserted at the MSB position of the transmitted data (9th bit when the word length is set to 9 data bits; 8th bit when the word length is set to 8 data bits).

- ***uint32\_t UART\_InitTypeDef::Mode***

Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of [\*\*UART\\_Mode\*\*](#).

- ***uint32\_t UART\_InitTypeDef::HwFlowCtl***

Specifies whether the hardware flow control mode is enabled or disabled. This parameter can be a value of [\*\*UART\\_Hardware\\_Flow\\_Control\*\*](#).

- ***uint32\_t UART\_InitTypeDef::OverSampling***

Specifies whether the Over sampling 8 is enabled or disabled, to achieve higher speed (up to f\_PCLK/8U). This parameter can be a value of [\*\*UART\\_Over\\_Sampling\*\*](#).

- ***uint32\_t UART\_InitTypeDef::OneBitSampling***

Specifies whether a single sample or three samples' majority vote is selected. Selecting the single sample method increases the receiver tolerance to clock deviations. This parameter can be a value of [\*\*UART\\_OneBit\\_Sampling\*\*](#).

#### 54.1.2 **UART\_AdvFeatureInitTypeDef**

##### Data Fields

- `uint32_t AdvFeatureInit`
- `uint32_t TxPinLevInvert`
- `uint32_t RxPinLevInvert`
- `uint32_t DataInvert`
- `uint32_t Swap`
- `uint32_t OverrunDisable`
- `uint32_t DMADisableonRxError`
- `uint32_t AutoBaudRateEnable`
- `uint32_t AutoBaudRateMode`
- `uint32_t MSBFirst`

#### Field Documentation

- **`uint32_t UART_AdvFeatureInitTypeDef::AdvFeatureInit`**  
Specifies which advanced UART features is initialized. Several Advanced Features may be initialized at the same time . This parameter can be a value of [`UART\_Advanced\_Features\_Initialization\_Type`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::TxPinLevInvert`**  
Specifies whether the TX pin active level is inverted. This parameter can be a value of [`UART\_Tx\_Inv`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::RxPinLevInvert`**  
Specifies whether the RX pin active level is inverted. This parameter can be a value of [`UART\_Rx\_Inv`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::DataInvert`**  
Specifies whether data are inverted (positive/direct logic vs negative/inverted logic). This parameter can be a value of [`UART\_Data\_Inv`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::Swap`**  
Specifies whether TX and RX pins are swapped. This parameter can be a value of [`UART\_Rx\_Tx\_Swap`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::OverrunDisable`**  
Specifies whether the reception overrun detection is disabled. This parameter can be a value of [`UART\_Overrun\_Disable`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::DMADisableonRxError`**  
Specifies whether the DMA is disabled in case of reception error. This parameter can be a value of [`UART\_DMA\_Disable\_on\_Rx\_Error`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::AutoBaudRateEnable`**  
Specifies whether auto Baud rate detection is enabled. This parameter can be a value of [`UART\_AutoBaudRate\_Enable`](#)
- **`uint32_t UART_AdvFeatureInitTypeDef::AutoBaudRateMode`**  
If auto Baud rate detection is enabled, specifies how the rate detection is carried out. This parameter can be a value of [`UART\_AutoBaud\_Rate\_Mode`](#).
- **`uint32_t UART_AdvFeatureInitTypeDef::MSBFirst`**  
Specifies whether MSB is sent first on UART line. This parameter can be a value of [`UART\_MSB\_First`](#).

### 54.1.3 `UART_WakeUpTypeDef`

#### Data Fields

- `uint32_t WakeUpEvent`
- `uint16_t AddressLength`
- `uint8_t Address`

#### Field Documentation

- **`uint32_t UART_WakeUpTypeDef::WakeUpEvent`**  
Specifies which event will activat the Wakeup from Stop mode flag (WUF). This

- parameter can be a value of [\*\*UART\\_WakeUp\\_from\\_Stop\\_Selection\*\*](#). If set to **UART\_WAKEUP\_ON\_ADDRESS**, the two other fields below must be filled up.
- ***uint16\_t* **UART\_WakeUpTypeDef::AddressLength****  
Specifies whether the address is 4 or 7-bit long. This parameter can be a value of [\*\*UART\\_WakeUp\\_Address\\_Length\*\*](#).
  - ***uint8\_t* **UART\_WakeUpTypeDef::Address****  
UART/USART node address (7-bit long max).

#### 54.1.4 **UART\_HandleTypeDef**

##### Data Fields

- ***USART\_TypeDef \** Instance**
- ***UART\_InitTypeDef Init***
- ***UART\_AdvFeatureInitTypeDef AdvancedInit***
- ***uint8\_t \* pTxBuffPtr***

- **`HAL_LockTypeDef` `UART_HandleTypeDef::Lock`**  
Locking object
- **`_IO HAL_UART_StateTypeDef` `UART_HandleTypeDef::gState`**  
UART state information related to global Handle management and also related to Tx operations. This parameter can be a value of `HAL_UART_StateTypeDef`
- **`_IO HAL_UART_StateTypeDef` `UART_HandleTypeDef::RxState`**  
UART state information related to Rx operations. This parameter can be a value of `HAL_UART_StateTypeDef`
- **`_IO uint32_t` `UART_HandleTypeDef::ErrorCode`**  
UART Error code

## 54.2 UART Firmware driver API description

### 54.2.1 How to use this driver

The UART HAL driver can be used as follows:

1. Declare a `UART_HandleTypeDef` handle structure (eg. `UART_HandleTypeDef huart`).
2. Initialize the UART low level resources by implementing the `HAL_UART_MspInit()` API:
  - Enable the USARTx interface clock.
  - UART pins configuration:
    - Enable the clock for the UART GPIOs.
    - Configure these UART pins as alternate function pull-up.
  - NVIC configuration if you need to use interrupt process (`HAL_UART_Transmit_IT()` and `HAL_UART_Receive_IT()` APIs):
    - Configure the USARTx interrupt priority.
    - Enable the NVIC USART IRQ handle.
  - UART interrupts handling: The specific UART interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) are managed using the macros `__HAL_UART_ENABLE_IT()` and `__HAL_UART_DISABLE_IT()` inside the transmit and receive processes.
  - DMA Configuration if you need to use DMA process (`HAL_UART_Transmit_DMA()` and `HAL_UART_Receive_DMA()` APIs):
    - Declare a DMA handle structure for the Tx/Rx channel.
    - Enable the DMAx interface clock.
    - Configure the declared DMA handle structure with the required Tx/Rx parameters.
    - Configure the DMA Tx/Rx channel.
    - Associate the initialized DMA handle to the UART DMA Tx/Rx handle.
    - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
3. Program the Baud Rate, Word Length, Stop Bit, Parity, Hardware flow control and Mode (Receiver/Transmitter) in the `huart` handle Init structure.
4. If required, program UART advanced features (TX/RX pins swap, auto Baud rate detection,...) in the `huart` handle AdvancedInit structure.
5. For the UART asynchronous mode, initialize the UART registers by calling the `HAL_UART_Init()` API.
6. For the UART Half duplex mode, initialize the UART registers by calling the `HAL_HalfDuplex_Init()` API.
7. For the UART LIN (Local Interconnection Network) mode, initialize the UART registers by calling the `HAL_LIN_Init()` API.
8. For the UART Multiprocessor mode, initialize the UART registers by calling the `HAL_MultiProcessor_Init()` API.

9. For the UART RS485 Driver Enabled mode, initialize the UART registers by calling the HAL\_RS485Ex\_Init() API.

These APIs (HAL\_UART\_Init(), HAL\_HalfDuplex\_Init(), HAL\_MultiProcessor\_Init()), also configure the low level Hardware (GPIO, CLOCK, CORTEX...etc) by calling the customized HAL\_UART\_MspInit() API.

Three operation modes are available within this driver :

### Polling mode IO operation

- Send an amount of data in blocking mode using HAL\_UART\_Transmit()
- Receive an amount of data in blocking mode using HAL\_UART\_Receive()

### Interrupt mode IO operation

- Send an amount of data in non blocking mode using HAL\_UART\_Transmit\_IT()
- At transmission end of half transfer HAL\_UART\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_TxHalfCpltCallback
- At transmission end of transfer HAL\_UART\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_TxCpltCallback
- Receive an amount of data in non blocking mode using HAL\_UART\_Receive\_IT()
- At reception end of half transfer HAL\_UART\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_RxHalfCpltCallback
- At reception end of transfer HAL\_UART\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_RxCpltCallback
- In case of transfer Error, HAL\_UART\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_UART\_ErrorCallback

### DMA mode IO operation

- Send an amount of data in non blocking mode (DMA) using HAL\_UART\_Transmit\_DMA()
- At transmission end of half transfer HAL\_UART\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_TxHalfCpltCallback
- At transmission end of transfer HAL\_UART\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_TxCpltCallback
- Receive an amount of data in non blocking mode (DMA) using HAL\_UART\_Receive\_DMA()
- At reception end of half transfer HAL\_UART\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_RxHalfCpltCallback
- At reception end of transfer HAL\_UART\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_UART\_RxCpltCallback
- In case of transfer Error, HAL\_UART\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_UART\_ErrorCallback
- Pause the DMA Transfer using HAL\_UART\_DMAPause()
- Resume the DMA Transfer using HAL\_UART\_DMAResume()
- Stop the DMA Transfer using HAL\_UART\_DMAStop()

### UART HAL driver macros list

Below the list of most used macros in UART HAL driver.

- `_HAL_UART_ENABLE`: Enable the UART peripheral
- `_HAL_UART_DISABLE`: Disable the UART peripheral
- `_HAL_UART_GET_FLAG` : Check whether the specified UART flag is set or not
- `_HAL_UART_CLEAR_FLAG` : Clear the specified UART pending flag
- `_HAL_UART_ENABLE_IT`: Enable the specified UART interrupt
- `_HAL_UART_DISABLE_IT`: Disable the specified UART interrupt

You can refer to the UART HAL driver header file for more useful macros

### 54.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USARTx or the UARTy in asynchronous mode.

- For the asynchronous mode the parameters below can be configured:
  - Baud Rate
  - Word Length
  - Stop Bit
  - Parity
  - Hardware flow control
  - Receiver/transmitter modes
  - Over Sampling Method
  - One-Bit Sampling Method
- For the asynchronous mode, the following advanced features can be configured as well:
  - TX and/or RX pin level inversion
  - data logical level inversion
  - RX and TX pins swap
  - RX overrun detection disabling
  - DMA disabling on RX error
  - MSB first on communication line
  - auto Baud rate detection

The `HAL_UART_Init()`, `HAL_HalfDuplex_Init()`, `HAL_LIN_Init()` and `HAL_MultiProcessor_Init()` API follow respectively the UART asynchronous, UART Half duplex, UART LIN mode and multiprocessor configuration procedures (details for the procedures are available in reference manual).

This section contains the following APIs:

- [`HAL\_UART\_Init\(\)`](#)
- [`HAL\_HalfDuplex\_Init\(\)`](#)
- [`HAL\_LIN\_Init\(\)`](#)
- [`HAL\_MultiProcessor\_Init\(\)`](#)
- [`HAL\_UART\_DeInit\(\)`](#)
- [`HAL\_UART\_MspInit\(\)`](#)
- [`HAL\_UART\_MspDeInit\(\)`](#)

### 54.2.3 IO operation functions

This section contains the following APIs:

- [\*HAL\\_UART\\_Transmit\(\)\*](#)
- [\*HAL\\_UART\\_Receive\(\)\*](#)
- [\*HAL\\_UART\\_Transmit\\_IT\(\)\*](#)
- [\*HAL\\_UART\\_Receive\\_IT\(\)\*](#)
- [\*HAL\\_UART\\_Transmit\\_DMA\(\)\*](#)
- [\*HAL\\_UART\\_Receive\\_DMA\(\)\*](#)
- [\*HAL\\_UART\\_DMAPause\(\)\*](#)
- [\*HAL\\_UART\\_DMAResume\(\)\*](#)
- [\*HAL\\_UART\\_DMAStop\(\)\*](#)
- [\*HAL\\_UART\\_Abort\(\)\*](#)
- [\*HAL\\_UART\\_AbortTransmit\(\)\*](#)
- [\*HAL\\_UART\\_AbortReceive\(\)\*](#)
- [\*HAL\\_UART\\_Abort\\_IT\(\)\*](#)
- [\*HAL\\_UART\\_AbortTransmit\\_IT\(\)\*](#)
- [\*HAL\\_UART\\_AbortReceive\\_IT\(\)\*](#)
- [\*HAL\\_UART\\_IRQHandler\(\)\*](#)
- [\*HAL\\_UART\\_TxCpltCallback\(\)\*](#)
- [\*HAL\\_UART\\_TxHalfCpltCallback\(\)\*](#)
- [\*HAL\\_UART\\_RxCpltCallback\(\)\*](#)
- [\*HAL\\_UART\\_RxHalfCpltCallback\(\)\*](#)
- [\*HAL\\_UART\\_ErrorCallback\(\)\*](#)
- [\*HAL\\_UART\\_AbortCpltCallback\(\)\*](#)
- [\*HAL\\_UART\\_AbortTransmitCpltCallback\(\)\*](#)
- [\*HAL\\_UART\\_AbortReceiveCpltCallback\(\)\*](#)

### 54.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the UART.

- [\*HAL\\_MultiProcessor\\_EnableMuteMode\(\)\*](#) API enables mute mode
- [\*HAL\\_MultiProcessor\\_DisableMuteMode\(\)\*](#) API disables mute mode
- [\*HAL\\_MultiProcessor\\_EnterMuteMode\(\)\*](#) API enters mute mode
- [\*HAL\\_HalfDuplex\\_EnableTransmitter\(\)\*](#) API disables receiver and enables transmitter
- [\*HAL\\_HalfDuplex\\_EnableReceiver\(\)\*](#) API disables transmitter and enables receiver
- [\*HAL\\_LIN\\_SendBreak\(\)\*](#) API transmits the break characters

This section contains the following APIs:

- [\*HAL\\_MultiProcessor\\_EnableMuteMode\(\)\*](#)
- [\*HAL\\_MultiProcessor\\_DisableMuteMode\(\)\*](#)
- [\*HAL\\_MultiProcessor\\_EnterMuteMode\(\)\*](#)
- [\*HAL\\_HalfDuplex\\_EnableTransmitter\(\)\*](#)
- [\*HAL\\_HalfDuplex\\_EnableReceiver\(\)\*](#)
- [\*HAL\\_LIN\\_SendBreak\(\)\*](#)

### 54.2.5 Peripheral State and Error functions

This subsection provides functions allowing to :

- Return the UART handle state.
- Return the UART handle error code

This section contains the following APIs:

- [\*\*HAL\\_UART\\_GetState\(\)\*\*](#)
- [\*\*HAL\\_UART\\_GetError\(\)\*\*](#)

#### 54.2.6 Detailed description of functions

##### **HAL\_UART\_Init**

|                      |                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_UART_Init (UART_HandleTypeDef * huart)</b>                                                          |
| Function description | Initialize the UART mode according to the specified parameters in the UART_InitTypeDef and initialize the associated handle. |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> </ul>                                               |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                       |

##### **HAL\_HalfDuplex\_Init**

|                      |                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HalfDuplex_Init (UART_HandleTypeDef * huart)</b>                                                        |
| Function description | Initialize the half-duplex mode according to the specified parameters in the UART_InitTypeDef and creates the associated handle. |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> </ul>                                                   |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                           |

##### **HAL\_LIN\_Init**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_LIN_Init (UART_HandleTypeDef * huart, uint32_t BreakDetectLength)</b>                                                                                                                                                                                                                                                                                                           |
| Function description | Initialize the LIN mode according to the specified parameters in the UART_InitTypeDef and creates the associated handle .                                                                                                                                                                                                                                                                                |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> <li>• <b>BreakDetectLength:</b> specifies the LIN break detection length. This parameter can be one of the following values: <ul style="list-style-type: none"> <li>– <b>UART_LINBREAKDETECTLENGTH_10B</b> 10-bit break detection</li> <li>– <b>UART_LINBREAKDETECTLENGTH_11B</b> 11-bit break detection</li> </ul> </li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                                   |

##### **HAL\_MultiProcessor\_Init**

|                      |                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_MultiProcessor_Init (UART_HandleTypeDef * huart, uint8_t Address, uint32_t WakeUpMethod)</b>                  |
| Function description | Initialize the multiprocessor mode according to the specified parameters in the UART_InitTypeDef and initialize the associated handle. |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameters    | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> <li><b>Address:</b> UART node address (4-, 6-, 7- or 8-bit long).</li> <li><b>WakeUpMethod:</b> specifies the UART wakeup method. This parameter can be one of the following values:           <ul style="list-style-type: none"> <li>– <b>UART_WAKEUPMETHOD_IDLELINE</b> WakeUp by an idle line detection</li> <li>– <b>UART_WAKEUPMETHOD_ADDRESSMARK</b> WakeUp by an address mark</li> </ul> </li> </ul>                        |
| Return values | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Notes         | <ul style="list-style-type: none"> <li>If the user resorts to idle line detection wake up, the Address parameter is useless and ignored by the initialization function.</li> <li>If the user resorts to address mark wake up, the address length detection is configured by default to 4 bits only. For the UART to be able to manage 6-, 7- or 8-bit long addresses detection, the API <b>HAL_MultiProcessorEx_AddressLength_Set()</b> must be called after <b>HAL_MultiProcessor_Init()</b>.</li> </ul> |

### HAL\_UART\_DeInit

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_UART_DeInit (UART_HandleTypeDef * huart)</b>        |
| Function description | DeInitialize the UART peripheral.                                            |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>         |

### HAL\_UART\_MspInit

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>void HAL_UART_MspInit (UART_HandleTypeDef * huart)</b>                    |
| Function description | Initialize the UART MSP.                                                     |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                |

### HAL\_UART\_MspDeInit

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>void HAL_UART_MspDeInit (UART_HandleTypeDef * huart)</b>                  |
| Function description | DeInitialize the UART MSP.                                                   |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                |

### HAL\_UART\_Transmit

|                      |                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_UART_Transmit (UART_HandleTypeDef * huart, uint8_t * pData, uint16_t Size, uint32_t Timeout)</b> |
| Function description | Send an amount of data in blocking mode.                                                                                  |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul>                                              |

- **pData:** Pointer to data buffer.
- **Size:** Amount of data to be sent.
- **Timeout:** Timeout duration.
- **HAL:** status

Return values

**HAL\_UART\_Receive**

|                      |                                                                                                                                                                                                                                     |

| Notes                | <ul style="list-style-type: none"> <li>• This procedure could be used for aborting any ongoing Rx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable UART Interrupts (Rx)Disable the DMA transfer in the peripheral register (if</li> </ul> |

- enabled) Abort DMA transfer by calling HAL\_DMA\_Abort\_IT  
 (in case of transfer in DMA mode) Set handle State to  
 READY At abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

### **HAL\_UART\_IRQHandler**

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>void HAL_UART_IRQHandler (UART_HandleTypeDef * huart)</b>                 |
| Function description | Handle UART interrupt request.                                               |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                |

### **HAL\_UART\_TxCpltCallback**

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>void HAL_UART_TxCpltCallback (UART_HandleTypeDef * huart)</b>             |
| Function description | Tx Transfer completed callback.                                              |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                |

### **HAL\_UART\_TxHalfCpltCallback**

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>void HAL_UART_TxHalfCpltCallback (UART_HandleTypeDef * huart)</b>         |
| Function description | Tx Half Transfer completed callback.                                         |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                |

### **HAL\_UART\_RxCpltCallback**

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>void HAL_UART_RxCpltCallback (UART_HandleTypeDef * huart)</b>             |
| Function description | Rx Transfer completed callback.                                              |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                |

### **HAL\_UART\_RxHalfCpltCallback**

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| Function name        | <b>void HAL_UART_RxHalfCpltCallback (UART_HandleTypeDef * huart)</b>         |
| Function description | Rx Half Transfer completed callback.                                         |
| Parameters           | <ul style="list-style-type: none"> <li><b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                |

**HAL\_UART\_ErrorCallback**

Function name      **void HAL\_UART\_ErrorCallback (UART\_HandleTypeDef \* huart)**

Function description      UART error callback.

Parameters      •    **huart:** UART handle.

Return values      •    **None**

**HAL\_UART\_AbortCpltCallback**

Function name      **void HAL\_UART\_AbortCpltCallback (UART\_HandleTypeDef \* huart)**

Function description      UART Abort Complete callback.

Parameters      •    **huart:** UART handle.

Return values      •    **None**

**HAL\_UART\_AbortTransmitCpltCallback**

Function name      **void HAL\_UART\_AbortTransmitCpltCallback (UART\_HandleTypeDef \* huart)**

Function description      UART Abort Complete callback.

Parameters      •    **huart:** UART handle.

Return values      •    **None**

**HAL\_UART\_AbortReceiveCpltCallback**

Function name      **void HAL\_UART\_AbortReceiveCpltCallback (UART\_HandleTypeDef \* huart)**

Function description      UART Abort Receive Complete callback.

Parameters      •    **huart:** UART handle.

Return values      •    **None**

**HAL\_MultiProcessor\_EnableMuteMode**

Function name      **HAL\_StatusTypeDef HAL\_MultiProcessor\_EnableMuteMode (UART\_HandleTypeDef \* huart)**

Function description      Enable UART in mute mode (does not mean UART enters mute mode; to enter mute mode, HAL\_MultiProcessor\_EnterMuteMode() API must be called).

Parameters      •    **huart:** UART handle.

Return values      •    **HAL:** status

**HAL\_MultiProcessor\_DisableMuteMode**

|                      |                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_MultiProcessor_DisableMuteMode<br/>(UART_HandleTypeDef * huart)</b>                                       |
| Function description | Disable UART mute mode (does not mean the UART actually exits mute mode as it may not have been in mute mode at this very moment). |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> </ul>                                                     |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                             |

**HAL\_MultiProcessor\_EnterMuteMode**

|                      |                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_MultiProcessor_EnterMuteMode<br/>(UART_HandleTypeDef * huart)</b>                                                        |
| Function description | Enter UART mute mode (means UART actually enters mute mode).                                                                         |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> </ul>                                                       |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                      |
| Notes                | <ul style="list-style-type: none"> <li>• To exit from mute mode, HAL_MultiProcessor_DisableMuteMode() API must be called.</li> </ul> |

**HAL\_HalfDuplex\_EnableTransmitter**

|                      |                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HalfDuplex_EnableTransmitter<br/>(UART_HandleTypeDef * huart)</b> |
| Function description | Enable the UART transmitter and disable the UART receiver.                                 |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> </ul>             |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                     |

**HAL\_HalfDuplex\_EnableReceiver**

|                      |                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HalfDuplex_EnableReceiver<br/>(UART_HandleTypeDef * huart)</b> |
| Function description | Enable the UART receiver and disable the UART transmitter.                              |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> </ul>          |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status.</li> </ul>                 |

**HAL\_LIN\_SendBreak**

|                      |                                                                                |
|----------------------|--------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_LIN_SendBreak<br/>(UART_HandleTypeDef * huart)</b>    |
| Function description | Transmit break characters.                                                     |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>huart:</b> UART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>         |

**HAL\_UART\_GetState**

|                      |                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_UART_StateTypeDef HAL_UART_GetState (UART_HandleTypeDef * huart)</b>                                                                                                   |
| Function description | Return the UART handle state.                                                                                                                                                 |
| Parameters           | <ul style="list-style-type: none"><li>• <b>huart:</b> Pointer to a UART_HandleTypeDef structure that contains the configuration information for the specified UART.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> state</li></ul>                                                                                                           |

**HAL\_UART\_GetError**

|                      |                                                                                                                                                                               |

position in CR1 register

**UART Driver Enable DeAssertion Time LSB Position In CR1 Register**

`UART_CR1_DEDT_ADDRESS_LSB_POS`    UART Driver Enable de-assertion time LSB position in CR1 register

**UART Address-matching LSB Position In CR2 Register**

`UART_CR2_ADDRESS_LSB_POS`    UART address-matching LSB position in CR2 register

**UART Advanced Feature Binary Data Inversion**

`UART_ADVFEATURE_DATAINV_DISABLE`    Binary data inversion disable

`UART_ADVFEATURE_DATAINV_ENABLE`    Binary data inversion enable

**UART Advanced Feature DMA Disable On Rx Error**

`UART_ADVFEATURE_DMA_ENABLEONRXERROR`    DMA enable on Reception Error

`UART_ADVFEATURE_DMA_DISABLEONRXERROR`    DMA disable on Reception Error

**UART DMA Rx**

`UART_DMA_RX_DISABLE`    UART DMA RX disabled

`UART_DMA_RX_ENABLE`    UART DMA RX enabled

**UART DMA Tx**

`UART_DMA_TX_DISABLE`    UART DMA TX disabled

`UART_DMA_TX_ENABLE`    UART DMA TX enabled

**UART DriverEnable Polarity**

`UART_DE_POLARITY_HIGH`    Driver enable signal is active high

`UART_DE_POLARITY_LOW`    Driver enable signal is active low

**UART Error**

`HAL_UART_ERROR_NONE`    No error

`HAL_UART_ERROR_PE`    Parity error

`HAL_UART_ERROR_NE`    Noise error

`HAL_UART_ERROR_FE`    frame error

`HAL_UART_ERROR_ORE`    Overrun error

`HAL_UART_ERROR_DMA`    DMA transfer error

`HAL_UART_ERROR_BUSY`    Busy Error

**UART Exported Macros**

`_HAL_UART_RESET_HANDLE_STA`    **Description:**  
TE

- Reset UART handle states.

**Parameters:**

- `_HANDLE_`: UART handle.

**Return value:**

- None

`__HAL_UART_CLEAR_FEFLAG`

**Return value:**

- None

**Description:**

- Clear the UART FE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_CLEAR_NEFLAG`

**Description:**

- Clear the UART NE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_CLEAR_OREFLAG`

**Description:**

- Clear the UART ORE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_CLEAR_IDLEFLAG`

**Description:**

- Clear the UART IDLE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_GET_FLAG`

**Description:**

- Check whether the specified UART flag is set or not.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.
- `__FLAG__`: specifies the flag to check. This parameter can be one of the following values:
  - `UART_FLAG_RXACK` Receive enable acknowledge flag
  - `UART_FLAG_TEACK` Transmit enable acknowledge flag
  - `UART_FLAG_WUF` Wake up from stop

- mode flag
- UART\_FLAG\_RWU Receiver wake up flag
- UART\_FLAG\_SBKF Send Break flag
- UART\_FLAG\_CMF Character match flag
- UART\_FLAG\_BUSY Busy flag
- UART\_FLAG\_ABRF Auto Baud rate detection flag
- UART\_FLAG\_ABRE Auto Baud rate detection error flag
- UART\_FLAG\_EOBF End of block flag
- UART\_FLAG\_RTOF Receiver timeout flag
- UART\_FLAG\_CTS CTS Change flag (not available for UART4 and UART5)
- UART\_FLAG\_LBDF LIN Break detection flag
- UART\_FLAG\_TXE Transmit data register empty flag
- UART\_FLAG\_TC Transmission Complete flag
- UART\_FLAG\_RXNE Receive data register not empty flag
- UART\_FLAG\_IDLE Idle Line detection flag
- UART\_FLAG\_ORE Overrun Error flag
- UART\_FLAG\_NE Noise Error flag
- UART\_FLAG\_FE Framing Error flag
- UART\_FLAG\_PE Parity Error flag

**Return value:**

- The new state of \_\_FLAG\_\_ (TRUE or FALSE).

**\_\_HAL\_UART\_ENABLE\_IT****Description:**

- Enable the specified UART interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the UART Handle.
- \_\_INTERRUPT\_\_: specifies the UART interrupt source to enable. This parameter can be one of the following values:
  - UART\_IT\_WUF Wakeup from stop mode interrupt
  - UART\_IT\_CM Character match interrupt
  - UART\_IT\_CTS CTS change interrupt
  - UART\_IT\_LBD LIN Break detection interrupt
  - UART\_IT\_TXE Transmit Data Register empty interrupt
  - UART\_IT\_TC Transmission complete interrupt

- UART\_IT\_RXNE Receive Data register not empty interrupt
- UART\_IT\_IDLE Idle line detection interrupt
- UART\_IT\_PE Parity Error interrupt
- UART\_IT\_ERR Error interrupt (Frame error, noise error, overrun error)

**Return value:**

- None

**\_HAL\_UART\_DISABLE\_IT**

- Disable the specified UART interrupt.

**Parameters:**

- HANDLE: specifies the UART Handle.
- INTERRUPT: specifies the UART interrupt source to disable. This parameter can be one of the following values:
  - UART\_IT\_WUF Wakeup from stop mode interrupt
  - UART\_IT\_CM Character match interrupt
  - UART\_IT\_CTS CTS change interrupt
  - UART\_IT\_LBD LIN Break detection interrupt
  - UART\_IT\_TXE Transmit Data Register empty interrupt
  - UART\_IT\_TC Transmission complete interrupt
  - UART\_IT\_RXNE Receive Data register not empty interrupt
  - UART\_IT\_IDLE Idle line detection interrupt
  - UART\_IT\_PE Parity Error interrupt
  - UART\_IT\_ERR Error interrupt (Frame error, noise error, overrun error)

**Return value:**

- None

**\_HAL\_UART\_GET\_IT**

- Check whether the specified UART interrupt has occurred or not.

**Parameters:**

- HANDLE: specifies the UART Handle.
- IT: specifies the UART interrupt to check. This parameter can be one of the following values:
  - UART\_IT\_WUF Wakeup from stop mode interrupt
  - UART\_IT\_CM Character match interrupt

- UART\_IT\_CTS CTS change interrupt (not available for UART4 and UART5)
- UART\_IT\_LBD LIN Break detection interrupt
- UART\_IT\_TXE Transmit Data Register empty interrupt
- UART\_IT\_TC Transmission complete interrupt
- UART\_IT\_RXNE Receive Data register not empty interrupt
- UART\_IT\_IDLE Idle line detection interrupt
- UART\_IT\_ORE Overrun Error interrupt
- UART\_IT\_NE Noise Error interrupt
- UART\_IT\_FE Framing Error interrupt
- UART\_IT\_PE Parity Error interrupt

**Return value:**

- The: new state of `__IT__` (TRUE or FALSE).

**`__HAL_UART_GET_IT_SOURCE`****Description:**

- Check whether the specified UART interrupt source is enabled or not.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.
- `__IT__`: specifies the UART interrupt source to check. This parameter can be one of the following values:
  - UART\_IT\_WUF Wakeup from stop mode interrupt
  - UART\_IT\_CM Character match interrupt
  - UART\_IT\_CTS CTS change interrupt (not available for UART4 and UART5)
  - UART\_IT\_LBD LIN Break detection interrupt
  - UART\_IT\_TXE Transmit Data Register empty interrupt
  - UART\_IT\_TC Transmission complete interrupt
  - UART\_IT\_RXNE Receive Data register not empty interrupt
  - UART\_IT\_IDLE Idle line detection interrupt
  - UART\_IT\_ERR Error interrupt (Frame error, noise error, overrun error)
  - UART\_IT\_PE Parity Error interrupt

**Return value:**

- The: new state of `__IT__` (TRUE or FALSE).

[\\_\\_HAL\\_UART\\_CLEAR\\_IT](#)**Description:**

- Clear the specified UART ISR flag, in setting the proper ICR register flag.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the UART Handle.
- [\\_\\_IT\\_CLEAR\\_\\_](#): specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt This parameter can be one of the following values:
  - [UART\\_CLEAR\\_PEF](#) Parity Error Clear Flag
  - [UART\\_CLEAR\\_FEF](#) Framing Error Clear Flag
  - [UART\\_CLEAR\\_NEF](#) Noise detected Clear Flag
  - [UART\\_CLEAR\\_OREF](#) Overrun Error Clear Flag
  - [UART\\_CLEAR\\_IDLEF](#) IDLE line detected Clear Flag
  - [UART\\_CLEAR\\_TCF](#) Transmission Complete Clear Flag
  - [UART\\_CLEAR\\_LBDF](#) LIN Break Detection Clear Flag
  - [UART\\_CLEAR\\_CTSF](#) CTS Interrupt Clear Flag
  - [UART\\_CLEAR\\_RTOF](#) Receiver Time Out Clear Flag
  - [UART\\_CLEAR\\_EOBF](#) End Of Block Clear Flag
  - [UART\\_CLEAR\\_CMF](#) Character Match Clear Flag
  - [UART\\_CLEAR\\_WUF](#) Wake Up from stop mode Clear Flag

**Return value:**

- None

[\\_\\_HAL\\_UART\\_SEND\\_REQ](#)**Description:**

- Set a specific UART request flag.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the UART Handle.
- [\\_\\_REQ\\_\\_](#): specifies the request flag to set This parameter can be one of the following values:
  - [UART\\_AUTOBAUD\\_REQUEST](#) Auto-Baud Rate Request
  - [UART\\_SENDBREAK\\_REQUEST](#) Send Break Request
  - [UART\\_MUTE\\_MODE\\_REQUEST](#) Mute Mode Request
  - [UART\\_RXDATA\\_FLUSH\\_REQUEST](#)

- Receive Data flush Request
- UART\_TXDATA\_FLUSH\_REQUEST
- Transmit data flush Request

**Return value:**

- None

`__HAL_UART_ONE_BIT_SAMPLE_ENABLE`

**Description:**

- Enable the UART one bit sample method.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_ONE_BIT_SAMPLE_DISABLE`

**Description:**

- Disable the UART one bit sample method.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_ENABLE`

**Description:**

- Enable UART.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_DISABLE`

**Description:**

- Disable UART.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

`__HAL_UART_HWCONTROL_CTS_ENABLE`

**Description:**

- Enable CTS flow control.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

**Notes:**

- This macro allows to enable CTS hardware

flow control for a given UART instance, without need to call HAL\_UART\_Init() function. As involving direct access to UART registers, usage of this macro should be fully endorsed by user. As macro is expected to be used for modifying CTS Hw flow control feature activation, without need for USART instance Deinit/Init, following conditions for macro call should be fulfilled : UART instance should have already been initialised (through call of HAL\_UART\_Init()) macro could only be called when corresponding UART instance is disabled (i.e.

`_HAL_UART_DISABLE(__HANDLE__)`  
and should be followed by an Enable macro (i.e.  
`_HAL_UART_ENABLE(__HANDLE__)`).

### `_HAL_UART_HWCONTROL_CTS_DISABLE`

#### **Description:**

- Disable CTS flow control.

#### **Parameters:**

- `__HANDLE__`: specifies the UART Handle.

#### **Return value:**

- None

#### **Notes:**

• This macro allows to disable CTS hardware flow control for a given UART instance, without need to call HAL\_UART\_Init() function. As involving direct access to UART registers, usage of this macro should be fully endorsed by user. As macro is expected to be used for modifying CTS Hw flow control feature activation, without need for USART instance Deinit/Init, following conditions for macro call should be fulfilled : UART instance should have already been initialised (through call of HAL\_UART\_Init()) macro could only be called when corresponding UART instance is disabled (i.e.  
`_HAL_UART_DISABLE(__HANDLE__)`  
and should be followed by an Enable macro (i.e.  
`_HAL_UART_ENABLE(__HANDLE__)`).

### `_HAL_UART_HWCONTROL_RTS_ENABLE`

#### **Description:**

- Enable RTS flow control.

#### **Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

**Notes:**

- This macro allows to enable RTS hardware flow control for a given UART instance, without need to call HAL\_UART\_Init() function. As involving direct access to UART registers, usage of this macro should be fully endorsed by user. As macro is expected to be used for modifying RTS Hw flow control feature activation, without need for USART instance Deinit/Init, following conditions for macro call should be fulfilled : UART instance should have already been initialised (through call of HAL\_UART\_Init()) macro could only be called when corresponding UART instance is disabled (i.e. `__HAL_UART_DISABLE(__HANDLE__)`) and should be followed by an Enable macro (i.e. `__HAL_UART_ENABLE(__HANDLE__)`).

**`__HAL_UART_HWCONTROL_RTS_DISABLE`****Description:**

- Disable RTS flow control.

**Parameters:**

- `__HANDLE__`: specifies the UART Handle.

**Return value:**

- None

**Notes:**

- This macro allows to disable RTS hardware flow control for a given UART instance, without need to call HAL\_UART\_Init() function. As involving direct access to UART registers, usage of this macro should be fully endorsed by user. As macro is expected to be used for modifying RTS Hw flow control feature activation, without need for USART instance Deinit/Init, following conditions for macro call should be fulfilled : UART instance should have already been initialised (through call of HAL\_UART\_Init()) macro could only be called when corresponding UART instance is disabled (i.e. `__HAL_UART_DISABLE(__HANDLE__)`) and should be followed by an Enable macro (i.e. `__HAL_UART_ENABLE(__HANDLE__)`).

***UART Status Flags***

|                 |                                           |
|-----------------|-------------------------------------------|
| UART_FLAG_RXACK | UART receive enable acknowledge flag      |
| UART_FLAG_TEACK | UART transmit enable acknowledge flag     |
| UART_FLAG_WUF   | UART wake-up from stop mode flag          |
| UART_FLAG_RWU   | UART receiver wake-up from mute mode flag |
| UART_FLAG_SBKF  | UART send break flag                      |
| UART_FLAG_CMF   | UART character match flag                 |
| UART_FLAG_BUSY  | UART busy flag                            |
| UART_FLAG_ABRF  | UART auto Baud rate flag                  |
| UART_FLAG_ABRE  | UART auto Baud rate error                 |
| UART_FLAG_EOBF  | UART end of block flag                    |
| UART_FLAG_RTOF  | UART receiver timeout flag                |
| UART_FLAG_CTS   | UART clear to send flag                   |
| UART_FLAG_CTSIF | UART clear to send interrupt flag         |
| UART_FLAG_LBDF  | UART LIN break detection flag             |
| UART_FLAG_TXE   | UART transmit data register empty         |
| UART_FLAG_TC    | UART transmission complete                |
| UART_FLAG_RXNE  | UART read data register not empty         |
| UART_FLAG_IDLE  | UART idle flag                            |
| UART_FLAG_ORE   | UART overrun error                        |
| UART_FLAG_NE    | UART noise error                          |
| UART_FLAG_FE    | UART frame error                          |
| UART_FLAG_PE    | UART parity error                         |

***UART Half Duplex Selection***

|                          |                           |
|--------------------------|---------------------------|
| UART_HALF_DUPLEX_DISABLE | UART half-duplex disabled |
| UART_HALF_DUPLEX_ENABLE  | UART half-duplex enabled  |

***UART Hardware Flow Control***

|                        |                           |
|------------------------|---------------------------|
| UART_HWCONTROL_NONE    | No hardware control       |
| UART_HWCONTROL_RTS     | Request To Send           |
| UART_HWCONTROL_CTS     | Clear To Send             |
| UART_HWCONTROL_RTS_CTS | Request and Clear To Send |

***UART Interruptions Flag Mask***

|              |                               |
|--------------|-------------------------------|
| UART_IT_MASK | UART interruptions flags mask |
|--------------|-------------------------------|

***UART Interrupts Definition***

|             |                                                |
|-------------|------------------------------------------------|
| UART_IT_PE  | UART parity error interruption                 |
| UART_IT_TXE | UART transmit data register empty interruption |

---

|              |                                                |

| UART_IT_TC   | UART transmission complete interruption        |
| UART_IT_RXNE | UART read data register not empty interruption |
| UART_IT_IDLE | UART idle interruption                         |
| UART_IT_LBD  | UART LIN break detection interruption          |
| UART_IT_CTS  | UART CTS interruption                          |
| UART_IT_CM   | UART character match interruption              |
| UART_IT_WUF  | UART wake-up from stop mode interruption       |
| UART_IT_ERR  | UART error interruption                        |
| UART_IT_ORE  | UART overrun error interruption                |
| UART_IT_NE   | UART noise error interruption                  |
| UART_IT_FE   | UART frame error interruption                  |

***UART Interruption Clear Flags***

|                  |                                   |
|------------------|-----------------------------------|
| UART_CLEAR_PEF   | Parity Error Clear Flag           |
| UART_CLEAR_FEF   | Framing Error Clear Flag          |
| UART_CLEAR_NEF   | Noise detected Clear Flag         |
| UART_CLEAR_OREF  | Overrun Error Clear Flag          |
| UART_CLEAR_IDLEF | IDLE line detected Clear Flag     |
| UART_CLEAR_TCF   | Transmission Complete Clear Flag  |
| UART_CLEAR_LBDF  | LIN Break Detection Clear Flag    |
| UART_CLEAR_CTSF  | CTS Interrupt Clear Flag          |
| UART_CLEAR_RTOF  | Receiver Time Out Clear Flag      |
| UART_CLEAR_EOBF  | End Of Block Clear Flag           |
| UART_CLEAR_CMF   | Character Match Clear Flag        |
| UART_CLEAR_WUF   | Wake Up from stop mode Clear Flag |

***UART Local Interconnection Network mode***

|                  |                                    |
|------------------|------------------------------------|
| UART_LIN_DISABLE | Local Interconnect Network disable |
| UART_LIN_ENABLE  | Local Interconnect Network enable  |

***UART LIN Break Detection***

|                               |                                   |
|-------------------------------|-----------------------------------|
| UART_LINBREAKDETECTLENGTH_10B | LIN 10-bit break detection length |
| UART_LINBREAKDETECTLENGTH_11B | LIN 11-bit break detection length |

***UART Transfer Mode***

|                 |                |
|-----------------|----------------|
| UART_MODE_RX    | RX mode        |
| UART_MODE_TX    | TX mode        |
| UART_MODE_TX_RX | RX and TX mode |

***UART Advanced Feature MSB First***

|                                  |                                                  |
|----------------------------------|--------------------------------------------------|
| UART_ADVFEATURE_MSBFIRST_DISABLE | Most significant bit sent/received first disable |
|----------------------------------|--------------------------------------------------|

|                                 |                                                 |
|---------------------------------|-------------------------------------------------|
| UART_ADVFEATURE_MSBFIRST_ENABLE | Most significant bit sent/received first enable |
|---------------------------------|-------------------------------------------------|

**UART Advanced Feature Mute Mode Enable**

|                                  |                        |
|----------------------------------|------------------------|
| UART_ADVFEATURE_MUTEMODE_DISABLE | UART mute mode disable |
|----------------------------------|------------------------|

|                                 |                       |
|---------------------------------|-----------------------|
| UART_ADVFEATURE_MUTEMODE_ENABLE | UART mute mode enable |
|---------------------------------|-----------------------|

**UART One Bit Sampling Method**

|                             |                          |
|-----------------------------|--------------------------|
| UART_ONE_BIT_SAMPLE_DISABLE | One-bit sampling disable |
|-----------------------------|--------------------------|

|                            |                         |
|----------------------------|-------------------------|
| UART_ONE_BIT_SAMPLE_ENABLE | One-bit sampling enable |
|----------------------------|-------------------------|

**UART Advanced Feature Overrun Disable**

|                                |                   |
|--------------------------------|-------------------|
| UART_ADVFEATURE_OVERRUN_ENABLE | RX overrun enable |
|--------------------------------|-------------------|

|                                 |                    |
|---------------------------------|--------------------|
| UART_ADVFEATURE_OVERRUN_DISABLE | RX overrun disable |
|---------------------------------|--------------------|

**UART Over Sampling**

|                      |                     |
|----------------------|---------------------|
| UART_OVERSAMPLING_16 | Oversampling by 16U |
|----------------------|---------------------|

|---------------------------|-----------------------------|
| UART_TXDATA_FLUSH_REQUEST | Transmit data flush Request |
|---------------------------|-----------------------------|

**UART Advanced Feature RX Pin Active Level Inversion**

|                               |                                       |
|-------------------------------|---------------------------------------|
| UART_ADVFEATURE_RXINV_DISABLE | RX pin active level inversion disable |
|-------------------------------|---------------------------------------|

|                              |                                      |
|------------------------------|--------------------------------------|
| UART_ADVFEATURE_RXINV_ENABLE | RX pin active level inversion enable |
|------------------------------|--------------------------------------|

**UART Advanced Feature RX TX Pins Swap**

|                              |                         |
|------------------------------|-------------------------|
| UART_ADVFEATURE_SWAP_DISABLE | TX/RX pins swap disable |
|------------------------------|-------------------------|

|                             |                        |
|-----------------------------|------------------------|
| UART_ADVFEATURE_SWAP_ENABLE | TX/RX pins swap enable |
|-----------------------------|------------------------|

**UART State**

|                    |               |
|--------------------|---------------|
| UART_STATE_DISABLE | UART disabled |
|--------------------|---------------|

|                   |              |
|-------------------|--------------|
| UART_STATE_ENABLE | UART enabled |
|-------------------|--------------|

## *UART Number of Stop Bits*

|                                |                               |
|--------------------------------|-------------------------------|
| <code>UART_STOPBITS_0_5</code> | UART frame with 0.5 stop bit  |
| <code>UART_STOPBITS_1</code>   | UART frame with 1 stop bit    |
| <code>UART_STOPBITS_1_5</code> | UART frame with 1.5 stop bits |
| <code>UART_STOPBITS_2</code>   | UART frame with 2 stop bits   |

## **UART Advanced Feature Stop Mode Enable**

|                                  |                        |
|----------------------------------|------------------------|
| UART_ADVFEATURE_STOPMODE_DISABLE | UART stop mode disable |
| UART_ADVFEATURE_STOPMODE_ENABLE  | UART stop mode enable  |

### **UART polling-based communications time-out value**

**HAL\_UART\_TIMEOUT\_VALUE**    UART polling-based communications time-out value

## **UART Advanced Feature TX Pin Active Level Inversion**

|                               |                                       |
|-------------------------------|---------------------------------------|
| UART_ADVFEATURE_TXINV_DISABLE | TX pin active level inversion disable |
| UART_ADVFEATURE_TXINV_ENABLE  | TX pin active level inversion enable  |

### **UART WakeUp Address Length**

UART\_ADDRESS\_DETECT\_4B 4-bit long wake-up address  
UART\_ADDRESS\_DETECT\_7B 7-bit long wake-up address

## **UART WakeUp From Stop Selection**

|                                  |                                                 |
|----------------------------------|-------------------------------------------------|
| UART_WAKEUP_ON_ADDRESS           | UART wake-up on address                         |
| UART_WAKEUP_ON_STARTBIT          | UART wake-up on start bit                       |
| UART_WAKEUP_ON_READDATA_NONEMPTY | UART wake-up on receive data register not empty |

## **UART WakeUp Methods**

|                               |                              |
|-------------------------------|------------------------------|
| UART_WAKEUPMETHOD_IDLELINE    | UART wake-up on idle line    |
| UART_WAKEUPMETHOD_ADDRESSMARK | UART wake-up on address mark |

## 55 HAL UART Extension Driver

### 55.1 UARTEEx Firmware driver API description

#### 55.1.1 UART peripheral extended features

#### 55.1.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USARTx or the UARTy in asynchronous mode.

- For the asynchronous mode the parameters below can be configured:
  - Baud Rate
  - Word Length (Fixed to 8-bits only for LIN mode)
  - Stop Bit
  - Parity
  - Hardware flow control
  - Receiver/transmitter modes
  - Over Sampling Method
  - One-Bit Sampling Method
- For the asynchronous mode, the following advanced features can be configured as well:
  - TX and/or RX pin level inversion
  - data logical level inversion
  - RX and TX pins swap
  - RX overrun detection disabling
  - DMA disabling on RX error
  - MSB first on communication line
  - auto Baud rate detection

The HAL\_RS485Ex\_Init() API follows respectively the UART RS485 mode configuration procedures (details for the procedures are available in reference manual).

This section contains the following APIs:

- [\*\*HAL\\_RS485Ex\\_Init\(\)\*\*](#)

#### 55.1.3 IO operation function

This subsection provides functions allowing to manage the UART interrupts and to handle Wake up interrupt call-back.

1. Callback provided in No\_Blocking mode:
  - HAL\_UARTEEx\_WakeupCallback()

This section contains the following APIs:

- [\*\*HAL\\_UARTEEx\\_WakeupCallback\(\)\*\*](#)

#### 55.1.4 Peripheral Control functions

This subsection provides extended functions allowing to control the UART.

- HAL\_UARTEEx\_StopModeWakeUpSourceConfig() API sets Wakeup from Stop mode interrupt flag selection

- `HAL_UARTEx_EnableStopMode()` API allows the UART to wake up the MCU from Stop mode as long as UART clock is HSI or LSE
- `HAL_UARTEx_DisableStopMode()` API disables the above feature
- `HAL_MultiProcessorEx_AddressLength_Set()` API optionally sets the UART node address detection length to more than 4 bits for multiprocessor address mark wake up.

This section contains the following APIs:

- `HAL_UARTEx_StopModeWakeUpSourceConfig()`
- `HAL_UARTEx_EnableStopMode()`
- `HAL_UARTEx_DisableStopMode()`
- `HAL_MultiProcessorEx_AddressLength_Set()`
- `HAL_UARTEx_WakeupCallback()`

### 55.1.5 Detailed description of functions

#### `HAL_RS485Ex_Init`

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

- *uint32\_t CLKLastBit*

##### Field Documentation

- ***uint32\_t USART\_InitTypeDef::BaudRate***

This member configures the Usart communication baud rate. The baud rate is computed using the following formula: Baud Rate Register = ((PCLKx) / ((huart->Init.BaudRate))).

- ***uint32\_t USART\_InitTypeDef::WordLength***

Specifies the number of data bits transmitted or received in a frame. This parameter can be a value of [USARTEx\\_Word\\_Length](#).

- ***uint32\_t USART\_InitTypeDef::StopBits***

Specifies the number of stop bits transmitted. This parameter can be a value of [USART\\_Stop\\_Bits](#).

- ***uint32\_t USART\_InitTypeDef::Parity***

Specifies the parity mode. This parameter can be a value of [USART\\_Parity](#)  
**Note:**When parity is enabled, the computed parity is inserted at the MSB position of the transmitted data (9th bit when the word length is set to 9 data bits; 8th bit when the word length is set to 8 data bits).

- ***uint32\_t USART\_InitTypeDef::Mode***

Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of [USART\\_Mode](#).

- ***uint32\_t USART\_InitTypeDef::CLKPolarity***

Specifies the steady state of the serial clock. This parameter can be a value of [USART\\_Clock\\_Polarity](#).

- ***uint32\_t USART\_InitTypeDef::CLKPhase***

Specifies the clock transition on which the bit capture is made. This parameter can be a value of [USART\\_Clock\\_Phase](#).

- ***uint32\_t USART\_InitTypeDef::CLKLastBit***

Specifies whether the clock pulse corresponding to the last transmitted data bit (MSB) has to be output on the SCLK pin in synchronous mode. This parameter can be a value of [USART\\_Last\\_Bit](#).

## 56.2 USART Firmware driver API description

### 56.2.1 How to use this driver

The USART HAL driver can be used as follows:

1. Declare a USART\_HandleTypeDef handle structure (eg. USART\_HandleTypeDef husart).
2. Initialize the USART low level resources by implementing the HAL\_USART\_MspInit() API:
  - Enable the USARTx interface clock.

- USART pins configuration:
    - Enable the clock for the USART GPIOs.
    - Configure these USART pins as alternate function pull-up.
  - NVIC configuration if you need to use interrupt process (HAL\_USART\_Transmit\_IT(), HAL\_USART\_Receive\_IT() and HAL\_USART\_TransmitReceive\_IT() APIs):
    - Configure the USARTx interrupt priority.
    - Enable the NVIC USART IRQ handle.
  - USART interrupts handling: The specific USART interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros \_\_HAL\_USART\_ENABLE\_IT() and \_\_HAL\_USART\_DISABLE\_IT() inside the transmit and receive process.
  - DMA Configuration if you need to use DMA process (HAL\_USART\_Transmit\_DMA() HAL\_USART\_Receive\_DMA() and HAL\_USART\_TransmitReceive\_DMA() APIs):
    - Declare a DMA handle structure for the Tx/Rx channel.
    - Enable the DMAx interface clock.
    - Configure the declared DMA handle structure with the required Tx/Rx parameters.
    - Configure the DMA Tx/Rx channel.
    - Associate the initialized DMA handle to the USART DMA Tx/Rx handle.
    - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
3. Program the Baud Rate, Word Length, Stop Bit, Parity, Hardware flow control and Mode (Receiver/Transmitter) in the husart handle Init structure.
  4. Initialize the USART registers by calling the HAL\_USART\_Init() API:
    - This API configures also the low level Hardware (GPIO, CLOCK, CORTEX...etc) by calling the customized HAL\_USART\_MspInit(&husart) API.
  5. Three operation modes are available within this driver :

### **Polling mode IO operation**

- Send an amount of data in blocking mode using HAL\_USART\_Transmit()
- Receive an amount of data in blocking mode using HAL\_USART\_Receive()

### **Interrupt mode IO operation**

- Send an amount of data in non blocking mode using HAL\_USART\_Transmit\_IT()
- At transmission end of half transfer HAL\_USART\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_TxHalfCpltCallback
- At transmission end of transfer HAL\_USART\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_TxCpltCallback
- Receive an amount of data in non blocking mode using HAL\_USART\_Receive\_IT()
- At reception end of half transfer HAL\_USART\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_RxHalfCpltCallback
- At reception end of transfer HAL\_USART\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_RxCpltCallback
- In case of transfer Error, HAL\_USART\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_USART\_ErrorCallback

### DMA mode IO operation

- Send an amount of data in non blocking mode (DMA) using HAL\_USART\_Transmit\_DMA()
- At transmission end of half transfer HAL\_USART\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_TxHalfCpltCallback
- At transmission end of transfer HAL\_USART\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_TxCpltCallback
- Receive an amount of data in non blocking mode (DMA) using HAL\_USART\_Receive\_DMA()
- At reception end of half transfer HAL\_USART\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_RxHalfCpltCallback
- At reception end of transfer HAL\_USART\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_USART\_RxCpltCallback
- In case of transfer Error, HAL\_USART\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_USART\_ErrorCallback
- Pause the DMA Transfer using HAL\_USART\_DMAPause()
- Resume the DMA Transfer using HAL\_USART\_DMAResume()
- Stop the DMA Transfer using HAL\_USART\_DMAStop()

### USART HAL driver macros list

Below the list of most used macros in USART HAL driver.

- \_\_HAL\_USART\_ENABLE: Enable the USART peripheral
- \_\_HAL\_USART\_DISABLE: Disable the USART peripheral
- \_\_HAL\_USART\_GET\_FLAG : Check whether the specified USART flag is set or not
- \_\_HAL\_USART\_CLEAR\_FLAG : Clear the specified USART pending flag
- \_\_HAL\_USART\_ENABLE\_IT: Enable the specified USART interrupt
- \_\_HAL\_USART\_DISABLE\_IT: Disable the specified USART interrupt

You can refer to the USART HAL driver header file for more useful macros

To configure and enable/disable the USART to wake up the MCU from stop mode, resort to UART API's HAL\_UARTEStopModeWakeUpSourceConfig(), HAL\_UARTEEnableStopMode() and HAL\_UARTEDisableStopMode() in casting the USART handle to UART type UART\_HandleTypeDef.

#### 56.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USART in asynchronous and in synchronous modes.

- For the asynchronous mode only these parameters can be configured:
  - Baud Rate
  - Word Length
  - Stop Bit

- Parity
- USART polarity
- USART phase
- USART LastBit
- Receiver/transmitter modes

The HAL\_USART\_Init() function follows the USART synchronous configuration procedure (details for the procedure are available in reference manual).

This section contains the following APIs:

- [\*\*HAL\\_USART\\_Init\(\)\*\*](#)
- [\*\*HAL\\_USART\\_DelInit\(\)\*\*](#)
- [\*\*HAL\\_USART\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_USART\\_MspDelInit\(\)\*\*](#)

### 56.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the USART synchronous data transfers.

The USART supports master mode only: it cannot receive or send data related to an input clock (SCLK is always an output).

1. There are two modes of transfer:
  - Blocking mode: The communication is performed in polling mode. The HAL status of all data processing is returned by the same function after finishing transfer.
  - No-Blocking mode: The communication is performed using Interrupts or DMA, These APIs return the HAL status. The end of the data processing will be indicated through the dedicated USART IRQ when using Interrupt mode or the DMA IRQ when using DMA mode. The HAL\_USART\_TxCpltCallback(), HAL\_USART\_RxCpltCallback() and HAL\_USART\_TxRxCpltCallback() user callbacks will be executed respectively at the end of the transmit or Receive process The HAL\_USART\_ErrorCallback() user callback will be executed when a communication error is detected
2. Blocking mode APIs are :
  - HAL\_USART\_Transmit() in simplex mode
  - HAL\_USART\_Receive() in full duplex receive only
  - HAL\_USART\_TransmitReceive() in full duplex mode
3. No-Blocking mode APIs with Interrupt are :
  - HAL\_USART\_Transmit\_IT() in simplex mode
  - HAL\_USART\_Receive\_IT() in full duplex receive only
  - HAL\_USART\_TransmitReceive\_IT() in full duplex mode
  - HAL\_USART\_IRQHandler()
4. No-Blocking mode APIs with DMA are :
  - HAL\_USART\_Transmit\_DMA() in simplex mode
  - HAL\_USART\_Receive\_DMA() in full duplex receive only
  - HAL\_USART\_TransmitReceive\_DMA() in full duplex mode
  - HAL\_USART\_DMAPause()
  - HAL\_USART\_DMAResume()
  - HAL\_USART\_DMAStop()
5. A set of Transfer Complete Callbacks are provided in No-Blocking mode:
  - HAL\_USART\_TxCpltCallback()
  - HAL\_USART\_RxCpltCallback()
  - HAL\_USART\_TxHalfCpltCallback()
  - HAL\_USART\_RxHalfCpltCallback()

- HAL\_USART\_ErrorCallback()
  - HAL\_USART\_TxRxCpltCallback()
6. Non-Blocking mode transfers could be aborted using Abort API's :
- HAL\_USART\_Abort()
  - HAL\_USART\_Abort\_IT()
7. For Abort services based on interrupts (HAL\_USART\_Abort\_IT), a Abort Complete Callbacks is provided:
- HAL\_USART\_AbortCpltCallback()
8. In Non-Blocking mode transfers, possible errors are split into 2 categories. Errors are handled as follows :
- Error is considered as Recoverable and non blocking : Transfer could go till end, but error severity is to be evaluated by user : this concerns Frame Error, Parity Error or Noise Error in Interrupt mode reception . Received character is then retrieved and stored in Rx buffer, Error code is set to allow user to identify error type, and HAL\_USART\_ErrorCallback() user callback is executed. Transfer is kept ongoing on USART side. If user wants to abort it, Abort services should be called by user.
  - Error is considered as Blocking : Transfer could not be completed properly and is aborted. This concerns Overrun Error In Interrupt mode reception and all errors in DMA mode. Error code is set to allow user to identify error type, and HAL\_USART\_ErrorCallback() user callback is executed.

This section contains the following APIs:

- [`HAL\_USART\_Transmit\(\)`](#)
- [`HAL\_USART\_Receive\(\)`](#)
- [`HAL\_USART\_TransmitReceive\(\)`](#)
- [`HAL\_USART\_Transmit\_IT\(\)`](#)
- [`HAL\_USART\_Receive\_IT\(\)`](#)
- [`HAL\_USART\_TransmitReceive\_IT\(\)`](#)
- [`HAL\_USART\_Transmit\_DMA\(\)`](#)
- [`HAL\_USART\_Receive\_DMA\(\)`](#)
- [`HAL\_USART\_TransmitReceive\_DMA\(\)`](#)
- [`HAL\_USART\_DMAPause\(\)`](#)
- [`HAL\_USART\_DMAResume\(\)`](#)
- [`HAL\_USART\_DMAStop\(\)`](#)
- [`HAL\_USART\_Abort\(\)`](#)
- [`HAL\_USART\_Abort\_IT\(\)`](#)
- [`HAL\_USART\_IRQHandler\(\)`](#)
- [`HAL\_USART\_TxCpltCallback\(\)`](#)
- [`HAL\_USART\_TxHalfCpltCallback\(\)`](#)
- [`HAL\_USART\_RxCpltCallback\(\)`](#)
- [`HAL\_USART\_RxHalfCpltCallback\(\)`](#)
- [`HAL\_USART\_TxRxCpltCallback\(\)`](#)
- [`HAL\_USART\_ErrorCallback\(\)`](#)
- [`HAL\_USART\_AbortCpltCallback\(\)`](#)

#### 56.2.4 Peripheral State and Error functions

This subsection provides functions allowing to :

- Return the USART handle state
- Return the USART handle error code

This section contains the following APIs:

- [\*\*\*HAL\\_USART\\_GetState\(\)\*\*\*](#)
- [\*\*\*HAL\\_USART\\_GetError\(\)\*\*\*](#)

### 56.2.5 Detailed description of functions

#### **HAL\_USART\_Init**

|                      |                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_USART_Init<br/>(USART_HandleTypeDef * huart)</b>                                                      |
| Function description | Initialize the USART mode according to the specified parameters in the USART_InitTypeDef and initialize the associated handle. |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>husart:</b> USART handle.</li> </ul>                                               |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                         |

| Notes                | <ul style="list-style-type: none"> <li>When the USART parity is enabled (PCE = 1) the data received contain the parity bit.</li> <li>This function starts a 2 DMA transfers in interrupt mode meaning that DMA half transfer complete, DMA transfer complete and DMA transfer error interrupts are enabled</li> </ul> |

### HAL\_USART\_DMAPause

|                      |                                                                                |
|----------------------|--------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_USART_DMAPause(USART_HandleTypeDef * husart)</b>      |
| Function description | Pause the DMA Transfer.                                                        |
| Parameters           | <ul style="list-style-type: none"> <li><b>husart:</b> USART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>           |

### HAL\_USART\_DMAResume

|                      |                                                                                |
|----------------------|--------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_USART_DMAResume(USART_HandleTypeDef * husart)</b>     |
| Function description | Resume the DMA Transfer.                                                       |
| Parameters           | <ul style="list-style-type: none"> <li><b>husart:</b> USART handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>           |

**HAL\_USART\_DMAMain**

Function name      **HAL\_StatusTypeDef HAL\_USART\_DMAMain  
(USART\_HandleTypeDef \* huart)**

Function description      Stop the DMA Transfer.

Parameters      •    **huart:** USART handle.

Return values      •    **HAL:** status

**HAL\_USART\_Abort**

Function name      **HAL\_StatusTypeDef HAL\_USART\_Abort  
(USART\_HandleTypeDef \* huart)**

Function description      Abort ongoing transfers (blocking mode).

Parameters      •    **huart:** USART handle.

Return values      •    **HAL:** status

Notes      •    This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable USART Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL\_DMA\_Abort (in case of transfer in DMA mode)Set handle State to READY  
•    This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

**HAL\_USART\_Abort\_IT**

Function name      **HAL\_StatusTypeDef HAL\_USART\_Abort\_IT  
(USART\_HandleTypeDef \* huart)**

Function description      Abort ongoing transfers (Interrupt mode).

Parameters      •    **huart:** USART handle.

Return values      •    **HAL:** status

Notes      •    This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable USART Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL\_DMA\_Abort\_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback  
•    This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

**HAL\_USART\_IRQHandler**

Function name      **void HAL\_USART\_IRQHandler (USART\_HandleTypeDef \*  
                        huart)**

Function description      Handle USART interrupt request.

---

| Parameters           | <ul style="list-style-type: none"><li>• <b>husart:</b> USART handle.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>                  |

### **HAL\_USART\_TxRxCpltCallback**

|                      |                                                                                |
|----------------------|--------------------------------------------------------------------------------|
| Function name        | <b>void HAL_USART_TxRxCpltCallback (USART_HandleTypeDef * husart)</b>          |
| Function description | Tx/Rx Transfers completed callback for the non-blocking process.               |
| Parameters           | <ul style="list-style-type: none"><li>• <b>husart:</b> USART handle.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>                  |

**HAL\_USART\_ErrorCallback**

Function name      **void HAL\_USART\_ErrorCallback (USART\_HandleTypeDef \*  
                      husart)**

Function description      USART error callback.

Parameters      •    **husart:** USART handle.

Return values      •    **None**

**HAL\_USART\_AbortCpltCallback**

Function name      **void HAL\_USART\_AbortCpltCallback (USART\_HandleTypeDef  
                      \* husart)**

Function description      USART Abort Complete callback.

Parameters      •    **husart:** USART handle.

Return values      •    **None**

**HAL\_USART\_GetState**

Function name      **HAL\_USART\_StateTypeDef HAL\_USART\_GetState  
(USART\_HandleTypeDef \* husart)**

Function description      Return the USART handle state.

Parameters      •    **husart:** pointer to a USART\_HandleTypeDef structure that  
                      contains the configuration information for the specified  
                      USART.

Return values      •    **USART:** handle state

**HAL\_USART\_GetError**

Function name      **uint32\_t HAL\_USART\_GetError (USART\_HandleTypeDef \*  
                      husart)**

Function description      Return the USART error code.

Parameters      •    **husart:** pointer to a USART\_HandleTypeDef structure that  
                      contains the configuration information for the specified  
                      USART.

Return values      •    **USART:** handle Error Code

## 56.3 USART Firmware driver defines

### 56.3.1 USART

#### *USART Clock*

**USART\_CLOCK\_DISABLE**    USART clock disable

**USART\_CLOCK\_ENABLE**    USART clock enable

#### *USART Clock Phase*

**USART\_PHASE\_1EDGE**    USART frame phase on first clock transition

**USART\_PHASE\_2EDGE** USART frame phase on second clock transition

#### **USART Clock Polarity**

**USART\_POLARITY\_LOW** USART Clock signal is steady Low

**USART\_POLARITY\_HIGH** USART Clock signal is steady High

#### **USART Error**

**HAL\_USART\_ERROR\_NONE** No error

**HAL\_USART\_ERROR\_PE** Parity error

**HAL\_USART\_ERROR\_NE** Noise error

**HAL\_USART\_ERROR\_FE** frame error

**HAL\_USART\_ERROR\_ORE** Overrun error

**HAL\_USART\_ERROR\_DMA** DMA transfer error

#### **USART Exported Macros**

- USART\_FLAG\_RXNE Receive data register not empty flag
- USART\_FLAG\_IDLE Idle Line detection flag
- USART\_FLAG\_ORE OverRun Error flag
- USART\_FLAG\_NE Noise Error flag
- USART\_FLAG\_FE Framing Error flag
- USART\_FLAG\_PE Parity Error flag

**Return value:**

- The new state of \_\_FLAG\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_USART\\_CLEAR\\_FLAG](#)**Description:**

- Clear the specified USART pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the USART Handle.
- \_\_FLAG\_\_: specifies the flag to check. This parameter can be any combination of the following values:
  - USART\_CLEAR\_PEF
  - USART\_CLEAR\_FEF
  - USART\_CLEAR\_NEF
  - USART\_CLEAR\_OREF
  - USART\_CLEAR\_IDLEF
  - USART\_CLEAR\_TCF
  - USART\_CLEAR\_CTSF

**Return value:**

- None

[\\_\\_HAL\\_USART\\_CLEAR\\_PEEFLAG](#)**Description:**

- Clear the USART PE pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the USART Handle.

**Return value:**

- None

[\\_\\_HAL\\_USART\\_CLEAR\\_FEFLAG](#)**Description:**

- Clear the USART FE pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the USART Handle.

**Return value:**

- None

[\\_\\_HAL\\_USART\\_CLEAR\\_NEFLAG](#)**Description:**

- Clear the USART NE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.

**Return value:**

- None

`__HAL_USART_CLEAR_OREFLAG`

**Description:**

- Clear the USART ORE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.

**Return value:**

- None

`__HAL_USART_CLEAR_IDLEFLAG`

**Description:**

- Clear the USART IDLE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.

**Return value:**

- None

`__HAL_USART_ENABLE_IT`

**Description:**

- Enable the specified USART interrupt.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.
- `__INTERRUPT__`: specifies the USART interrupt source to enable. This parameter can be one of the following values:
  - USART\_IT\_TXE Transmit Data Register empty interrupt
  - USART\_IT\_TC Transmission complete interrupt
  - USART\_IT\_RXNE Receive Data register not empty interrupt
  - USART\_IT\_IDLE Idle line detection interrupt
  - USART\_IT\_PE Parity Error interrupt
  - USART\_IT\_ERR Error interrupt(Frame error, noise error, overrun error)

**Return value:**

- None

`__HAL_USART_DISABLE_IT`

**Description:**

- Disable the specified USART interrupt.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.
- `__INTERRUPT__`: specifies the USART

interrupt source to disable. This parameter can be one of the following values:

- USART\_IT\_TXE Transmit Data Register empty interrupt
- USART\_IT\_TC Transmission complete interrupt
- USART\_IT\_RXNE Receive Data register not empty interrupt
- USART\_IT\_IDLE Idle line detection interrupt
- USART\_IT\_PE Parity Error interrupt
- USART\_IT\_ERR Error interrupt(Frame error, noise error, overrun error)

#### **Return value:**

- None

### [\\_\\_HAL\\_USART\\_GET\\_IT](#)

#### **Description:**

- Check whether the specified USART interrupt has occurred or not.

#### **Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the USART Handle.
- [\\_\\_IT\\_\\_](#): specifies the USART interrupt source to check. This parameter can be one of the following values:
  - USART\_IT\_TXE Transmit Data Register empty interrupt
  - USART\_IT\_TC Transmission complete interrupt
  - USART\_IT\_RXNE Receive Data register not empty interrupt
  - USART\_IT\_IDLE Idle line detection interrupt
  - USART\_IT\_ORE OverRun Error interrupt
  - USART\_IT\_NE Noise Error interrupt
  - USART\_IT\_FE Framing Error interrupt
  - USART\_IT\_PE Parity Error interrupt

#### **Return value:**

- The: new state of [\\_\\_IT\\_\\_](#) (TRUE or FALSE).

### [\\_\\_HAL\\_USART\\_GET\\_IT\\_SOURCE](#)

#### **Description:**

- Check whether the specified USART interrupt source is enabled or not.

#### **Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the USART Handle.
- [\\_\\_IT\\_\\_](#): specifies the USART interrupt source to check. This parameter can be one of the following values:
  - USART\_IT\_TXE Transmit Data Register empty interrupt

- USART\_IT\_TC Transmission complete interrupt
- USART\_IT\_RXNE Receive Data register not empty interrupt
- USART\_IT\_IDLE Idle line detection interrupt
- USART\_IT\_ORE OverRun Error interrupt
- USART\_IT\_NE Noise Error interrupt
- USART\_IT\_FE Framing Error interrupt
- USART\_IT\_PE Parity Error interrupt

**Return value:**

- The new state of `__IT__` (TRUE or FALSE).

`__HAL_USART_CLEAR_IT`**Description:**

- Clear the specified USART ISR flag, in setting the proper ICR register flag.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.
- `__IT_CLEAR__`: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt. This parameter can be one of the following values:
  - `USART_CLEAR_PEF` Parity Error Clear Flag
  - `USART_CLEAR_FEF` Framing Error Clear Flag
  - `USART_CLEAR_NEF` Noise detected Clear Flag
  - `USART_CLEAR_OREF` OverRun Error Clear Flag
  - `USART_CLEAR_IDLEF` IDLE line detected Clear Flag
  - `USART_CLEAR_TCF` Transmission Complete Clear Flag
  - `USART_CLEAR_CTSF` CTS Interrupt Clear Flag

**Return value:**

- None

`__HAL_USART_SEND_REQ`**Description:**

- Set a specific USART request flag.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.
- `__REQ__`: specifies the request flag to set. This parameter can be one of the following values:
  - `USART_RXDATA_FLUSH_REQUEST` Receive Data flush Request
  - `USART_TXDATA_FLUSH_REQUEST`

---

Transmit data flush Request**Return value:**

- None

`__HAL_USART_ONE_BIT_SAMPLE  
_ENABLE`

**Description:**

- Enable the USART one bit sample method.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.

**Return value:**

- None

`__HAL_USART_ONE_BIT_SAMPLE  
_DISABLE`

**Description:**

- Disable the USART one bit sample method.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.

**Return value:**

- None

`__HAL_USART_ENABLE`

**Description:**

- Enable USART.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.

**Return value:**

- None

`__HAL_USART_DISABLE`

**Description:**

- Disable USART.

**Parameters:**

- `__HANDLE__`: specifies the USART Handle.

**Return value:**

- None

WWDG required parameters

### 58.2 WWDG Firmware driver API description

#### 58.2.1 WWDG specific features

Once enabled the WWDG generates a system reset on expiry of a programmed time period, unless the program refreshes the counter (T[6U;0] downcounter) before reaching 0x3F value (i.e. a reset is generated when the counter value rolls over from 0x40 to 0x3FU).

- An MCU reset is also generated if the counter value is refreshed before the counter has reached the refresh window value. This implies that the counter must be refreshed in a limited window.
- Once enabled the WWDG cannot be disabled except by a system reset.

- WWDRST flag in RCC\_CSR register informs when a WWDG reset has occurred (check available with \_\_HAL\_RCC\_GET\_FLAG(RCC\_FLAG\_WWDGRST)).
- The WWDG downcounter input clock is derived from the APB clock divided by a programmable prescaler.
- WWDG downcounter clock (Hz) = PCLK1 / (4096U \* Prescaler)
- WWDG timeout (ms) = (1000U \* (T[5U;0] + 1U)) / (WWDG downcounter clock) where T[5U;0] are the lowest 6 bits of downcounter.
- WWDG Counter refresh is allowed between the following limits :
  - min time (ms) = (1000U \* (T[5U;0] - Window)) / (WWDG downcounter clock)
  - max time (ms) = (1000U \* (T[5U;0] - 0x40U)) / (WWDG downcounter clock)
- Min-max timeout value @42 MHz(PCLK1): ~97.5 us / ~49.9 ms
- The Early Wakeup Interrupt (EWI) can be used if specific safety operations or data logging must be performed before the actual reset is generated. When the downcounter reaches the value 0x40U, an EWI interrupt is generated and the corresponding interrupt service routine (ISR) can be used to trigger specific actions (such as communications or data logging), before resetting the device. In some applications, the EWI interrupt can be used to manage a software system check and/or system recovery/graceful degradation, without generating a WWDG reset. In this case, the corresponding interrupt service routine (ISR) should reload the WWDG counter to avoid the WWDG reset, then trigger the required actions. Note:When the EWI interrupt cannot be served, e.g. due to a system lock in a higher priority task, the WWDG reset will eventually be generated.
- Debug mode : When the microcontroller enters debug mode (core halted), the WWDG counter either continues to work normally or stops, depending on DBG\_WWDG\_STOP configuration bit in DBG module, accessible through \_\_HAL\_DBGMCU\_FREEZE\_WWDG() and \_\_HAL\_DBGMCU\_UNFREEZE\_WWDG() macros

### 58.2.2 How to use this driver

- Enable WWDG APB1 clock using \_\_HAL\_RCC\_WWDG\_CLK\_ENABLE().
- Set the WWDG prescaler, refresh window, counter value and Early Wakeup Interrupt mode using using HAL\_WWDG\_Init() function. This enables WWDG peripheral and the downcounter starts downcounting from given counter value. Init function can be called again to modify all watchdog parameters, however if EWI mode has been set once, it can't be clear until next reset.
- The application program must refresh the WWDG counter at regular intervals during normal operation to prevent an MCU reset using HAL\_WWDG\_Refresh() function. This operation must occur only when the counter is lower than the window value already programmed.
- if Early Wakeup Interrupt mode is enable an interrupt is generated when the counter reaches 0x40. User can add his own code in weak function HAL\_WWDG\_EarlyWakeupCallback().

### WWDG HAL driver macros list

Below the list of most used macros in WWDG HAL driver.

- \_\_HAL\_WWDG\_GET\_IT\_SOURCE: Check the selected WWDG's interrupt source.
- \_\_HAL\_WWDG\_GET\_FLAG: Get the selected WWDG's flag status.
- \_\_HAL\_WWDG\_CLEAR\_FLAG: Clear the WWDG's pending flags.

### 58.2.3 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and start the WWDG according to the specified parameters in the WWDG\_InitTypeDef of associated handle.
- Initialize the WWDG MSP.

This section contains the following APIs:

- [\*HAL\\_WWDG\\_Init\(\)\*](#)
- [\*HAL\\_WWDG\\_MspInit\(\)\*](#)

### 58.2.4 IO operation functions

This section provides functions allowing to:

- Refresh the WWDG.
- Handle WWDG interrupt request and associated function callback.

This section contains the following APIs:

- [\*HAL\\_WWDG\\_Refresh\(\)\*](#)
- [\*HAL\\_WWDG\\_IRQHandler\(\)\*](#)
- [\*HAL\\_WWDG\\_EarlyWakeupCallback\(\)\*](#)

### 58.2.5 Detailed description of functions

#### **HAL\_WWDG\_Init**

|                      |                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_WWDG_Init<br/>(WWDG_HandleTypeDef * hwdg)</b>                                                                                                                |
| Function description | Initialize the WWDG according to the specified.                                                                                                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hwdg:</b> pointer to a WWDG_HandleTypeDef structure that contains the configuration information for the specified WWDG module.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                |

#### **HAL\_WWDG\_MspInit**

|                      |                                                                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_WWDG_MspInit (WWDG_HandleTypeDef * hwdg)</b>                                                                                                                                                             |
| Function description | Initialize the WWDG MSP.                                                                                                                                                                                             |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hwdg:</b> pointer to a WWDG_HandleTypeDef structure that contains the configuration information for the specified WWDG module.</li> </ul>                                |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                                                      |
| Notes                | <ul style="list-style-type: none"> <li>• When rewriting this function in user file, mechanism may be added to avoid multiple initialize when HAL_WWDG_Init function is called again to change parameters.</li> </ul> |

**HAL\_WWDG\_Refresh**

|                      |                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_WWDG_Refresh<br/>(WWDG_HandleTypeDef * hwdg)</b>                                                                                                             |
| Function description | Refresh the WWDG.                                                                                                                                                                     |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hwdg:</b> pointer to a WWDG_HandleTypeDef structure that contains the configuration information for the specified WWDG module.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                |

**HAL\_WWDG\_IRQHandler**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_WWDG_IRQHandler (WWDG_HandleTypeDef * hwdg)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Function description | Handle WWDG interrupt request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hwdg:</b> pointer to a WWDG_HandleTypeDef structure that contains the configuration information for the specified WWDG module.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Notes                | <ul style="list-style-type: none"> <li>• The Early Wakeup Interrupt (EWI) can be used if specific safety operations or data logging must be performed before the actual reset is generated. The EWI interrupt is enabled by calling HAL_WWDG_Init function with EWIMode set to WWDG_EWI_ENABLE. When the downcounter reaches the value 0x40, and EWI interrupt is generated and the corresponding Interrupt Service Routine (ISR) can be used to trigger specific actions (such as communications or data logging), before resetting the device.</li> </ul> |

**HAL\_WWDG\_EarlyWakeupCallback**

|                      |                                                                                                                                                                                       |

## 58.3 WWDG Firmware driver defines

### 58.3.1 WWDG

***WWDG Early Wakeup Interrupt Mode***

**WWDG\_EWI\_DISABLE**    EWI Disable  
**WWDG\_EWI\_ENABLE**    EWI Enable

**WWDG Exported Macros**`_HAL_WWDG_ENABLE`**Description:**

- Enable the WWDG peripheral.

**Parameters:**

- `_HANDLE_`: WWDG handle

**Return value:**

- None

`_HAL_WWDG_ENABLE_IT`**Description:**

- Enable the WWDG early wakeup interrupt.

**Parameters:**

- `_HANDLE_`: WWDG handle
- `_INTERRUPT_`: specifies the interrupt to enable. This parameter can be one of the following values:
  - `WWDG_IT_EWI`: Early wakeup interrupt

**Return value:**

- None

**Notes:**

- Once enabled this interrupt cannot be disabled except by a system reset.

`_HAL_WWDG_GET_IT`**Description:**

- Check whether the selected WWDG interrupt has occurred or not.

**Parameters:**

- `_HANDLE_`: WWDG handle
- `_INTERRUPT_`: specifies the it to check. This parameter can be one of the following values:
  - `WWDG_FLAG_EWIF`: Early wakeup interrupt IT

**Return value:**

- The: new state of `WWDG_FLAG` (SET or RESET).

`_HAL_WWDG_CLEAR_IT`**Description:**

- Clear the WWDG interrupt pending bits.

**Parameters:**

- `_HANDLE_`: WWDG handle
- `_INTERRUPT_`: specifies the interrupt pending bit to clear. This parameter can be one of the following values:
  - `WWDG_FLAG_EWIF`: Early wakeup interrupt flag

[\\_\\_HAL\\_WWDG\\_GET\\_FLAG](#)**Description:**

- Check whether the specified WWdg flag is set or not.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): WWdg handle
- [\\_\\_FLAG\\_\\_](#): specifies the flag to check. This parameter can be one of the following values:
  - [WWDG\\_FLAG\\_EWIF](#): Early wakeup interrupt flag

**Return value:**

- The: new state of [WWDG\\_FLAG](#) (SET or RESET).

[\\_\\_HAL\\_WWDG\\_CLEAR\\_FLAG](#)**Description:**

- Clear the WWdg's pending flags.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): WWdg handle
- [\\_\\_FLAG\\_\\_](#): specifies the flag to clear. This parameter can be one of the following values:
  - [WWDG\\_FLAG\\_EWIF](#): Early wakeup interrupt flag

**Return value:**

- None

[\\_\\_HAL\\_WWDG\\_GET\\_IT\\_SOURCE](#)**Description:**

- Check whether the specified WWdg interrupt source is enabled or not.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): WWdg Handle.
- [\\_\\_INTERRUPT\\_\\_](#): specifies the WWdg interrupt source to check. This parameter can be one of the following values:
  - [WWDG\\_IT\\_EWI](#): Early Wakeup Interrupt

**Return value:**

- state: of [\\_\\_INTERRUPT\\_\\_](#) (TRUE or FALSE).

***WWdg Flag definition***

[WWDG\\_FLAG\\_EWIF](#) Early wakeup interrupt flag

***WWdg Interrupt definition***

[WWDG\\_IT\\_EWI](#) Early wakeup interrupt

***WWDG Prescaler***

- WWDG\_PRESCALER\_1    WWDG counter clock = (PCLK1/4096U)/1U
- WWDG\_PRESCALER\_2    WWDG counter clock = (PCLK1/4096U)/2U
- WWDG\_PRESCALER\_4    WWDG counter clock = (PCLK1/4096U)/4U
- WWDG\_PRESCALER\_8    WWDG counter clock = (PCLK1/4096U)/8U

## 59 LL ADC Generic Driver

### 59.1 ADC Firmware driver registers structures

#### 59.1.1 LL\_ADC\_CommonInitTypeDef

##### Data Fields

- *uint32\_t CommonClock*
- *uint32\_t Multimode*
- *uint32\_t MultiDMATransfer*
- *uint32\_t MultiTwoSamplingDelay*

##### Field Documentation

- *uint32\_t LL\_ADC\_CommonInitTypeDef::CommonClock*

Set parameter common to several ADC: Clock source and prescaler. This parameter can be a value of [ADC\\_LL\\_EC\\_COMMON\\_CLOCK\\_SOURCE](#)

**Note:**On this STM32 serie, if ADC group injected is used, some clock ratio constraints between ADC clock and AHB clock must be respected. Refer to reference manual.

This feature can be modified afterwards using unitary function

[LL\\_ADC\\_SetCommonClock\(\)](#).

- *uint32\_t LL\_ADC\_CommonInitTypeDef::Multimode*

Set ADC multimode configuration to operate in independent mode or multimode (for devices with several ADC instances). This parameter can be a value of [ADC\\_LL\\_EC\\_MULTI\\_MODE](#)

This feature can be modified afterwards using unitary function [LL\\_ADC\\_SetMultimode\(\)](#).

- *uint32\_t LL\_ADC\_CommonInitTypeDef::MultiDMATransfer*

Set ADC multimode conversion data transfer: no transfer or transfer by DMA. This parameter can be a value of [ADC\\_LL\\_EC\\_MULTI\\_DMA\\_TRANSFER](#)

This feature can be modified afterwards using unitary function [LL\\_ADC\\_SetMultiDMATransfer\(\)](#).

- *uint32\_t LL\_ADC\_CommonInitTypeDef::MultiTwoSamplingDelay*

Set ADC multimode delay between 2 sampling phases. This parameter can be a value of [ADC\\_LL\\_EC\\_MULTI\\_TWOSMP\\_DELAY](#)

This feature can be modified afterwards using unitary function [LL\\_ADC\\_SetMultiTwoSamplingDelay\(\)](#).

#### 59.1.2 LL\_ADC\_InitTypeDef

##### Data Fields

- *uint32\_t Resolution*
- *uint32\_t DataAlignment*
- *uint32\_t LowPowerMode*

##### Field Documentation

- *uint32\_t LL\_ADC\_InitTypeDef::Resolution*

Set ADC resolution. This parameter can be a value of

[ADC\\_LL\\_EC\\_RESOLUTION](#)

This feature can be modified afterwards using unitary function [LL\\_ADC\\_SetResolution\(\)](#).

- *uint32\_t LL\_ADC\_InitTypeDef::DataAlignment*

Set ADC conversion data alignment. This parameter can be a value of

[ADC\\_LL\\_EC\\_DATA\\_ALIGN](#)

This feature can be modified afterwards using unitary function [LL\\_ADC\\_SetDataAlignment\(\)](#).

- ***uint32\_t LL\_ADC\_InitTypeDef::LowPowerMode***  
Set ADC low power mode. This parameter can be a value of ***ADC\_LL\_EC\_LP\_MODE***This feature can be modified afterwards using unitary function ***LL\_ADC\_SetLowPowerMode()***.

### 59.1.3 LL\_ADC\_REG\_InitTypeDef

#### Data Fields

- ***uint32\_t TriggerSource***
- ***uint32\_t SequencerLength***
- ***uint32\_t SequencerDiscont***
- ***uint32\_t ContinuousMode***
- ***uint32\_t DMATransfer***
- ***uint32\_t Overrun***

#### Field Documentation

- ***uint32\_t LL\_ADC\_REG\_InitTypeDef::TriggerSource***  
Set ADC group regular conversion trigger source: internal (SW start) or from external IP (timer event, external interrupt line). This parameter can be a value of ***ADC\_LL\_EC\_REG\_TRIGGER\_SOURCE***  
**Note:**On this STM32 serie, setting trigger source to external trigger also set trigger polarity to rising edge (default setting for compatibility with some ADC on other STM32 families having this setting set by HW default value). In case of need to modify trigger edge, use function ***LL\_ADC\_REG\_SetTriggerEdge()***. This feature can be modified afterwards using unitary function ***LL\_ADC\_REG\_SetTriggerSource()***.
- ***uint32\_t LL\_ADC\_REG\_InitTypeDef::SequencerLength***  
Set ADC group regular sequencer length. This parameter can be a value of ***ADC\_LL\_EC\_REG\_SEQ\_SCAN\_LENGTH***This feature can be modified afterwards using unitary function ***LL\_ADC\_REG\_SetSequencerLength()***.
- ***uint32\_t LL\_ADC\_REG\_InitTypeDef::SequencerDiscont***  
Set ADC group regular sequencer discontinuous mode: sequence subdivided and scan conversions interrupted every selected number of ranks. This parameter can be a value of ***ADC\_LL\_EC\_REG\_SEQ\_DISCONT\_MODE***  
**Note:**This parameter has an effect only if group regular sequencer is enabled (scan length of 2 ranks or more). This feature can be modified afterwards using unitary function ***LL\_ADC\_REG\_SetSequencerDiscont()***.
- ***uint32\_t LL\_ADC\_REG\_InitTypeDef::ContinuousMode***  
Set ADC continuous conversion mode on ADC group regular, whether ADC conversions are performed in single mode (one conversion per trigger) or in continuous mode (after the first trigger, following conversions launched successively automatically). This parameter can be a value of ***ADC\_LL\_EC\_REG\_CONTINUOUS\_MODE*** Note: It is not possible to enable both ADC group regular continuous mode and discontinuous mode.This feature can be modified afterwards using unitary function ***LL\_ADC\_REG\_SetContinuousMode()***.
- ***uint32\_t LL\_ADC\_REG\_InitTypeDef::DMATransfer***  
Set ADC group regular conversion data transfer: no transfer or transfer by DMA, and DMA requests mode. This parameter can be a value of ***ADC\_LL\_EC\_REG\_DMA\_TRANSFER***This feature can be modified afterwards using unitary function ***LL\_ADC\_REG\_SetDMATransfer()***.
- ***uint32\_t LL\_ADC\_REG\_InitTypeDef::Overrun***  
Set ADC group regular behavior in case of overrun: data preserved or overwritten. This parameter can be a value of ***ADC\_LL\_EC\_REG\_OVR\_DATA\_BEHAVIOR***This feature can be modified afterwards using unitary function ***LL\_ADC\_REG\_SetOverrun()***.

### 59.1.4 LL\_ADC\_INJ\_InitTypeDef

#### Data Fields

- *uint32\_t TriggerSource*
- *uint32\_t SequencerLength*
- *uint32\_t SequencerDiscont*
- *uint32\_t TrigAuto*

#### Field Documentation

- *uint32\_t LL\_ADC\_INJ\_InitTypeDef::TriggerSource*

Set ADC group injected conversion trigger source: internal (SW start) or from external IP (timer event, external interrupt line). This parameter can be a value of [\*\*ADC\\_LL\\_EC\\_INJ\\_TRIGGER\\_SOURCE\*\*](#)

**Note:**On this STM32 serie, setting trigger source to external trigger also set trigger polarity to rising edge (default setting for compatibility with some ADC on other STM32 families having this setting set by HW default value). In case of need to modify trigger edge, use function [\*\*LL\\_ADC\\_INJ\\_SetTriggerEdge\(\)\*\*](#). This feature can be modified afterwards using unitary function [\*\*LL\\_ADC\\_INJ\\_SetTriggerSource\(\)\*\*](#).

- *uint32\_t LL\_ADC\_INJ\_InitTypeDef::SequencerLength*

Set ADC group injected sequencer length. This parameter can be a value of [\*\*ADC\\_LL\\_EC\\_INJ\\_SEQ\\_SCAN\\_LENGTH\*\*](#)This feature can be modified afterwards using unitary function [\*\*LL\\_ADC\\_INJ\\_SetSequencerLength\(\)\*\*](#).

- *uint32\_t LL\_ADC\_INJ\_InitTypeDef::SequencerDiscont*

Set ADC group injected sequencer discontinuous mode: sequence subdivided and scan conversions interrupted every selected number of ranks. This parameter can be a value of [\*\*ADC\\_LL\\_EC\\_INJ\\_SEQ\\_DISCONT\\_MODE\*\*](#)

**Note:**This parameter has an effect only if group injected sequencer is enabled (scan length of 2 ranks or more). This feature can be modified afterwards using unitary function [\*\*LL\\_ADC\\_INJ\\_SetSequencerDiscont\(\)\*\*](#).

- *uint32\_t LL\_ADC\_INJ\_InitTypeDef::TrigAuto*

Set ADC group injected conversion trigger: independent or from ADC group regular. This parameter can be a value of [\*\*ADC\\_LL\\_EC\\_INJ\\_TRIG\\_AUTO\*\*](#) Note: This parameter must be set to set to independent trigger if injected trigger source is set to an external trigger.This feature can be modified afterwards using unitary function [\*\*LL\\_ADC\\_INJ\\_SetTrigAuto\(\)\*\*](#).

## 59.2 ADC Firmware driver API description

### 59.2.1 Detailed description of functions

#### LL\_ADC\_DMA\_GetRegAddr

Function name [\\_\\_STATIC\\_INLINE uint32\\_t LL\\_ADC\\_DMA\\_GetRegAddr\(ADC\\_TypeDef \\* ADCx, uint32\\_t Register\)](#)

Function description Function to help to configure DMA transfer from ADC: retrieve the ADC register address from ADC instance and a list of ADC registers intended to be used (most commonly) with DMA transfer.

Parameters
 

- **ADCx:** ADC instance
- **Register:** This parameter can be one of the following values:  
(1) Available on devices with several ADC instances.
  - [\*\*LL\\_ADC\\_DMA\\_REG\\_REGULAR\\_DATA\*\*](#)
  - [\*\*LL\\_ADC\\_DMA\\_REG\\_REGULAR\\_DATA\\_MULTI\*\*](#) (1)

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Notes                | <ul style="list-style-type: none"> <li>This function is intended to set calibration parameters without having to perform a new calibration using LL_ADC_StartCalibration().</li> </ul>                                                                                                                                                                                                             |

- For devices with differential mode available: Calibration of offset is specific to each of single-ended and differential modes (calibration factor must be specified for each of these differential modes, if used afterwards and if the application requires their calibration).
- In case of setting calibration factors of both modes single ended and differential (parameter LL\_ADC\_BOTH\_SINGLE\_DIFF\_ENDED): both calibration factors must be concatenated. To perform this processing, use helper macro \_\_LL\_ADC\_CALIB\_FACTOR\_SINGLE\_DIFF().
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be enabled, without calibration on going, without conversion on going on group regular.

| Notes                | <ul style="list-style-type: none"> <li>• Description of ADC low power modes: ADC low power mode "auto wait": Dynamic low power mode, ADC conversions occurrences are limited to the minimum necessary in order to reduce power consumption. New ADC conversion starts only when the previous unitary conversion data (for ADC group regular) or previous sequence conversions data (for ADC group injected) has been retrieved by user software. In the meantime, ADC remains idle: does not performs any other conversion. This mode allows to automatically adapt the ADC conversions triggers to the speed of the software that reads the data. Moreover, this avoids risk of overrun for low frequency applications. How to use this low power mode: Do not use with interruption or DMA since these modes have to clear immediately the EOC flag to free the IRQ vector sequencer. Do use with polling: 1. Start conversion, 2. Later on, when conversion data is needed: poll for end of conversion to ensure that conversion is completed and retrieve ADC conversion data. This will trig another ADC conversion start. ADC low power mode "auto power-off" (feature available on this device if parameter LL_ADC_LP_MODE_AUTOOFF is available): the ADC automatically powers-off after a conversion and automatically wakes up when a new conversion is triggered (with startup time between trigger and start of sampling). This feature can</li> </ul> |

be combined with low power mode "auto wait".

- With ADC low power mode "auto wait", the ADC conversion data read is corresponding to previous ADC conversion start, independently of delay during which ADC was idle. Therefore, the ADC conversion data may be outdated: does not correspond to the current voltage level on the selected ADC channel.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on either groups regular or injected.

| Notes                | <ul style="list-style-type: none"> <li>Description of ADC low power modes: ADC low power mode "auto wait": Dynamic low power mode, ADC conversions occurrences are limited to the minimum necessary in order to reduce power consumption. New ADC conversion starts only when the previous unitary conversion data (for ADC group regular) or previous sequence conversions data (for ADC group injected) has been retrieved by user software. In the meantime, ADC remains idle: does not perform any other conversion. This mode allows to automatically adapt the ADC conversions triggers to the speed of the software that reads the data. Moreover, this avoids risk of overrun for low frequency applications. How to use this low power mode: Do not use with interruption or DMA since these modes have to clear immediately the EOC flag to free the IRQ vector sequencer. Do use with polling: 1. Start conversion, 2. Later on, when conversion data is needed: poll for end of conversion to ensure that conversion is completed and retrieve ADC conversion data. This will trigger another ADC conversion start. ADC low power mode "auto power-off" (feature available on this device if parameter LL_ADC_LP_MODE_AUTOOFF is available): the ADC automatically powers-off after a conversion and automatically wakes up when a new conversion is triggered (with startup time between trigger and start of sampling). This feature can be combined with low power mode "auto wait".</li> <li>With ADC low power mode "auto wait", the ADC conversion data read is corresponding to previous ADC conversion start, independently of delay during which ADC was idle. Therefore, the ADC conversion data may be outdated: does not</li> </ul> |

correspond to the current voltage level on the selected ADC channel.

- (2) On STM32F3, parameter available only on ADC instance: ADC2.
- (3) On STM32F3, parameter available only on ADC instance: ADC3.
- (4) On STM32F3, parameter available only on ADC instances: ADC4.
- (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to Vrefint at the same time.
- (1, 2, 3, 4, 5) For ADC channel read back from ADC register, comparison with internal channel parameter to be done using helper macro  
`_LL_ADC_CHANNEL_INTERNAL_TO_EXTERNAL()`.

**Notes**

- Usage of the returned channel number: To reinject this channel into another function LL\_ADC\_xxx: the returned channel number is only partly formatted on definition of literals LL\_ADC\_CHANNEL\_x. Therefore, it has to be compared with parts of literals LL\_ADC\_CHANNEL\_x or using helper macro  
`_LL_ADC_CHANNEL_TO_DECIMAL_NB()`. Then the selected literal LL\_ADC\_CHANNEL\_x can be used as parameter for another function. To get the channel number in decimal format: process the returned value with the helper macro `_LL_ADC_CHANNEL_TO_DECIMAL_NB()`.

- (3) On STM32F3, parameter not available on all devices: among others, on STM32F303x8, STM32F328xx.
- (4) On STM32F3, parameter not available on all devices: among others, on STM32F334x8.
- (5) On STM32F3, parameter not available on all devices: among others, on STM32F302xC, STM32F302xE.
- (6) On STM32F3, parameter not available on all devices: among others, on STM32F301x8, STM32F302x8, STM32F318xx.
- (7) On STM32F3, parameter not available on all ADC instances: ADC1, ADC2 (for ADC instances ADCx available on the selected device).
- (8) On STM32F3, parameter not available on all ADC instances: ADC3, ADC4 (for ADC instances ADCx available on the selected device).

**Return values**

- **None**

**Notes**

- On this STM32 serie, setting trigger source to external trigger also set trigger polarity to rising edge (default setting for compatibility with some ADC on other STM32 families having this setting set by HW default value). In case of need to modify trigger edge, use function `LL_ADC_REG_SetTriggerEdge()`.
- Availability of parameters of trigger sources from timer depends on timers availability on the selected device.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on group regular.

- (8) On STM32F3, parameter not available on all ADC instances: ADC3, ADC4 (for ADC instances ADCx available on the selected device).

#### Notes

- To determine whether group regular trigger source is internal (SW start) or external, without detail of which peripheral is selected as external trigger, (equivalent to "if(LL\_ADC\_REG\_GetTriggerSource(ADC1) == LL\_ADC\_REG\_TRIG\_SOFTWARE)" use function LL\_ADC\_REG\_IsTriggerSourceSWStart.
- Availability of parameters of trigger sources from timer depends on timers availability on the selected device.

| Notes                | <ul style="list-style-type: none"> <li>• Description of ADC group regular sequencer features: For devices with sequencer fully configurable (function "LL_ADC_REG_SetSequencerRanks()" available): sequencer length and each rank affection to a channel are configurable. This function performs configuration of:<br/>Sequence length: Number of ranks in the scan sequence.Sequence direction: Unless specified in parameters, sequencer scan direction is forward (from rank 1 to rank n). Sequencer ranks are selected using function "LL_ADC_REG_SetSequencerRanks()". For devices with sequencer not fully configurable (function "LL_ADC_REG_SetSequencerChannels()" available): sequencer length and each rank affection to a channel are defined by channel number. This function performs configuration of:<br/>Sequence length: Number of ranks in the scan sequence is defined by number of channels set in the sequence, rank of each channel is fixed by channel HW number. (channel 0 fixed on rank 0, channel 1 fixed on rank1, ...).Sequence direction: Unless specified in parameters, sequencer scan direction is forward (from lowest channel number to highest channel number). Sequencer ranks are</li> </ul> |

- selected using function "LL\_ADC\_REG\_SetSequencerChannels()".
  - Sequencer disabled is equivalent to sequencer of 1 rank: ADC conversion on only 1 channel.
  - On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on group regular.
- Reference Manual to LL API cross reference:
- SQR1 L LL\_ADC\_REG\_SetSequencerLength

| Notes                | <ul style="list-style-type: none"> <li>• Description of ADC group regular sequencer features: For devices with sequencer fully configurable (function "LL_ADC_REG_SetSequencerRanks()" available): sequencer length and each rank affectation to a channel are configurable. This function retrieves: Sequence length: Number of ranks in the scan sequence. Sequence direction: Unless specified in parameters, sequencer scan direction is forward (from rank 1 to rank n). Sequencer ranks are selected using function "LL_ADC_REG_SetSequencerRanks()". For devices with sequencer not fully configurable (function "LL_ADC_REG_SetSequencerChannels()" available): sequencer length and each rank affectation to a channel are defined by channel number. This function retrieves: Sequence length: Number of ranks in the scan sequence is defined by number of channels set in the sequence, rank of each channel is fixed by channel HW number. (channel 0 fixed on rank 0, channel 1 fixed on rank1, ...). Sequence direction:</li> </ul> |

Reference Manual to  
LL API cross  
reference:

Unless specified in parameters, sequencer scan direction is forward (from lowest channel number to highest channel number). Sequencer ranks are selected using function "LL\_ADC\_REG\_SetSequencerChannels()".

- Sequencer disabled is equivalent to sequencer of 1 rank: ADC conversion on only 1 channel.
- SQR1 L LL\_ADC\_REG\_GetSequencerLength

  - (3) On STM32F3, parameter available only on ADC instance: ADC3.
  - (4) On STM32F3, parameter available only on ADC instances: ADC4.
  - (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to VrefInt at the same time.
- Return values**
- **None**
- Notes**
- This function performs configuration of: Channels ordering into each rank of scan sequence: whatever channel can be placed into whatever rank.
  - On this STM32 serie, ADC group regular sequencer is fully configurable: sequencer length and each rank affection to a channel are configurable. Refer to description of function LL\_ADC\_REG\_SetSequencerLength().
  - Depending on devices and packages, some channels may not be available. Refer to device datasheet for channels availability.
  - On this STM32 serie, to measure internal channels (VrefInt, TempSensor, ...), measurement paths to internal channels must be enabled separately. This can be done using function LL\_ADC\_SetCommonPathInternalCh().
  - On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on group regular.

### **LL\_ADC\_REG\_GetSequencerRanks**

Function name **`__STATIC_INLINE uint32_t LL_ADC_REG_GetSequencerRanks (ADC_TypeDef * ADCx, uint32_t Rank)`**

Function description Get ADC group regular sequence: channel on the selected scan sequence rank.

Parameters

- **ADCx:** ADC instance
- **Rank:** This parameter can be one of the following values:
  - LL\_ADC\_REG\_RANK\_1
  - LL\_ADC\_REG\_RANK\_2
  - LL\_ADC\_REG\_RANK\_3
  - LL\_ADC\_REG\_RANK\_4
  - LL\_ADC\_REG\_RANK\_5
  - LL\_ADC\_REG\_RANK\_6
  - LL\_ADC\_REG\_RANK\_7
  - LL\_ADC\_REG\_RANK\_8
  - LL\_ADC\_REG\_RANK\_9
  - LL\_ADC\_REG\_RANK\_10
  - LL\_ADC\_REG\_RANK\_11
  - LL\_ADC\_REG\_RANK\_12
  - LL\_ADC\_REG\_RANK\_13
  - LL\_ADC\_REG\_RANK\_14
  - LL\_ADC\_REG\_RANK\_15
  - LL\_ADC\_REG\_RANK\_16

Return values

- **Returned:** value can be one of the following values: (1) On STM32F3, parameter available only on ADC instance: ADC1.
  - LL\_ADC\_CHANNEL\_0
  - LL\_ADC\_CHANNEL\_1
  - LL\_ADC\_CHANNEL\_2
  - LL\_ADC\_CHANNEL\_3
  - LL\_ADC\_CHANNEL\_4
  - LL\_ADC\_CHANNEL\_5
  - LL\_ADC\_CHANNEL\_6
  - LL\_ADC\_CHANNEL\_7
  - LL\_ADC\_CHANNEL\_8
  - LL\_ADC\_CHANNEL\_9
  - LL\_ADC\_CHANNEL\_10
  - LL\_ADC\_CHANNEL\_11
  - LL\_ADC\_CHANNEL\_12
  - LL\_ADC\_CHANNEL\_13
  - LL\_ADC\_CHANNEL\_14
  - LL\_ADC\_CHANNEL\_15

- LL\_ADC\_CHANNEL\_16
  - LL\_ADC\_CHANNEL\_17
  - LL\_ADC\_CHANNEL\_18
  - LL\_ADC\_CHANNEL\_VREFINT (5)
  - LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
  - LL\_ADC\_CHANNEL\_VBAT (1)
  - LL\_ADC\_CHANNEL\_VOPAMP1 (1)
  - LL\_ADC\_CHANNEL\_VOPAMP2 (2)
  - LL\_ADC\_CHANNEL\_VOPAMP3 (3)
  - LL\_ADC\_CHANNEL\_VOPAMP4 (4)
  - (2) On STM32F3, parameter available only on ADC instance: ADC2.
  - (3) On STM32F3, parameter available only on ADC instance: ADC3.
  - (4) On STM32F3, parameter available only on ADC instances: ADC4.
  - (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to VrefInt at the same time.
  - (1, 2, 3, 4, 5) For ADC channel read back from ADC register, comparison with internal channel parameter to be done using helper macro  
  \_\_LL\_ADC\_CHANNEL\_INTERNAL\_TO\_EXTERNAL().
- Notes**
- On this STM32 serie, ADC group regular sequencer is fully configurable: sequencer length and each rank affectation to a channel are configurable. Refer to description of function LL\_ADC\_REG\_SetSequencerLength().
  - Depending on devices and packages, some channels may not be available. Refer to device datasheet for channels availability.
  - Usage of the returned channel number: To reinject this channel into another function LL\_ADC\_xxx: the returned channel number is only partly formatted on definition of literals LL\_ADC\_CHANNEL\_x. Therefore, it has to be compared with parts of literals LL\_ADC\_CHANNEL\_x or using helper macro \_\_LL\_ADC\_CHANNEL\_TO\_DECIMAL\_NB(). Then the selected literal LL\_ADC\_CHANNEL\_x can be used as parameter for another function. To get the channel number in decimal format: process the returned value with the helper macro \_\_LL\_ADC\_CHANNEL\_TO\_DECIMAL\_NB().

| Notes                | <ul style="list-style-type: none"> <li>• If transfer by DMA selected, specifies the DMA requests</li> </ul>                                                                                                                                                                              |

mode: Limited mode (One shot mode): DMA transfer requests are stopped when number of DMA data transfers (number of ADC conversions) is reached. This ADC mode is intended to be used with DMA mode non-circular. Unlimited mode: DMA transfer requests are unlimited, whatever number of DMA data transfers (number of ADC conversions). This ADC mode is intended to be used with DMA mode circular.

- If ADC DMA requests mode is set to unlimited and DMA is set to mode non-circular: when DMA transfers size will be reached, DMA will stop transfers of ADC conversions data ADC will raise an overrun error (overrun flag and interruption if enabled).
- For devices with several ADC instances: ADC multimode DMA settings are available using function LL\_ADC\_GetMultiDMATransfer().
- To configure DMA source address (peripheral address), use function LL\_ADC\_DMA\_GetRegAddr().

- (2) On STM32F3, parameter not available on all devices: among others, on STM32F303xC, STM32F358xx.
- (3) On STM32F3, parameter not available on all devices: among others, on STM32F303x8, STM32F328xx.
- (4) On STM32F3, parameter not available on all devices: among others, on STM32F334x8.
- (5) On STM32F3, parameter not available on all devices: among others, on STM32F302xC, STM32F302xE.
- (6) On STM32F3, parameter not available on all devices: among others, on STM32F301x8, STM32F302x8, STM32F318xx.
- (7) On STM32F3, parameter not available on all ADC instances: ADC1, ADC2 (for ADC instances ADCx available on the selected device).
- (8) On STM32F3, parameter not available on all ADC instances: ADC3, ADC4 (for ADC instances ADCx available on the selected device).

#### Return values

- **None**

#### Notes

- On this STM32 serie, setting trigger source to external trigger also set trigger polarity to rising edge (default setting for compatibility with some ADC on other STM32 families having this setting set by HW default value). In case of need to modify trigger edge, use function LL\_ADC\_INJ\_SetTriggerEdge().
- Caution to ADC group injected contexts queue: On this STM32 serie, using successively several times this function will appear has having no effect. This is due to ADC group injected contexts queue (this feature cannot be disabled on this STM32 serie). To set several features of ADC group injected, use function LL\_ADC\_INJ\_ConfigQueueContext().
- Availability of parameters of trigger sources from timer depends on timers availability on the selected device.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must not be disabled. Can be enabled with or without conversion on going on either groups regular or

injected.

- (2) On STM32F3, parameter not available on all devices: among others, on STM32F303xC, STM32F358xx.
- (3) On STM32F3, parameter not available on all devices: among others, on STM32F303x8, STM32F328xx.
- (4) On STM32F3, parameter not available on all devices: among others, on STM32F334x8.
- (5) On STM32F3, parameter not available on all devices: among others, on STM32F302xC, STM32F302xE.
- (6) On STM32F3, parameter not available on all devices: among others, on STM32F301x8, STM32F302x8, STM32F318xx.
- (7) On STM32F3, parameter not available on all ADC instances: ADC1, ADC2 (for ADC instances ADCx available on the selected device).
- (8) On STM32F3, parameter not available on all ADC instances: ADC3, ADC4 (for ADC instances ADCx available on the selected device).

#### Notes

- To determine whether group injected trigger source is internal (SW start) or external, without detail of which peripheral is selected as external trigger, (equivalent to "if(LL\_ADC\_INJ\_GetTriggerSource(ADC1) == LL\_ADC\_INJ\_TRIG\_SOFTWARE)" use function LL\_ADC\_INJ\_IsTriggerSourceSWStart.
- Availability of parameters of trigger sources from timer depends on timers availability on the selected device.

| Function description | Set ADC group injected sequence: channel on the selected sequence rank.                                                                                                                                                   |
| Parameters           | <ul style="list-style-type: none"> <li><b>ADCx:</b> ADC instance</li> <li><b>Rank:</b> This parameter can be one of the following values: <ul style="list-style-type: none"> <li>LL_ADC_INJ_RANK_1</li> </ul> </li> </ul> |

- LL\_ADC\_INJ\_RANK\_2
- LL\_ADC\_INJ\_RANK\_3
- LL\_ADC\_INJ\_RANK\_4
- **Channel:** This parameter can be one of the following values:
  - (1) On STM32F3, parameter available only on ADC instance: ADC1.
    - LL\_ADC\_CHANNEL\_0
    - LL\_ADC\_CHANNEL\_1
    - LL\_ADC\_CHANNEL\_2
    - LL\_ADC\_CHANNEL\_3
    - LL\_ADC\_CHANNEL\_4
    - LL\_ADC\_CHANNEL\_5
    - LL\_ADC\_CHANNEL\_6
    - LL\_ADC\_CHANNEL\_7
    - LL\_ADC\_CHANNEL\_8
    - LL\_ADC\_CHANNEL\_9
    - LL\_ADC\_CHANNEL\_10
    - LL\_ADC\_CHANNEL\_11
    - LL\_ADC\_CHANNEL\_12
    - LL\_ADC\_CHANNEL\_13
    - LL\_ADC\_CHANNEL\_14
    - LL\_ADC\_CHANNEL\_15
    - LL\_ADC\_CHANNEL\_16
    - LL\_ADC\_CHANNEL\_17
    - LL\_ADC\_CHANNEL\_18
    - LL\_ADC\_CHANNEL\_VREFINT (5)
    - LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
    - LL\_ADC\_CHANNEL\_VBAT (1)
    - LL\_ADC\_CHANNEL\_VOPAMP1 (1)
    - LL\_ADC\_CHANNEL\_VOPAMP2 (2)
    - LL\_ADC\_CHANNEL\_VOPAMP3 (3)
    - LL\_ADC\_CHANNEL\_VOPAMP4 (4)
  - (2) On STM32F3, parameter available only on ADC instance: ADC2.
  - (3) On STM32F3, parameter available only on ADC instance: ADC3.
  - (4) On STM32F3, parameter available only on ADC instances: ADC4.
  - (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to VrefInt at the same time.

**Return values****Notes**

- **None**
- Depending on devices and packages, some channels may not be available. Refer to device datasheet for channels availability.
- On this STM32 serie, to measure internal channels (VrefInt, TempSensor, ...), measurement paths to internal channels must be enabled separately. This can be done using function LL\_ADC\_SetCommonPathInternalCh().
- Caution to ADC group injected contexts queue: On this STM32 serie, using successively several times this function will appear has having no effect. This is due to ADC group

- injected contexts queue (this feature cannot be disabled on this STM32 serie). To set several features of ADC group injected, use function LL\_ADC\_INJ\_ConfigQueueContext().
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must not be disabled. Can be enabled with or without conversion on going on either groups regular or injected.

| Return values        | <ul style="list-style-type: none"> <li>• <b>Returned:</b> value can be one of the following values: (1) On STM32F3, parameter available only on ADC instance: ADC1. <ul style="list-style-type: none"> <li>– LL_ADC_CHANNEL_0</li> <li>– LL_ADC_CHANNEL_1</li> <li>– LL_ADC_CHANNEL_2</li> <li>– LL_ADC_CHANNEL_3</li> <li>– LL_ADC_CHANNEL_4</li> <li>– LL_ADC_CHANNEL_5</li> <li>– LL_ADC_CHANNEL_6</li> <li>– LL_ADC_CHANNEL_7</li> <li>– LL_ADC_CHANNEL_8</li> <li>– LL_ADC_CHANNEL_9</li> <li>– LL_ADC_CHANNEL_10</li> <li>– LL_ADC_CHANNEL_11</li> <li>– LL_ADC_CHANNEL_12</li> <li>– LL_ADC_CHANNEL_13</li> <li>– LL_ADC_CHANNEL_14</li> <li>– LL_ADC_CHANNEL_15</li> <li>– LL_ADC_CHANNEL_16</li> <li>– LL_ADC_CHANNEL_17</li> <li>– LL_ADC_CHANNEL_18</li> <li>– LL_ADC_CHANNEL_VREFINT (5)</li> <li>– LL_ADC_CHANNEL_TEMPSENSOR (1)</li> <li>– LL_ADC_CHANNEL_VBAT (1)</li> <li>– LL_ADC_CHANNEL_VOPAMP1 (1)</li> <li>– LL_ADC_CHANNEL_VOPAMP2 (2)</li> <li>– LL_ADC_CHANNEL_VOPAMP3 (3)</li> </ul> </li> </ul> |

- LL\_ADC\_CHANNEL\_VOPAMP4 (4)
  - (2) On STM32F3, parameter available only on ADC instance: ADC2.
  - (3) On STM32F3, parameter available only on ADC instance: ADC3.
  - (4) On STM32F3, parameter available only on ADC instances: ADC4.
  - (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to VrefInt at the same time.
  - (1, 2, 3, 4, 5) For ADC channel read back from ADC register, comparison with internal channel parameter to be done using helper macro `__LL_ADC_CHANNEL_INTERNAL_TO_EXTERNAL()`.
- Notes**
- Depending on devices and packages, some channels may not be available. Refer to device datasheet for channels availability.
  - Usage of the returned channel number: To reinject this channel into another function LL\_ADC\_xxx: the returned channel number is only partly formatted on definition of literals LL\_ADC\_CHANNEL\_x. Therefore, it has to be compared with parts of literals LL\_ADC\_CHANNEL\_x or using helper macro `__LL_ADC_CHANNEL_TO_DECIMAL_NB()`. Then the selected literal LL\_ADC\_CHANNEL\_x can be used as parameter for another function. To get the channel number in decimal format: process the returned value with the helper macro `__LL_ADC_CHANNEL_TO_DECIMAL_NB()`.

| <b>Function description</b> | Set ADC group injected conversion trigger: independent or from ADC group regular.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>           | <ul style="list-style-type: none"> <li>• <b>ADCx:</b> ADC instance</li> <li>• <b>TrigAuto:</b> This parameter can be one of the following values: <ul style="list-style-type: none"> <li>- LL_ADC_INJ_TRIG_INDEPENDENT</li> <li>- LL_ADC_INJ_TRIG_FROM_GRP_REGULAR</li> </ul> </li> </ul>                                                                                                                                                                                    |
| <b>Return values</b>        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Notes</b>                | <ul style="list-style-type: none"> <li>• This mode can be used to extend number of data registers updated after one ADC conversion trigger and with data permanently kept (not erased by successive conversions of scan of ADC sequencer ranks), up to 5 data registers: 1 data register on ADC group regular, 4 data registers on ADC group injected.</li> <li>• If ADC group injected trigger source is set to an external trigger, this feature must be set to</li> </ul> |

independent trigger. ADC group injected automatic trigger is compliant only with group injected trigger source set to SW start, without any further action on ADC group injected conversion start or stop: in this case, ADC group injected is controlled only from ADC group regular.

- It is not possible to enable both ADC group injected auto-injected mode and sequencer discontinuous mode.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on either groups regular or injected.

| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Notes                | <ul style="list-style-type: none"> <li>• A context is a setting of group injected sequencer: group injected triggersequencer lengthsequencer ranks If contexts queue is disabled:only 1 sequence can be configured and is active perpetually. If contexts queue is enabled:up to 2 contexts can be queued and are checked in and out as a FIFO stack (first-in, first-out).If a new context is set when queues is full, error is triggered by interruption "Injected Queue Overflow".Two behaviors are possible when all contexts have been processed: the contexts queue can maintain the last context active perpetually or can be empty and injected group triggers are disabled.Triggers can be only external (not internal)</li> </ul> |

SW start)Caution: The sequence must be fully configured in one time (one write of register JSQR makes a check-in of a new context into the queue). Therefore functions to set separately injected trigger and sequencer channels cannot be used, register JSQR must be set using function LL\_ADC\_INJ\_ConfigQueueContext().

- This parameter can be modified only when no conversion is on going on either groups regular or injected.
- A modification of the context mode (bit JQDIS) causes the contexts queue to be flushed and the register JSQR is cleared.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on either groups regular or injected.

(7)
- (2) On STM32F3, parameter not available on all devices:  
among others, on STM32F303xC, STM32F358xx.
  - (3) On STM32F3, parameter not available on all devices:  
among others, on STM32F303x8, STM32F328xx.
  - (4) On STM32F3, parameter not available on all devices:  
among others, on STM32F334x8.
  - (5) On STM32F3, parameter not available on all devices:  
among others, on STM32F302xC, STM32F302xE.
  - (6) On STM32F3, parameter not available on all devices:  
among others, on STM32F301x8, STM32F302x8,  
STM32F318xx.

- (7) On STM32F3, parameter not available on all ADC instances: ADC1, ADC2 (for ADC instances ADCx available on the selected device).
- (8) On STM32F3, parameter not available on all ADC instances: ADC3, ADC4 (for ADC instances ADCx available on the selected device).
- **ExternalTriggerEdge:** This parameter can be one of the following values: Note: This parameter is discarded in case of SW start: parameter "TriggerSource" set to "LL\_ADC\_INJ\_TRIG\_SOFTWARE".
  - LL\_ADC\_INJ\_TRIG\_EXT\_RISING
  - LL\_ADC\_INJ\_TRIG\_EXT\_FALLING
  - LL\_ADC\_INJ\_TRIG\_EXT\_RISINGFALLING
- **SequencerNbRanks:** This parameter can be one of the following values:
  - LL\_ADC\_INJ\_SEQ\_SCAN\_DISABLE
  - LL\_ADC\_INJ\_SEQ\_SCAN\_ENABLE\_2RANKS
  - LL\_ADC\_INJ\_SEQ\_SCAN\_ENABLE\_3RANKS
  - LL\_ADC\_INJ\_SEQ\_SCAN\_ENABLE\_4RANKS
- **Rank1\_Channel:** This parameter can be one of the following values: (1) On STM32F3, parameter available only on ADC instance: ADC1.
  - LL\_ADC\_CHANNEL\_0
  - LL\_ADC\_CHANNEL\_1
  - LL\_ADC\_CHANNEL\_2
  - LL\_ADC\_CHANNEL\_3
  - LL\_ADC\_CHANNEL\_4
  - LL\_ADC\_CHANNEL\_5
  - LL\_ADC\_CHANNEL\_6
  - LL\_ADC\_CHANNEL\_7
  - LL\_ADC\_CHANNEL\_8
  - LL\_ADC\_CHANNEL\_9
  - LL\_ADC\_CHANNEL\_10
  - LL\_ADC\_CHANNEL\_11
  - LL\_ADC\_CHANNEL\_12
  - LL\_ADC\_CHANNEL\_13
  - LL\_ADC\_CHANNEL\_14
  - LL\_ADC\_CHANNEL\_15
  - LL\_ADC\_CHANNEL\_16
  - LL\_ADC\_CHANNEL\_17
  - LL\_ADC\_CHANNEL\_18
  - LL\_ADC\_CHANNEL\_VREFINT (5)
  - LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
  - LL\_ADC\_CHANNEL\_VBAT (1)
  - LL\_ADC\_CHANNEL\_VOPAMP1 (1)
  - LL\_ADC\_CHANNEL\_VOPAMP2 (2)
  - LL\_ADC\_CHANNEL\_VOPAMP3 (3)
  - LL\_ADC\_CHANNEL\_VOPAMP4 (4)
- (2) On STM32F3, parameter available only on ADC instance: ADC2.
- (3) On STM32F3, parameter available only on ADC instance: ADC3.
- (4) On STM32F3, parameter available only on ADC

- instances: ADC4.
- (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to VrefInt at the same time.
  - **Rank2\_Channel:** This parameter can be one of the following values: (1) On STM32F3, parameter available only on ADC instance: ADC1.
    - LL\_ADC\_CHANNEL\_0
    - LL\_ADC\_CHANNEL\_1
    - LL\_ADC\_CHANNEL\_2
    - LL\_ADC\_CHANNEL\_3
    - LL\_ADC\_CHANNEL\_4
    - LL\_ADC\_CHANNEL\_5
    - LL\_ADC\_CHANNEL\_6
    - LL\_ADC\_CHANNEL\_7
    - LL\_ADC\_CHANNEL\_8
    - LL\_ADC\_CHANNEL\_9
    - LL\_ADC\_CHANNEL\_10

- (2) On STM32F3, parameter available only on ADC instance: ADC2.
- (3) On STM32F3, parameter available only on ADC instance: ADC3.
- (4) On STM32F3, parameter available only on ADC instances: ADC4.
- (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to VrefInt at the same time.
- **SamplingTime:** This parameter can be one of the following values:
  - LL\_ADC\_SAMPLINGTIME\_1CYCLE\_5
  - LL\_ADC\_SAMPLINGTIME\_2CYCLES\_5
  - LL\_ADC\_SAMPLINGTIME\_4CYCLES\_5
  - LL\_ADC\_SAMPLINGTIME\_7CYCLES\_5
  - LL\_ADC\_SAMPLINGTIME\_19CYCLES\_5
  - LL\_ADC\_SAMPLINGTIME\_61CYCLES\_5
  - LL\_ADC\_SAMPLINGTIME\_181CYCLES\_5
  - LL\_ADC\_SAMPLINGTIME\_601CYCLES\_5

## Return values

- **None**

## Notes

- On this device, sampling time is on channel scope: independently of channel mapped on ADC group regular or injected.
- In case of internal channel (VrefInt, TempSensor, ...) to be converted: sampling time constraints must be respected

(sampling time can be adjusted in function of ADC clock frequency and sampling time setting). Refer to device datasheet for timings values (parameters TS\_vrefint, TS\_temp, ...).

- Conversion time is the addition of sampling time and processing time. On this STM32 serie, ADC processing time is: 12.5 ADC clock cycles at ADC resolution 12 bits10.5 ADC clock cycles at ADC resolution 10 bits8.5 ADC clock cycles at ADC resolution 8 bits6.5 ADC clock cycles at ADC resolution 6 bits
- In case of ADC conversion of internal channel (VrefInt, temperature sensor, ...), a sampling time minimum value is required. Refer to device datasheet.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on either groups regular or injected.

  - Conversion time is the addition of sampling time and processing time. On this STM32 serie, ADC processing time is: 12.5 ADC clock cycles at ADC resolution 12 bits10.5 ADC clock cycles at ADC resolution 10 bits8.5 ADC clock cycles at ADC resolution 8 bits6.5 ADC clock cycles at ADC resolution 6 bits

between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically.

- Refer to Reference Manual to ensure the selected channel is available in differential mode. For example, internal channels (VrefInt, TempSensor, ...) are not available in differential mode.
- When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately.
- On STM32F3, channels 16, 17, 18 of ADC1, channels 17, 18 of ADC2, ADC3, ADC4 (if available) are internally fixed to single-ended inputs configuration.
- For ADC channels configured in differential mode, both inputs should be biased at  $(Vref+)/2 \pm 200\text{mV}$ . ( $Vref+$  is the analog voltage reference)
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be ADC disabled.
- One or several values can be selected. Example: (LL\_ADC\_CHANNEL\_4 | LL\_ADC\_CHANNEL\_12 | ...)
- DIFSEL DIFSEL LL\_ADC\_GetChannelSamplingTime

- (1) On STM32F3, parameter available only on ADC instance: ADC1.
- (2) On STM32F3, parameter available only on ADC instance: ADC2.
- (3) On STM32F3, parameter available only on ADC instance: ADC3.
- (4) On STM32F3, parameter available only on ADC instances: ADC4.
- (5) On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to Vrefint at the same time.

**Return values**

- **None**

**Notes**

- Once monitored channels are selected, analog watchdog is enabled.
- In case of need to define a single channel to monitor with analog watchdog from sequencer channel definition, use helper macro `_LL_ADC_ANALOGWD_CHANNEL_GROUP()`.
- On this STM32 serie, there are 2 kinds of analog watchdog instance: AWD standard (instance AWD1): channels monitored: can monitor 1 channel or all channels.groups monitored: ADC groups regular and-or injected.resolution: resolution is not limited (corresponds to ADC resolution configured). AWD flexible (instances AWD2, AWD3): channels monitored: flexible on channels monitored, selection is channel wise, from from 1 to all channels. Specificity of this analog watchdog: Multiple channels can be selected. For example: (`LL_ADC_AWD_CHANNEL4_REG_INJ | LL_ADC_AWD_CHANNEL5_REG_INJ | ...`)groups monitored: not selection possible (monitoring on both groups regular and injected). Channels selected are monitored on groups regular and injected: `LL_ADC_AWD_CHANNELxx_REG_INJ` (do not use parameters `LL_ADC_AWD_CHANNELxx_REG` and `LL_ADC_AWD_CHANNELxx_INJ`)resolution: resolution is limited to 8 bits: if ADC resolution is 12 bits the 4 LSB are

Reference Manual to  
LL API cross  
reference:

- ignored, if ADC resolution is 10 bits the 2 LSB are ignored.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on either groups regular or injected.

#### Notes

- Usage of the returned channel number: To reinject this channel into another function LL\_ADC\_xxx: the returned channel number is only partly formatted on definition of literals LL\_ADC\_CHANNEL\_x. Therefore, it has to be compared with parts of literals LL\_ADC\_CHANNEL\_x or using helper macro \_\_LL\_ADC\_CHANNEL\_TO\_DECIMAL\_NB(). Then the selected literal LL\_ADC\_CHANNEL\_x can be used as parameter for another function. To get the channel number in decimal format: process the returned value with the helper macro \_\_LL\_ADC\_CHANNEL\_TO\_DECIMAL\_NB(). Applicable only when the analog watchdog is set to monitor one channel.
- On this STM32 serie, there are 2 kinds of analog watchdog

instance: AWD standard (instance AWD1): channels monitored: can monitor 1 channel or all channels.groups monitored: ADC groups regular and-or injected.resolution: resolution is not limited (corresponds to ADC resolution configured). AWD flexible (instances AWD2, AWD3): channels monitored: flexible on channels monitored, selection is channel wise, from from 1 to all channels. Specificity of this analog watchdog: Multiple channels can be selected. For example: (LL\_ADC\_AWD\_CHANNEL4\_REG\_INJ | LL\_ADC\_AWD\_CHANNEL5\_REG\_INJ | ...)groups monitored: not selection possible (monitoring on both groups regular and injected). Channels selected are monitored on groups regular and injected: LL\_ADC\_AWD\_CHANNELxx\_REG\_INJ (do not use parameters LL\_ADC\_AWD\_CHANNELxx\_REG and LL\_ADC\_AWD\_CHANNELxx\_INJ)resolution: resolution is limited to 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored.

- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on either groups regular or injected.

N().

- On this STM32 serie, there are 2 kinds of analog watchdog instance: AWD standard (instance AWD1): channels monitored: can monitor 1 channel or all channels.groups monitored: ADC groups regular and-or injected.resolution: resolution is not limited (corresponds to ADC resolution configured). AWD flexible (instances AWD2, AWD3): channels monitored: flexible on channels monitored, selection is channel wise, from from 1 to all channels. Specificity of this analog watchdog: Multiple channels can be selected. For example: (LL\_ADC\_AWD\_CHANNEL4\_REG\_INJ | LL\_ADC\_AWD\_CHANNEL5\_REG\_INJ | ...)groups monitored: not selection possible (monitoring on both groups regular and injected). Channels selected are monitored on groups regular and injected: LL\_ADC\_AWD\_CHANNELxx\_REG\_INJ (do not use parameters LL\_ADC\_AWD\_CHANNELxx\_REG and LL\_ADC\_AWD\_CHANNELxx\_INJ)resolution: resolution is limited to 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored.
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be disabled or enabled without conversion on going on either groups regular or injected.

### **LL\_ADC\_SetMultimode**

Function name

`__STATIC_INLINE void LL_ADC_SetMultimode(ADC_Common_TypeDef * ADCxy_COMMON, uint32_t Multimode)`

Function description

Set ADC multimode configuration to operate in independent mode or multimode (for devices with several ADC instances).

Parameters

- **ADCxy\_COMMON:** ADC common instance (can be set directly from CMSIS definition or by using helper macro `__LL_ADC_COMMON_INSTANCE()`)
- **Multimode:** This parameter can be one of the following values:
  - `LL_ADC_MULTI_INDEPENDENT`
  - `LL_ADC_MULTI_DUAL_REG_SIMULT`
  - `LL_ADC_MULTI_DUAL_REG_INTERL`
  - `LL_ADC_MULTI_DUAL_INJ_SIMULT`
  - `LL_ADC_MULTI_DUAL_INJ_ALTERN`
  - `LL_ADC_MULTI_DUAL_REG_SIM_INJ_SIM`
  - `LL_ADC_MULTI_DUAL_REG_SIM_INJ_ALT`
  - `LL_ADC_MULTI_DUAL_REG_INT_INJ_SIM`

Return values

- **None**

Notes

- If multimode configuration: the selected ADC instance is either master or slave depending on hardware. Refer to reference manual.
- On this STM32 serie, setting of this feature is conditioned to ADC state: All ADC instances of the ADC common group must be disabled. This check can be done with function `LL_ADC_IsEnabled()` for each ADC instance or by using helper macro `__LL_ADC_IS_ENABLED_ALL_COMMON_INSTANCE()`.
- CCR DUAL LL\_ADC\_SetMultimode

| Notes                | <ul style="list-style-type: none"> <li>• If ADC multimode transfer by DMA is not selected: each ADC uses its own DMA channel, with its individual DMA transfer settings. If ADC multimode transfer by DMA is selected: One DMA channel is used for both ADC (DMA of ADC master) Specifies the DMA requests mode: Limited mode (One shot mode): DMA transfer requests are stopped when number of DMA data transfers (number of ADC conversions) is reached.</li> </ul>                                                                                                                                                                            |

This ADC mode is intended to be used with DMA mode non-circular.Unlimited mode: DMA transfer requests are unlimited, whatever number of DMA data transfers (number of ADC conversions). This ADC mode is intended to be used with DMA mode circular.

- If ADC DMA requests mode is set to unlimited and DMA is set to mode non-circular: when DMA transfers size will be reached, DMA will stop transfers of ADC conversions data ADC will raise an overrun error (overrun flag and interruption if enabled).
- How to retrieve multimode conversion data: Whatever multimode transfer by DMA setting: using function LL\_ADC\_REG\_ReadMultiConversionData32(). If ADC multimode transfer by DMA is selected: conversion data is a raw data with ADC master and slave concatenated. A macro is available to get the conversion data of ADC master or ADC slave: see helper macro \_\_LL\_ADC\_MULTI\_CONV\_DATA\_MASTER\_SLAVE().
- On this STM32 serie, setting of this feature is conditioned to ADC state: All ADC instances of the ADC common group must be disabled or enabled without conversion on going on group regular.

### **LL\_ADC\_GetMultiDMATransfer**

Function name **STATIC\_INLINE uint32\_t LL\_ADC\_GetMultiDMATransfer(ADC\_Common\_TypeDef \* ADCxy\_COMMON)**

Function description Get ADC multimode conversion data transfer: no transfer or transfer by DMA.

Parameters **ADCxy\_COMMON:** ADC common instance (can be set directly from CMSIS definition or by using helper macro \_\_LL\_ADC\_COMMON\_INSTANCE() )

Return values **Returned:** value can be one of the following values:

- LL\_ADC\_MULTI\_REG\_DMA\_EACH\_ADC
- LL\_ADC\_MULTI\_REG\_DMA\_LIMIT\_RES12\_10B
- LL\_ADC\_MULTI\_REG\_DMA\_LIMIT\_RES8\_6B
- LL\_ADC\_MULTI\_REG\_DMA\_UNLMT\_RES12\_10B
- LL\_ADC\_MULTI\_REG\_DMA\_UNLMT\_RES8\_6B

Notes • If ADC multimode transfer by DMA is not selected: each ADC uses its own DMA channel, with its individual DMA transfer settings. If ADC multimode transfer by DMA is selected: One DMA channel is used for both ADC (DMA of ADC master) Specifies the DMA requests mode: Limited mode (One shot mode): DMA transfer requests are stopped when number of DMA data transfers (number of ADC conversions) is reached. This ADC mode is intended to be used with DMA mode non-circular.Unlimited mode: DMA transfer requests are unlimited, whatever number of DMA data transfers (number of ADC conversions). This ADC mode is intended to be used with

- DMA mode circular.
- If ADC DMA requests mode is set to unlimited and DMA is set to mode non-circular: when DMA transfers size will be reached, DMA will stop transfers of ADC conversions data ADC will raise an overrun error (overrun flag and interruption if enabled).
- How to retrieve multimode conversion data: Whatever multimode transfer by DMA setting: using function LL\_ADC\_REG\_ReadMultiConversionData32(). If ADC multimode transfer by DMA is selected: conversion data is a raw data with ADC master and slave concatenated. A macro is available to get the conversion data of ADC master or ADC slave: see helper macro \_\_LL\_ADC\_MULTI\_CONV\_DATA\_MASTER\_SLAVE().

| Notes                | <ul style="list-style-type: none"> <li>The sampling delay range depends on ADC resolution: ADC resolution 12 bits can have maximum delay of 12 cycles. ADC resolution 10 bits can have maximum delay of 10 cycles. ADC resolution 8 bits can have maximum delay of 8 cycles. ADC resolution 6 bits can have maximum delay of 6 cycles.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Reference Manual to  
LL API cross  
reference:

- On this STM32 serie, setting of this feature is conditioned to ADC state: All ADC instances of the ADC common group must be disabled. This check can be done with function LL\_ADC\_IsEnabled() for each ADC instance or by using helper macro helper macro \_\_LL\_ADC\_IS\_ENABLED\_ALL\_COMMON\_INSTANCE().
- CCR DELAY LL\_ADC\_SetMultiTwoSamplingDelay

### LL\_ADC\_StartCalibration

Function name

`_STATIC_INLINE void LL_ADC_StartCalibration  
(ADC_TypeDef * ADCx, uint32_t SingleDiff)`

Function description

Start ADC calibration in the mode single-ended or differential (for devices with differential mode available).

Parameters

- **ADCx:** ADC instance
- **SingleDiff:** This parameter can be one of the following values:
  - LL\_ADC\_SINGLE\_ENDED
  - LL\_ADC\_DIFFERENTIAL\_ENDED

Return values

- **None**

Notes

- On this STM32 serie, a minimum number of ADC clock cycles are required between ADC end of calibration and ADC enable. Refer to literal `LL_ADC_DELAY_CALIB_ENABLE_ADC_CYCLES`.
- For devices with differential mode available: Calibration of offset is specific to each of single-ended and differential modes (calibration run must be performed for each of these differential modes, if used afterwards and if the application requires their calibration).
- On this STM32 serie, setting of this feature is conditioned to ADC state: ADC must be ADC disabled.

### LL\_ADC\_IsCalibrationOnGoing

Function name

`_STATIC_INLINE uint32_t LL_ADC_IsCalibrationOnGoing  
(ADC_TypeDef * ADCx)`

Function description

Get ADC calibration state.

Parameters

- **ADCx:** ADC instance

Return values

- **0:** calibration complete, 1: calibration in progress.

Reference Manual to  
LL API cross  
reference:

- CR ADCAL LL\_ADC\_IsCalibrationOnGoing

### LL\_ADC\_REG\_StartConversion

Function name

`_STATIC_INLINE void LL_ADC_REG_StartConversion  
(ADC_TypeDef * ADCx)`

Function description

Start ADC group regular conversion.

Parameters

- **ADCx:** ADC instance

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Function name            **\_STATIC\_INLINE uint32\_t LL\_ADC\_IsActiveFlag\_JEOS(ADC\_TypeDef \* ADCx)**

Function description     Get flag ADC group injected end of sequence conversions.

Parameters              • **ADCx:** ADC instance

Return values           • **State:** of bit (1 or 0).

Reference Manual to  
LL API cross  
reference:

- ISR JEOS LL\_ADC\_IsActiveFlag\_JEOS

### **LL\_ADC\_IsActiveFlag\_JQOVF**

Function name            **\_STATIC\_INLINE uint32\_t LL\_ADC\_IsActiveFlag\_JQOVF(ADC\_TypeDef \* ADCx)**

Function description     Get flag ADC group injected contexts queue overflow.

Parameters              • **ADCx:** ADC instance

Return values           • **State:** of bit (1 or 0).

Reference Manual to  
LL API cross  
reference:

- ISR JQOVF LL\_ADC\_IsActiveFlag\_JQOVF

### **LL\_ADC\_IsActiveFlag\_AWD1**

Function name      **`_STATIC_INLINE uint32_t LL_ADC_IsActiveFlag_AWD1(ADC_TypeDef * ADCx)`**

Function description      Get flag ADC analog watchdog 1 flag.

Parameters      • **ADCx:** ADC instance

Return values      • **State:** of bit (1 or 0).

Reference Manual to  
LL API cross  
reference:

- ISR AWD1 LL\_ADC\_IsActiveFlag\_AWD1

### **LL\_ADC\_IsActiveFlag\_AWD2**

Function name      **`_STATIC_INLINE uint32_t LL_ADC_IsActiveFlag_AWD2(ADC_TypeDef * ADCx)`**

Function description      Get flag ADC analog watchdog 2.

Parameters      • **ADCx:** ADC instance

Return values      • **State:** of bit (1 or 0).

Reference Manual to  
LL API cross  
reference:

- ISR AWD2 LL\_ADC\_IsActiveFlag\_AWD2

### **LL\_ADC\_IsActiveFlag\_AWD3**

Function name      **`_STATIC_INLINE uint32_t LL_ADC_IsActiveFlag_AWD3(ADC_TypeDef * ADCx)`**

Function description      Get flag ADC analog watchdog 3.

Parameters      • **ADCx:** ADC instance

Return values      • **State:** of bit (1 or 0).

Reference Manual to  
LL API cross  
reference:

- ISR AWD3 LL\_ADC\_IsActiveFlag\_AWD3

### **LL\_ADC\_ClearFlag\_ADRDY**

Function name      **`_STATIC_INLINE void LL_ADC_ClearFlag_ADRDY(ADC_TypeDef * ADCx)`**

Function description      Clear flag ADC ready.

Parameters      • **ADCx:** ADC instance

Return values      • **None**

Notes      • On this STM32 serie, flag LL\_ADC\_FLAG\_ADRDY is raised when the ADC is enabled and when conversion clock is

active. (not only core clock: this ADC has a dual clock domain)

Reference Manual to  
LL API cross  
reference:

### **LL\_ADC\_ClearFlag\_EOC**

Function name      **\_STATIC\_INLINE void LL\_ADC\_ClearFlag\_EOC(ADC\_TypeDef \* ADCx)**

Function description      Clear flag ADC group regular end of unitary conversion.

Parameters      • **ADCx:** ADC instance

Return values      • **None**

Reference Manual to  
LL API cross  
reference:

- ISR EOC LL\_ADC\_ClearFlag\_EOC

### **LL\_ADC\_ClearFlag\_EOS**

Function name      **\_STATIC\_INLINE void LL\_ADC\_ClearFlag\_EOS(ADC\_TypeDef \* ADCx)**

Function description      Clear flag ADC group regular end of sequence conversions.

Parameters      • **ADCx:** ADC instance

Return values      • **None**

Reference Manual to  
LL API cross  
reference:

- ISR EOS LL\_ADC\_ClearFlag\_EOS

### **LL\_ADC\_ClearFlag\_OVR**

Function name      **\_STATIC\_INLINE void LL\_ADC\_ClearFlag\_OVR(ADC\_TypeDef \* ADCx)**

Function description      Clear flag ADC group regular overrun.

Parameters      • **ADCx:** ADC instance

Return values      • **None**

Reference Manual to  
LL API cross  
reference:

- ISR OVR LL\_ADC\_ClearFlag\_OVR

### **LL\_ADC\_ClearFlag\_EOSMP**

Function name      **\_STATIC\_INLINE void LL\_ADC\_ClearFlag\_EOSMP(ADC\_TypeDef \* ADCx)**

Function description      Clear flag ADC group regular end of sampling phase.

Parameters      • **ADCx:** ADC instance

**LL\_ADC\_DisableIT\_AWD3**

Function name **`_STATIC_INLINE void LL_ADC_DisableIT_AWD3(ADC_TypeDef * ADCx)`**

Function description Disable interruption ADC analog watchdog 3.

Parameters • **ADCx:** ADC instance

Return values • **None**

Reference Manual to  
LL API cross  
reference:  
IER AWD3IE LL\_ADC\_DisableIT\_AWD3

**LL\_ADC\_IsEnabledIT\_ADRDY**

Function name **`_STATIC_INLINE uint32_t LL_ADC_IsEnabledIT_ADRDY(ADC_TypeDef * ADCx)`**

Function description Get state of interruption ADC ready (0: interrupt disabled, 1: interrupt enabled).

Parameters • **ADCx:** ADC instance

Return values • **State:** of bit (1 or 0).

Reference Manual to  
LL API cross  
reference:  
IER ADRDYIE LL\_ADC\_IsEnabledIT\_ADRDY

**LL\_ADC\_IsEnabledIT\_EOC**

Function name **`_STATIC_INLINE uint32_t LL_ADC_IsEnabledIT_EOC(ADC_TypeDef * ADCx)`**

Function description Get state of interruption ADC group regular end of unitary conversion (0: interrupt disabled, 1: interrupt enabled).

Parameters • **ADCx:** ADC instance

Return values • **State:** of bit (1 or 0).

Reference Manual to  
LL API cross  
reference:  
IER EOCIE LL\_ADC\_IsEnabledIT\_EOC

**LL\_ADC\_IsEnabledIT\_EOS**

Function name **`_STATIC_INLINE uint32_t LL_ADC_IsEnabledIT_EOS(ADC_TypeDef * ADCx)`**

Function description Get state of interruption ADC group regular end of sequence conversions (0: interrupt disabled, 1: interrupt enabled).

Parameters • **ADCx:** ADC instance

Return values • **State:** of bit (1 or 0).

| Notes                | <ul style="list-style-type: none"> <li>These parameters have an impact on ADC scope: ADC instance. Affects both group regular and group injected (availability of ADC group injected depends on STM32 families). Refer to corresponding unitary functions into Configuration of ADC hierarchical scope: ADC instance .</li> <li>The setting of these parameters by function LL_ADC_Init() is conditioned to ADC state: ADC instance must be disabled. This condition is applied to all ADC features, for efficiency and compatibility over all STM32 families. However, the different features can be set under different ADC state conditions (setting possible with ADC enabled without conversion on going, ADC enabled with conversion on going, ...) Each feature can be updated afterwards with a unitary function and potentially with ADC in a different state than disabled, refer to description of each function for setting conditioned to ADC state.</li> </ul> |

- After using this function, some other features must be configured using LL unitary functions. The minimum configuration remaining to be done is: Set ADC group regular or group injected sequencer: map channel on the selected sequencer rank. Refer to function `LL_ADC_REG_SetSequencerRanks()`. Set ADC channel sampling time Refer to function `LL_ADC_SetChannelSamplingTime();`

| Notes                | <ul style="list-style-type: none"> <li>• These parameters have an impact on ADC scope: ADC group regular. Refer to corresponding unitary functions into Configuration of ADC hierarchical scope: group regular (functions with prefix "REG").</li> <li>• The setting of these parameters by function <code>LL_ADC_Init()</code> is conditioned to ADC state: ADC instance must be disabled. This condition is applied to all ADC features, for efficiency and compatibility over all STM32 families. However, the different features can be set under different ADC state conditions (setting possible with ADC enabled without conversion on going, ADC enabled with conversion on going, ...) Each feature can be updated afterwards with a unitary function and potentially with ADC in a different state than disabled, refer to description of each function for setting conditioned to ADC state.</li> <li>• After using this function, other features must be configured using LL unitary functions. The minimum configuration remaining to be done is: Set ADC group regular or group injected sequencer: map channel on the selected sequencer rank. Refer to function <code>LL_ADC_REG_SetSequencerRanks()</code>. Set ADC channel sampling time Refer to function <code>LL_ADC_SetChannelSamplingTime();</code></li> </ul> |

---

```
LL_ADC_SetChannelSamplingTime();
```

| Notes                | <ul style="list-style-type: none"> <li>• These parameters have an impact on ADC scope: ADC group injected. Refer to corresponding unitary functions into Configuration of ADC hierarchical scope: group regular (functions with prefix "INJ").</li> <li>• The setting of these parameters by function LL_ADC_Init() is conditioned to ADC state: ADC instance must be disabled. This condition is applied to all ADC features, for efficiency and compatibility over all STM32 families. However, the different features can be set under different ADC state conditions (setting possible with ADC enabled without conversion on going, ADC enabled with conversion on going, ...) Each feature can be updated afterwards with a unitary function and potentially with ADC in a different state than disabled, refer to description of each function for setting conditioned to ADC state.</li> <li>• After using this function, other features must be configured using LL unitary functions. The minimum configuration remaining to be done is: Set ADC group injected sequencer: map channel on the selected sequencer rank. Refer to function LL_ADC_INJ_SetSequencerRanks(). Set ADC channel sampling time Refer to function LL_ADC_SetChannelSamplingTime();</li> <li>• Caution to ADC group injected contexts queue: On this STM32 serie, using successively several times this function will appear has having no effect. This is due to ADC group injected contexts queue (this feature cannot be disabled on this STM32 serie). To set several features of ADC group</li> </ul> |

injected, use function LL\_ADC\_INJ\_ConfigQueueContext().

### **LL\_ADC\_INJ\_StructInit**

|                      |                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void LL_ADC_INJ_StructInit (LL_ADC_INJ_InitTypeDef *<br/>ADC_INJ_InitStruct)</b>                                                                                      |
| Function description | Set each LL_ADC_INJ_InitTypeDef field to default value.                                                                                                                  |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>ADC_INJ_InitStruct:</b> Pointer to a LL_ADC_INJ_InitTypeDef structure whose fields will be set to default values.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                          |

## 59.3 ADC Firmware driver defines

### 59.3.1 ADC

#### *Analog watchdog - Monitored channels*

|                                 |                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| LL_ADC_AWD_DISABLE              | ADC analog watchdog monitoring disabled                                                                                                        |
| LL_ADC_AWD_ALL_CHANNELS_REG     | ADC analog watchdog monitoring of all channels, converted by group regular only                                                                |
| LL_ADC_AWD_ALL_CHANNELS_INJ     | ADC analog watchdog monitoring of all channels, converted by group injected only                                                               |

| LL_ADC_AWD_CHANNEL_18_REG     | ADC analog watchdog monitoring of ADC external channel (channel connected to GPIO pin) ADCx_IN18, converted by group regular only                      |
| LL_ADC_AWD_CHANNEL_18_INJ     | ADC analog watchdog monitoring of ADC external channel (channel connected to GPIO pin) ADCx_IN18, converted by group injected only                     |
| LL_ADC_AWD_CHANNEL_18_REG_INJ | ADC analog watchdog monitoring of ADC external channel (channel connected to GPIO pin) ADCx_IN18, converted by either group regular or injected        |
| LL_ADC_AWD_CH_VREFINT_REG     | ADC analog watchdog monitoring of ADC internal channel connected to VrefInt: Internal voltage reference, converted by group regular only               |
| LL_ADC_AWD_CH_VREFINT_INJ     | ADC analog watchdog monitoring of ADC internal channel connected to VrefInt: Internal voltage reference, converted by group injected only              |
| LL_ADC_AWD_CH_VREFINT_REG_INJ | ADC analog watchdog monitoring of ADC internal channel connected to VrefInt: Internal voltage reference, converted by either group regular or injected |
| LL_ADC_AWD_CH_TEMPSENSOR_REG  | ADC analog watchdog monitoring of ADC internal channel connected to Temperature sensor, converted by group regular only                                |
| LL_ADC_AWD_CH_TEMPSENSOR_INJ  | ADC analog watchdog monitoring of ADC internal channel connected to Temperature sensor, converted by group injected only                               |

|                                  |                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LL_ADC_AWD_CH_TEMPSENSOR_REG_INJ | ADC analog watchdog monitoring of ADC internal channel connected to Temperature sensor, converted by either group regular or injected                                                            |
| LL_ADC_AWD_CH_VBAT_REG           | ADC analog watchdog monitoring of ADC internal channel connected to Vbat/3: Vbat voltage through a divider ladder of factor 1/3 to have Vbat always below Vdda, converted by group regular only  |
| LL_ADC_AWD_CH_VBAT_INJ           | ADC analog watchdog monitoring of ADC internal channel connected to Vbat/3: Vbat voltage through a divider ladder of factor 1/3 to have Vbat always below Vdda, converted by group injected only |
| LL_ADC_AWD_CH_VBAT_REG_INJ       | ADC analog watchdog monitoring of ADC internal channel connected to Vbat/3: Vbat voltage through a divider ladder of factor 1/3 to have Vbat always below Vdda                                   |
| LL_ADC_AWD_CH_VOPAMP1_REG        | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC2, converted by group regular only                                                    |
| LL_ADC_AWD_CH_VOPAMP1_INJ        | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC2, converted by group injected only                                                   |
| LL_ADC_AWD_CH_VOPAMP1_REG_INJ    | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC2, converted by either group regular or injected                                      |
| LL_ADC_AWD_CH_VOPAMP2_REG        | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC2, converted by group regular only                                                    |
| LL_ADC_AWD_CH_VOPAMP2_INJ        | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC2, converted by group injected only                                                   |
| LL_ADC_AWD_CH_VOPAMP2_REG_INJ    | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC2, converted by either group regular or injected                                      |
| LL_ADC_AWD_CH_VOPAMP3_REG        | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to                                                                                          |

|                               |                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | ADC3, converted by group regular only                                                                                                                       |
| LL_ADC_AWD_CH_VOPAMP3_INJ     | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC3, converted by group injected only              |
| LL_ADC_AWD_CH_VOPAMP3_REG_INJ | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC3, converted by either group regular or injected |
| LL_ADC_AWD_CH_VOPAMP4_REG     | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC3, converted by group regular only               |
| LL_ADC_AWD_CH_VOPAMP4_INJ     | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC3, converted by group injected only              |
| LL_ADC_AWD_CH_VOPAMP4_REG_INJ | ADC analog watchdog monitoring of ADC internal channel connected to DAC1 channel 1, channel specific to ADC3, converted by either group regular or injected |

#### **Analog watchdog - Analog watchdog number**

|             |                              |
|-------------|------------------------------|
| LL_ADC_AWD1 | ADC analog watchdog number 1 |
| LL_ADC_AWD2 | ADC analog watchdog number 2 |
| LL_ADC_AWD3 | ADC analog watchdog number 3 |

#### **Analog watchdog - Thresholds**

|                                |                                                                                  |
|--------------------------------|----------------------------------------------------------------------------------|
| LL_ADC_AWD_THRESHOLD_HIGH      | ADC analog watchdog threshold high                                               |
| LL_ADC_AWD_THRESHOLD_LOW       | ADC analog watchdog threshold low                                                |
| LL_ADC_AWD_THRESHOLDS_HIGH_LOW | ADC analog watchdog both thresholds high and low concatenated into the same data |

#### **ADC instance - Channel number**

|                  |                                                               |
|------------------|---------------------------------------------------------------|
| LL_ADC_CHANNEL_0 | ADC external channel (channel connected to GPIO pin) ADCx_IN0 |
| LL_ADC_CHANNEL_1 | ADC external channel (channel connected to GPIO pin) ADCx_IN1 |
| LL_ADC_CHANNEL_2 | ADC external channel (channel connected to GPIO pin) ADCx_IN2 |
| LL_ADC_CHANNEL_3 | ADC external channel (channel connected to GPIO pin) ADCx_IN3 |
| LL_ADC_CHANNEL_4 | ADC external channel (channel connected to GPIO pin) ADCx_IN4 |
| LL_ADC_CHANNEL_5 | ADC external channel (channel connected to GPIO pin) ADCx_IN5 |

|                           |                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LL_ADC_CHANNEL_6          | ADC external channel (channel connected to GPIO pin) ADCx_IN6                                                                                                                                                         |
| LL_ADC_CHANNEL_7          | ADC external channel (channel connected to GPIO pin) ADCx_IN7                                                                                                                                                         |
| LL_ADC_CHANNEL_8          | ADC external channel (channel connected to GPIO pin) ADCx_IN8                                                                                                                                                         |
| LL_ADC_CHANNEL_9          | ADC external channel (channel connected to GPIO pin) ADCx_IN9                                                                                                                                                         |
| LL_ADC_CHANNEL_10         | ADC external channel (channel connected to GPIO pin) ADCx_IN10                                                                                                                                                        |
| LL_ADC_CHANNEL_11         | ADC external channel (channel connected to GPIO pin) ADCx_IN11                                                                                                                                                        |
| LL_ADC_CHANNEL_12         | ADC external channel (channel connected to GPIO pin) ADCx_IN12                                                                                                                                                        |
| LL_ADC_CHANNEL_13         | ADC external channel (channel connected to GPIO pin) ADCx_IN13                                                                                                                                                        |
| LL_ADC_CHANNEL_14         | ADC external channel (channel connected to GPIO pin) ADCx_IN14                                                                                                                                                        |
| LL_ADC_CHANNEL_15         | ADC external channel (channel connected to GPIO pin) ADCx_IN15                                                                                                                                                        |
| LL_ADC_CHANNEL_16         | ADC external channel (channel connected to GPIO pin) ADCx_IN16                                                                                                                                                        |
| LL_ADC_CHANNEL_17         | ADC external channel (channel connected to GPIO pin) ADCx_IN17                                                                                                                                                        |
| LL_ADC_CHANNEL_18         | ADC external channel (channel connected to GPIO pin) ADCx_IN18                                                                                                                                                        |
| LL_ADC_CHANNEL_VREFINT    | ADC internal channel connected to VrefInt: Internal voltage reference. On STM32F3, ADC channel available only on all ADC instances, but only one ADC instance is allowed to be connected to VrefInt at the same time. |
| LL_ADC_CHANNEL_TEMPSENSOR | ADC internal channel connected to Temperature sensor. On STM32F3, ADC channel available only on ADC instance: ADC1.                                                                                                   |
| LL_ADC_CHANNEL_VBAT       | ADC internal channel connected to Vbat/3: Vbat voltage through a divider ladder of factor 1/3 to have Vbat always below Vdda. On STM32F3, ADC channel available only on ADC instance: ADC1.                           |
| LL_ADC_CHANNEL_VOPAMP1    | ADC internal channel connected to OPAMP1 output. On STM32F3, ADC channel available only on ADC instance: ADC1.                                                                                                        |
| LL_ADC_CHANNEL_VOPAMP2    | ADC internal channel connected to OPAMP2 output. On STM32F3, ADC channel available only on ADC instance: ADC2.                                                                                                        |
| LL_ADC_CHANNEL_VOPAMP3    | ADC internal channel connected to OPAMP3 output. On STM32F3, ADC channel available only                                                                                                                               |

on ADC instance: ADC3.

`LL_ADC_CHANNEL_VOPAMP4` ADC internal channel connected to OPAMP4 output. On STM32F3, ADC channel available only on ADC instance: ADC4.

#### ***Channel - Sampling time***

|                                              |                                      |
|----------------------------------------------|--------------------------------------|
| <code>LL_ADC_SAMPLINGTIME_1CYCLE_5</code>    | Sampling time 1.5 ADC clock cycle    |
| <code>LL_ADC_SAMPLINGTIME_2CYCLES_5</code>   | Sampling time 2.5 ADC clock cycles   |
| <code>LL_ADC_SAMPLINGTIME_4CYCLES_5</code>   | Sampling time 4.5 ADC clock cycles   |
| <code>LL_ADC_SAMPLINGTIME_7CYCLES_5</code>   | Sampling time 7.5 ADC clock cycles   |
| <code>LL_ADC_SAMPLINGTIME_19CYCLES_5</code>  | Sampling time 19.5 ADC clock cycles  |
| <code>LL_ADC_SAMPLINGTIME_61CYCLES_5</code>  | Sampling time 61.5 ADC clock cycles  |
| <code>LL_ADC_SAMPLINGTIME_181CYCLES_5</code> | Sampling time 181.5 ADC clock cycles |
| <code>LL_ADC_SAMPLINGTIME_601CYCLES_5</code> | Sampling time 601.5 ADC clock cycles |

#### ***Channel - Single or differential ending***

|                                            |                                                                                                             |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <code>LL_ADC_SINGLE_ENDED</code>           | ADC channel ending set to single ended (literal also used to set calibration mode)                          |
| <code>LL_ADC_DIFFERENTIAL_ENDED</code>     | ADC channel ending set to differential (literal also used to set calibration mode)                          |
| <code>LL_ADC_BOTH_SINGLE_DIFF_ENDED</code> | ADC channel ending set to both single ended and differential (literal used only to set calibration factors) |

#### ***ADC common - Clock source***

|                                          |                                                                           |
|------------------------------------------|---------------------------------------------------------------------------|
| <code>LL_ADC_CLOCK_SYNC_PCLK_DIV1</code> | ADC synchronous clock derived from AHB clock without prescaler            |
| <code>LL_ADC_CLOCK_SYNC_PCLK_DIV2</code> | ADC synchronous clock derived from AHB clock with prescaler division by 2 |
| <code>LL_ADC_CLOCK_SYNC_PCLK_DIV4</code> | ADC synchronous clock derived from AHB clock with prescaler division by 4 |
| <code>LL_ADC_CLOCK_ASYNC_DIV1</code>     | ADC asynchronous clock without prescaler                                  |

#### ***ADC common - Measurement path to internal channels***

|                                              |                                                             |
|----------------------------------------------|-------------------------------------------------------------|
| <code>LL_ADC_PATH_INTERNAL_NONE</code>       | ADC measurement pathes all disabled                         |
| <code>LL_ADC_PATH_INTERNAL_VREFINT</code>    | ADC measurement path to internal channel VrefInt            |
| <code>LL_ADC_PATH_INTERNAL_TEMPSENSOR</code> | ADC measurement path to internal channel temperature sensor |
| <code>LL_ADC_PATH_INTERNAL_VBAT</code>       | ADC measurement path to internal channel Vbat               |

#### ***ADC instance - Data alignment***

|                                      |                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------|
| <code>LL_ADC_DATA_ALIGN_RIGHT</code> | ADC conversion data alignment: right aligned (alignment on data register LSB bit 0) |
| <code>LL_ADC_DATA_ALIGN_LEFT</code>  | ADC conversion data alignment: left aligned (aligment                               |

on data register MSB bit 15)

***ADC flags***

|                       |                                                                          |
|-----------------------|--------------------------------------------------------------------------|
| LL_ADC_FLAG_ADRDY     | ADC flag ADC instance ready                                              |
| LL_ADC_FLAG_EOC       | ADC flag ADC group regular end of unitary conversion                     |
| LL_ADC_FLAG_EOS       | ADC flag ADC group regular end of sequence conversions                   |
| LL_ADC_FLAG_OVR       | ADC flag ADC group regular overrun                                       |
| LL_ADC_FLAG_EOSMP     | ADC flag ADC group regular end of sampling phase                         |
| LL_ADC_FLAG_JEOC      | ADC flag ADC group injected end of unitary conversion                    |
| LL_ADC_FLAG_JEOS      | ADC flag ADC group injected end of sequence conversions                  |
| LL_ADC_FLAG_JQOVF     | ADC flag ADC group injected contexts queue overflow                      |
| LL_ADC_FLAG_AWD1      | ADC flag ADC analog watchdog 1                                           |
| LL_ADC_FLAG_AWD2      | ADC flag ADC analog watchdog 2                                           |
| LL_ADC_FLAG_AWD3      | ADC flag ADC analog watchdog 3                                           |
| LL_ADC_FLAG_ADRDY_MST | ADC flag ADC multimode master instance ready                             |
| LL_ADC_FLAG_ADRDY_SLV | ADC flag ADC multimode slave instance ready                              |
| LL_ADC_FLAG_EOC_MST   | ADC flag ADC multimode master group regular end of unitary conversion    |
| LL_ADC_FLAG_EOC_SLV   | ADC flag ADC multimode slave group regular end of unitary conversion     |
| LL_ADC_FLAG_EOS_MST   | ADC flag ADC multimode master group regular end of sequence conversions  |
| LL_ADC_FLAG_EOS_SLV   | ADC flag ADC multimode slave group regular end of sequence conversions   |
| LL_ADC_FLAG_OVR_MST   | ADC flag ADC multimode master group regular overrun                      |
| LL_ADC_FLAG_OVR_SLV   | ADC flag ADC multimode slave group regular overrun                       |
| LL_ADC_FLAG_EOSMP_MST | ADC flag ADC multimode master group regular end of sampling phase        |
| LL_ADC_FLAG_EOSMP_SLV | ADC flag ADC multimode slave group regular end of sampling phase         |
| LL_ADC_FLAG_JEOC_MST  | ADC flag ADC multimode master group injected end of unitary conversion   |
| LL_ADC_FLAG_JEOC_SLV  | ADC flag ADC multimode slave group injected end of unitary conversion    |
| LL_ADC_FLAG_JEOS_MST  | ADC flag ADC multimode master group injected end of sequence conversions |
| LL_ADC_FLAG_JEOS_SLV  | ADC flag ADC multimode slave group injected end of sequence conversions  |
| LL_ADC_FLAG_JQOVF_MST | ADC flag ADC multimode master group injected contexts queue overflow     |

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| LL_ADC_FLAG_JQOVF_SLV | ADC flag ADC multimode slave group injected contexts queue overflow |
| LL_ADC_FLAG_AWD1_MST  | ADC flag ADC multimode master analog watchdog 1 of the ADC master   |
| LL_ADC_FLAG_AWD1_SLV  | ADC flag ADC multimode slave analog watchdog 1 of the ADC slave     |
| LL_ADC_FLAG_AWD2_MST  | ADC flag ADC multimode master analog watchdog 2 of the ADC master   |
| LL_ADC_FLAG_AWD2_SLV  | ADC flag ADC multimode slave analog watchdog 2 of the ADC slave     |
| LL_ADC_FLAG_AWD3_MST  | ADC flag ADC multimode master analog watchdog 3 of the ADC master   |

| LL_ADC_LP_AUTOWAIT  | ADC low power mode auto delay: Dynamic low power mode, ADC conversions are performed only when necessary (when previous ADC conversion data is read). See description with function |

***Multimode - DMA transfer*****LL\_ADC\_MULTI\_REG\_DMA\_EACH\_ADC**

ADC multimode group regular conversions are transferred by DMA: each ADC uses its own DMA channel, with its individual DMA transfer settings

**LL\_ADC\_MULTI\_REG\_DMA\_LIMIT\_RES12\_10B**

ADC multimode group regular conversions are transferred by DMA, one DMA channel for both ADC (DMA of ADC master), in limited mode (one shot mode): DMA transfer requests are stopped when number of DMA data transfers (number of ADC conversions) is reached. This ADC mode is intended to be used with DMA mode non-circular. Setting for ADC resolution of 12 and 10 bits

**LL\_ADC\_MULTI\_REG\_DMA\_LIMIT\_RES8\_6B**

ADC multimode group regular conversions are transferred by DMA, one DMA channel for both ADC (DMA of ADC master), in limited mode (one shot mode): DMA transfer requests are stopped when number of DMA data transfers (number of ADC conversions) is reached. This ADC mode is intended to be used with DMA mode non-circular. Setting for ADC resolution of 8 and 6 bits

**LL\_ADC\_MULTI\_REG\_DMA\_UNLMT\_RES12\_10B**

ADC multimode group regular conversions are transferred by DMA, one DMA channel for both ADC (DMA of ADC master), in unlimited mode: DMA transfer requests are unlimited, whatever number of DMA data transferred (number of ADC conversions). This ADC mode is intended to be used with DMA mode circular. Setting for ADC resolution of 12 and 10 bits

**LL\_ADC\_MULTI\_REG\_DMA\_UNLMT\_RES8\_6B**

ADC multimode group regular conversions are transferred by DMA, one DMA channel for both ADC (DMA of ADC master), in unlimited mode: DMA transfer requests are unlimited, whatever number of DMA data transferred (number of ADC conversions). This ADC mode is intended to be used with DMA mode circular. Setting for ADC resolution of 8 and 6 bits

| <b><i>ADC group regular - Trigger source</i></b> |                                                                                                                                                                                    |
| LL_ADC_REG_TRIG_SOFTWARE                         | ADC group regular conversion trigger internal: SW start.                                                                                                                           |
| LL_ADC_REG_TRIG_EXT_TIM1_CH1_ADC12               | ADC group regular conversion trigger from external IP: TIM1 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM1_CH2_ADC12               | ADC group regular conversion trigger from external IP: TIM1 channel 2 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM1_CH3                     | ADC group regular conversion trigger from external IP: TIM1 channel 3 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM1_CH3                     | ADC group regular conversion trigger from external IP: TIM1 channel 3 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM2_CH2_ADC12               | ADC group regular conversion trigger from external IP: TIM2 channel 2 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM3_TRGO_ADC12              | ADC group regular conversion trigger from external IP: TIM3 TRGO. Trigger edge set to rising edge                                                                                  |

|                                       |                                                                                                                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                       | (default setting).                                                                                                                                                                 |
| LL_ADC_REG_TRIG_EXT_TIM4_CH4_ADC12    | ADC group regular conversion trigger from external IP: TIM4 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT EXTI_LINE11_ADC12 | ADC group regular conversion trigger from external IP: external interrupt line 11. Trigger edge set to rising edge (default setting).                                              |
| LL_ADC_REG_TRIG_EXT_TIM8_TRGO_ADC12   | ADC group regular conversion trigger from external IP: TIM8 TRGO. Trigger edge set to rising edge (default setting).                                                               |
| LL_ADC_REG_TRIG_EXT_TIM8_TRGO2        | ADC group regular conversion trigger from external IP: TIM8 TRGO2. Trigger edge set to rising edge (default setting).                                                              |
| LL_ADC_REG_TRIG_EXT_TIM8_TRGO2        | ADC group regular conversion trigger from external IP: TIM8 TRGO2. Trigger edge set to rising edge (default setting).                                                              |
| LL_ADC_REG_TRIG_EXT_TIM1_TRGO         | ADC group regular conversion trigger from external IP: TIM1 TRGO. Trigger edge set to rising edge (default setting).                                                               |
| LL_ADC_REG_TRIG_EXT_TIM1_TRGO         | ADC group regular conversion trigger from external IP: TIM1 TRGO. Trigger edge set to rising edge (default setting).                                                               |
| LL_ADC_REG_TRIG_EXT_TIM1_TRGO2        | ADC group regular conversion trigger from external IP: TIM1 TRGO2. Trigger edge set to rising edge (default setting).                                                              |
| LL_ADC_REG_TRIG_EXT_TIM1_TRGO2        | ADC group regular conversion trigger from external IP: TIM1 TRGO2. Trigger edge set to rising edge (default setting).                                                              |
| LL_ADC_REG_TRIG_EXT_TIM2_TRGO_ADC12   | ADC group regular conversion trigger from external IP: TIM2 TRGO. Trigger edge set to rising edge (default setting).                                                               |
| LL_ADC_REG_TRIG_EXT_TIM4_TRGO         | ADC group regular conversion trigger from external IP: TIM4 TRGO. Trigger edge set to rising edge (default setting).                                                               |
| LL_ADC_REG_TRIG_EXT_TIM4_TRGO         | ADC group regular conversion trigger from external IP: TIM4 TRGO.                                                                                                                  |

|                                      |                                                                                                                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | Trigger edge set to rising edge<br>(default setting).                                                                                                                              |
| LL_ADC_REG_TRIG_EXT_TIM6_TRGO_ADC12  | ADC group regular conversion trigger from external IP: TIM6 TRGO.<br>Trigger edge set to rising edge<br>(default setting).                                                         |
| LL_ADC_REG_TRIG_EXT_TIM15_TRGO       | ADC group regular conversion trigger from external IP: TIM15 TRGO.<br>Trigger edge set to rising edge<br>(default setting).                                                        |
| LL_ADC_REG_TRIG_EXT_TIM15_TRGO       | ADC group regular conversion trigger from external IP: TIM15 TRGO.<br>Trigger edge set to rising edge<br>(default setting).                                                        |
| LL_ADC_REG_TRIG_EXT_TIM3_CH4_ADC12   | ADC group regular conversion trigger from external IP: TIM3 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM3_CH1_ADC34   | ADC group regular conversion trigger from external IP: TIM3 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM2_CH3_ADC34   | ADC group regular conversion trigger from external IP: TIM2 channel 3 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM8_CH1_ADC34   | ADC group regular conversion trigger from external IP: TIM8 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM8_TRGO_ADC34  | ADC group regular conversion trigger from external IP: TIM8 TRGO.<br>Trigger edge set to rising edge<br>(default setting).                                                         |
| LL_ADC_REG_TRIG_EXT EXTI_LINE2_ADC34 | ADC group regular conversion trigger from external IP: external interrupt line 2. Trigger edge set to rising edge (default setting).                                               |
| LL_ADC_REG_TRIG_EXT_TIM4_CH1_ADC34   | ADC group regular conversion trigger from external IP: TIM4 channel 1 event (capture compare: input capture or output capture). Trigger                                            |

|                                     |                                                                                                                         |                                            |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
|                                     |                                                                                                                         | edge set to rising edge (default setting). |
| LL_ADC_REG_TRIG_EXT_TIM2_TRGO_ADC34 | ADC group regular conversion trigger from external IP: TIM2 TRGO.<br>Trigger edge set to rising edge (default setting). |                                            |
| LL_ADC_REG_TRIG_EXT_TIM3_TRGO_ADC34 | ADC group regular conversion trigger from external IP: TIM3 TRGO.<br>Trigger edge set to rising edge (default setting). |                                            |
| LL_ADC_REG_TRIG_EXT_TIM7_TRGO_ADC34 | ADC group regular conversion trigger from external IP: TIM7 TRGO.<br>Trigger edge set to rising edge (default setting). |                                            |
| LL_ADC_REG_TRIG_EXT_TIM2_CC1_ADC34  | ADC group regular conversion trigger from external IP: TIM2 CCx. Trigger edge set to rising edge (default setting).     |                                            |

**ADC instance - Resolution**

|                       |                        |
|-----------------------|------------------------|
| LL_ADC_RESOLUTION_12B | ADC resolution 12 bits |
| LL_ADC_RESOLUTION_10B | ADC resolution 10 bits |
| LL_ADC_RESOLUTION_8B  | ADC resolution 8 bits  |
| LL_ADC_RESOLUTION_6B  | ADC resolution 6 bits  |

**ADC helper macro**

`_LL_ADC_CHANNEL_TO_DECIMAL_NB`

**Description:**

- Helper macro to get ADC channel number in decimal format from literals  
`LL_ADC_CHANNEL_x`.

**Parameters:**

- `_CHANNEL_`: This parameter can be one of the following values:
  - `LL_ADC_CHANNEL_0`
  - `LL_ADC_CHANNEL_1`
  - `LL_ADC_CHANNEL_2`
  - `LL_ADC_CHANNEL_3`
  - `LL_ADC_CHANNEL_4`
  - `LL_ADC_CHANNEL_5`
  - `LL_ADC_CHANNEL_6`
  - `LL_ADC_CHANNEL_7`
  - `LL_ADC_CHANNEL_8`
  - `LL_ADC_CHANNEL_9`
  - `LL_ADC_CHANNEL_10`
  - `LL_ADC_CHANNEL_11`
  - `LL_ADC_CHANNEL_12`
  - `LL_ADC_CHANNEL_13`
  - `LL_ADC_CHANNEL_14`
  - `LL_ADC_CHANNEL_15`

- LL\_ADC\_CHANNEL\_16
- LL\_ADC\_CHANNEL\_17
- LL\_ADC\_CHANNEL\_18
- LL\_ADC\_CHANNEL\_VREFINT (5)
- LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
- LL\_ADC\_CHANNEL\_VBAT (1)
- LL\_ADC\_CHANNEL\_VOPAMP1 (1)
- LL\_ADC\_CHANNEL\_VOPAMP2 (2)
- LL\_ADC\_CHANNEL\_VOPAMP3 (3)
- LL\_ADC\_CHANNEL\_VOPAMP4 (4)

**Return value:**

- Value: between Min\_Data=0 and Max\_Data=18

**Notes:**

- Example:  
`_LL_ADC_CHANNEL_TO_DECIMAL_NB(LL_ADC_CHANNEL_4)` will return decimal number "4".  
 The input can be a value from functions where a channel number is returned, either defined with number or with bitfield (only one bit must be set).

[\\_LL\\_ADC\\_DECIMAL\\_NB\\_TO\\_CHANNEL](#)

**Description:**

- Helper macro to get ADC channel in literal format `LL_ADC_CHANNEL_x` from number in decimal format.

**Parameters:**

- [\\_\\_DECIMAL\\_NB\\_\\_](#): Value between Min\_Data=0 and Max\_Data=18

**Return value:**

- Returned: value can be one of the following values:

- LL\_ADC\_CHANNEL\_0
- LL\_ADC\_CHANNEL\_1
- LL\_ADC\_CHANNEL\_2
- LL\_ADC\_CHANNEL\_3
- LL\_ADC\_CHANNEL\_4
- LL\_ADC\_CHANNEL\_5
- LL\_ADC\_CHANNEL\_6
- LL\_ADC\_CHANNEL\_7
- LL\_ADC\_CHANNEL\_8
- LL\_ADC\_CHANNEL\_9
- LL\_ADC\_CHANNEL\_10
- LL\_ADC\_CHANNEL\_11
- LL\_ADC\_CHANNEL\_12
- LL\_ADC\_CHANNEL\_13
- LL\_ADC\_CHANNEL\_14
- LL\_ADC\_CHANNEL\_15
- LL\_ADC\_CHANNEL\_16
- LL\_ADC\_CHANNEL\_17
- LL\_ADC\_CHANNEL\_18

- LL\_ADC\_CHANNEL\_VREFINT (5)
- LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
- LL\_ADC\_CHANNEL\_VBAT (1)
- LL\_ADC\_CHANNEL\_VOPAMP1 (1)
- LL\_ADC\_CHANNEL\_VOPAMP2 (2)
- LL\_ADC\_CHANNEL\_VOPAMP3 (3)
- LL\_ADC\_CHANNEL\_VOPAMP4 (4)

**Notes:**

- Example:  
`__LL_ADC_DECIMAL_NB_TO_CHANNEL(4)` will return a data equivalent to "LL\_ADC\_CHANNEL\_4".

LL\_ADC\_IS\_CHANNEL\_INTERNAL

**Description:**

- Helper macro to determine whether the selected channel corresponds to literal definitions of driver.

**Parameters:**

- CHANNEL: This parameter can be one of the following values:
  - LL\_ADC\_CHANNEL\_0
  - LL\_ADC\_CHANNEL\_1
  - LL\_ADC\_CHANNEL\_2
  - LL\_ADC\_CHANNEL\_3
  - LL\_ADC\_CHANNEL\_4
  - LL\_ADC\_CHANNEL\_5
  - LL\_ADC\_CHANNEL\_6
  - LL\_ADC\_CHANNEL\_7
  - LL\_ADC\_CHANNEL\_8
  - LL\_ADC\_CHANNEL\_9
  - LL\_ADC\_CHANNEL\_10
  - LL\_ADC\_CHANNEL\_11
  - LL\_ADC\_CHANNEL\_12
  - LL\_ADC\_CHANNEL\_13
  - LL\_ADC\_CHANNEL\_14
  - LL\_ADC\_CHANNEL\_15
  - LL\_ADC\_CHANNEL\_16
  - LL\_ADC\_CHANNEL\_17
  - LL\_ADC\_CHANNEL\_18
  - LL\_ADC\_CHANNEL\_VREFINT (5)
  - LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
  - LL\_ADC\_CHANNEL\_VBAT (1)
  - LL\_ADC\_CHANNEL\_VOPAMP1 (1)
  - LL\_ADC\_CHANNEL\_VOPAMP2 (2)
  - LL\_ADC\_CHANNEL\_VOPAMP3 (3)
  - LL\_ADC\_CHANNEL\_VOPAMP4 (4)

**Return value:**

- Value: "0" if the channel corresponds to a parameter definition of a ADC external channel (channel connected to a GPIO pin). Value "1" if the channel corresponds to a parameter definition

of a ADC internal channel.

**Notes:**

- The different literal definitions of ADC channels are: ADC internal channel:  
LL\_ADC\_CHANNEL\_VREFINT,  
LL\_ADC\_CHANNEL\_TEMPSENSOR, ...ADC external channel (channel connected to a GPIO pin): LL\_ADC\_CHANNEL\_1,  
LL\_ADC\_CHANNEL\_2, ... The channel parameter must be a value defined from literal definition of a ADC internal channel  
(LL\_ADC\_CHANNEL\_VREFINT,  
LL\_ADC\_CHANNEL\_TEMPSENSOR, ...), ADC external channel (LL\_ADC\_CHANNEL\_1,  
LL\_ADC\_CHANNEL\_2, ...), must not be a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

LL\_ADC\_CHANNEL\_INTERNAL\_TO\_EXTERNAL

**Description:**

- Helper macro to convert a channel defined from parameter definition of a ADC internal channel (LL\_ADC\_CHANNEL\_VREFINT, LL\_ADC\_CHANNEL\_TEMPSENSOR, ...), to its equivalent parameter definition of a ADC external channel (LL\_ADC\_CHANNEL\_1, LL\_ADC\_CHANNEL\_2, ...).

**Parameters:**

- \_\_CHANNEL\_\_: This parameter can be one of the following values:
  - LL\_ADC\_CHANNEL\_0
  - LL\_ADC\_CHANNEL\_1
  - LL\_ADC\_CHANNEL\_2
  - LL\_ADC\_CHANNEL\_3
  - LL\_ADC\_CHANNEL\_4
  - LL\_ADC\_CHANNEL\_5
  - LL\_ADC\_CHANNEL\_6
  - LL\_ADC\_CHANNEL\_7
  - LL\_ADC\_CHANNEL\_8
  - LL\_ADC\_CHANNEL\_9
  - LL\_ADC\_CHANNEL\_10
  - LL\_ADC\_CHANNEL\_11
  - LL\_ADC\_CHANNEL\_12
  - LL\_ADC\_CHANNEL\_13
  - LL\_ADC\_CHANNEL\_14
  - LL\_ADC\_CHANNEL\_15
  - LL\_ADC\_CHANNEL\_16
  - LL\_ADC\_CHANNEL\_17
  - LL\_ADC\_CHANNEL\_18
  - LL\_ADC\_CHANNEL\_VREFINT (5)

- LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
- LL\_ADC\_CHANNEL\_VBAT (1)
- LL\_ADC\_CHANNEL\_VOPAMP1 (1)
- LL\_ADC\_CHANNEL\_VOPAMP2 (2)
- LL\_ADC\_CHANNEL\_VOPAMP3 (3)
- LL\_ADC\_CHANNEL\_VOPAMP4 (4)

**Return value:**

- Returned: value can be one of the following values:
  - LL\_ADC\_CHANNEL\_0
  - LL\_ADC\_CHANNEL\_1
  - LL\_ADC\_CHANNEL\_2
  - LL\_ADC\_CHANNEL\_3
  - LL\_ADC\_CHANNEL\_4
  - LL\_ADC\_CHANNEL\_5
  - LL\_ADC\_CHANNEL\_6
  - LL\_ADC\_CHANNEL\_7
  - LL\_ADC\_CHANNEL\_8
  - LL\_ADC\_CHANNEL\_9
  - LL\_ADC\_CHANNEL\_10
  - LL\_ADC\_CHANNEL\_11
  - LL\_ADC\_CHANNEL\_12
  - LL\_ADC\_CHANNEL\_13
  - LL\_ADC\_CHANNEL\_14
  - LL\_ADC\_CHANNEL\_15
  - LL\_ADC\_CHANNEL\_16
  - LL\_ADC\_CHANNEL\_17
  - LL\_ADC\_CHANNEL\_18

**Notes:**

- The channel parameter can be, additionally to a value defined from parameter definition of a ADC internal channel (LL\_ADC\_CHANNEL\_VREFINT, LL\_ADC\_CHANNEL\_TEMPSENSOR, ...), a value defined from parameter definition of ADC external channel (LL\_ADC\_CHANNEL\_1, LL\_ADC\_CHANNEL\_2, ...) or a value from functions where a channel number is returned from ADC registers.

`_LL_ADC_IS_CHANNEL_INTERNAL_AVAILABLE`**Description:**

- Helper macro to determine whether the internal channel selected is available on the ADC instance selected.

**Parameters:**

- `_ADC_INSTANCE_`: ADC instance
- `_CHANNEL_`: This parameter can be one of the following values:
  - `LL_ADC_CHANNEL_VREFINT` (5)
  - `LL_ADC_CHANNEL_TEMPSENSOR` (1)
  - `LL_ADC_CHANNEL_VBAT` (1)
  - `LL_ADC_CHANNEL_VOPAMP1` (1)
  - `LL_ADC_CHANNEL_VOPAMP2` (2)
  - `LL_ADC_CHANNEL_VOPAMP3` (3)
  - `LL_ADC_CHANNEL_VOPAMP4` (4)

**Return value:**

- Value: "0" if the internal channel selected is not available on the ADC instance selected. Value "1" if the internal channel selected is available on the ADC instance selected.

**Notes:**

- The channel parameter must be a value defined from parameter definition of a ADC internal channel (`LL_ADC_CHANNEL_VREFINT`, `LL_ADC_CHANNEL_TEMPSENSOR`, ...), must not be a value defined from parameter definition of ADC external channel (`LL_ADC_CHANNEL_1`, `LL_ADC_CHANNEL_2`, ...) or a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

`_LL_ADC_ANALOGWD_CHANNEL_GROUP`**Description:**

- Helper macro to define ADC analog watchdog parameter: define a single channel to monitor with analog watchdog from sequencer channel and groups definition.

**Parameters:**

- `_CHANNEL_`: This parameter can be one of the following values:
  - `LL_ADC_CHANNEL_0`
  - `LL_ADC_CHANNEL_1`
  - `LL_ADC_CHANNEL_2`
  - `LL_ADC_CHANNEL_3`
  - `LL_ADC_CHANNEL_4`
  - `LL_ADC_CHANNEL_5`
  - `LL_ADC_CHANNEL_6`

- LL\_ADC\_CHANNEL\_7
- LL\_ADC\_CHANNEL\_8
- LL\_ADC\_CHANNEL\_9
- LL\_ADC\_CHANNEL\_10
- LL\_ADC\_CHANNEL\_11
- LL\_ADC\_CHANNEL\_12
- LL\_ADC\_CHANNEL\_13
- LL\_ADC\_CHANNEL\_14
- LL\_ADC\_CHANNEL\_15
- LL\_ADC\_CHANNEL\_16
- LL\_ADC\_CHANNEL\_17
- LL\_ADC\_CHANNEL\_18
- LL\_ADC\_CHANNEL\_VREFINT (5)
- LL\_ADC\_CHANNEL\_TEMPSENSOR (1)
- LL\_ADC\_CHANNEL\_VBAT (1)
- LL\_ADC\_CHANNEL\_VOPAMP1 (1)
- LL\_ADC\_CHANNEL\_VOPAMP2 (2)
- LL\_ADC\_CHANNEL\_VOPAMP3 (3)
- LL\_ADC\_CHANNEL\_VOPAMP4 (4)
- \_\_GROUP\_\_: This parameter can be one of the following values:
  - LL\_ADC\_GROUP\_REGULAR
  - LL\_ADC\_GROUP\_INJECTED
  - LL\_ADC\_GROUP\_REGULAR\_INJECTED

**Return value:**

- Returned: value can be one of the following values:
  - LL\_ADC\_AWD\_DISABLE
  - LL\_ADC\_AWD\_ALL\_CHANNELS\_REG (0)
  - LL\_ADC\_AWD\_ALL\_CHANNELS\_INJ (0)
  - LL\_ADC\_AWD\_ALL\_CHANNELS\_REG\_INJ

- LL\_ADC\_AWD\_CH\_VOPAMP4\_REG\_INJ (4)

**Notes:**

- To be used with function  
`LL_ADC_SetAnalogWDMonitChannels()`.  
Example: `LL_ADC_SetAnalogWDMonitChannels(ADC1, LL_ADC_AWD1,  
__LL_ADC_ANALOGWD_CHANNEL_GROUP(LL_ADC_CHANNEL4,  
LL_ADC_GROUP_REGULAR))`

[\\_\\_LL\\_ADC\\_ANALOGWD\\_SET\\_THRESHOLD\\_RESOLUTION](#)**Description:**

- Helper macro to set the value of ADC analog watchdog threshold high or low in function of ADC resolution, when ADC resolution is different of 12 bits.

**Parameters:**

- \_\_ADC\_RESOLUTION\_\_: This parameter can be one of the following values:
  - LL\_ADC\_RESOLUTION\_12B
  - LL\_ADC\_RESOLUTION\_10B
  - LL\_ADC\_RESOLUTION\_8B
  - LL\_ADC\_RESOLUTION\_6B
- \_\_AWD\_THRESHOLD\_\_: Value between Min\_Data=0x000 and Max\_Data=0xFFFF

**Return value:**

- Value: between Min\_Data=0x000 and Max\_Data=0xFFFF

**Notes:**

- To be used with function  
`LL_ADC_ConfigAnalogWDThresholds()` or  
`LL_ADC_SetAnalogWDThresholds()`. Example,  
with a ADC resolution of 8 bits, to set the value of  
analog watchdog threshold high (on 8 bits):  
`LL_ADC_SetAnalogWDThresholds (< ADCx param>,  
__LL_ADC_ANALOGWD_SET_THRESHOLD_RESOLUTION(LL_ADC_RESOLUTION_8B,  
<threshold_value_8_bits>) );`

[\\_\\_LL\\_ADC\\_ANALOGWD\\_GET\\_THRESHOLD\\_RESOLUTION](#)**Description:**

- Helper macro to get the value of ADC analog watchdog threshold high or low in function of ADC resolution, when ADC resolution is different of 12 bits.

**Parameters:**

- [\\_\\_ADC\\_RESOLUTION\\_\\_](#): This parameter can be one of the following values:
  - [LL\\_ADC\\_RESOLUTION\\_12B](#)
  - [LL\\_ADC\\_RESOLUTION\\_10B](#)
  - [LL\\_ADC\\_RESOLUTION\\_8B](#)
  - [LL\\_ADC\\_RESOLUTION\\_6B](#)
- [\\_\\_AWD\\_THRESHOLD\\_12\\_BITS\\_\\_](#): Value between Min\_Data=0x000 and Max\_Data=0xFFFF

**Return value:**

- Value: between Min\_Data=0x000 and Max\_Data=0xFFFF

**Notes:**

- To be used with function LL\_ADC\_GetAnalogWDThresholds(). Example, with a ADC resolution of 8 bits, to get the value of analog watchdog threshold high (on 8 bits): <threshold\_value\_6\_bits> = [\\_\\_LL\\_ADC\\_ANALOGWD\\_GET\\_THRESHOLD\\_RESOLUTION\(LL\\_ADC\\_RESOLUTION\\_8B, LL\\_ADC\\_GetAnalogWDThresholds\(<ADCx param>, LL\\_ADC\\_AWD\\_THRESHOLD\\_HIGH\)\)](#);

[\\_\\_LL\\_ADC\\_ANALOGWD\\_THRESHOLDS\\_HIGH\\_LOW](#)**Description:**

- Helper macro to get the ADC analog watchdog threshold high or low from raw value containing both thresholds concatenated.

**Parameters:**

- [\\_\\_AWD\\_THRESHOLD\\_TYPE\\_\\_](#): This parameter can be one of the following values:
  - [LL\\_ADC\\_AWD\\_THRESHOLD\\_HIGH](#)
  - [LL\\_ADC\\_AWD\\_THRESHOLD\\_LOW](#)
- [\\_\\_AWD\\_THRESHOLDS\\_\\_](#): Value between Min\_Data=0x00000000 and Max\_Data=0xFFFFFFFF

**Return value:**

- Value: between Min\_Data=0x000 and Max\_Data=0xFFFF

**Notes:**

- To be used with function LL\_ADC\_GetAnalogWDThresholds(). Example, to

---

get analog watchdog threshold high from the register raw value:  
`__LL_ADC_ANALOGWD_THRESHOLDS_HIGH_LOW(LL_ADC_AWD_THRESHOLD_HIGH,  
<raw_value_with_both_thresholds>);`

### `__LL_ADC_CALIB_FACTOR_SINGLE_DIFF`

**Description:**

- Helper macro to set the ADC calibration value with both single ended and differential modes calibration factors concatenated.

**Parameters:**

- `__CALIB_FACTOR_SINGLE_ENDED__`: Value between Min\_Data=0x00 and Max\_Data=0x7F
- `__CALIB_FACTOR_DIFFERENTIAL__`: Value between Min\_Data=0x00 and Max\_Data=0x7F

**Return value:**

- Value: between Min\_Data=0x00000000 and Max\_Data=0xFFFFFFFF

**Notes:**

- To be used with function `LL_ADC_SetCalibrationFactor()`. Example, to set calibration factors single ended to 0x55 and differential ended to 0x2A:  
`LL_ADC_SetCalibrationFactor( ADC1,  
__LL_ADC_CALIB_FACTOR_SINGLE_DIFF(0x55, 0x2A))`

### `__LL_ADC_MULTI_CONV_DATA_MASTER_SLAVE`

**Description:**

- Helper macro to get the ADC multimode conversion data of ADC master or ADC slave from raw value with both ADC conversion data concatenated.

**Parameters:**

- `__ADC_MULTI_MASTER_SLAVE__`: This parameter can be one of the following values:
  - `LL_ADC_MULTI_MASTER`
  - `LL_ADC_MULTI_SLAVE`
- `__ADC_MULTI_CONV_DATA__`: Value between Min\_Data=0x000 and Max\_Data=0xFFFF

**Return value:**

- Value: between Min\_Data=0x000 and Max\_Data=0xFFFF

**Notes:**

- This macro is intended to be used when multimode transfer by DMA is enabled: refer to function `LL_ADC_SetMultiDMATransfer()`. In this case the transferred data need to be processed with this macro to separate the conversion data of ADC

master and ADC slave.

### \_\_LL\_ADC\_COMMON\_INSTANCE

#### Description:

- Helper macro to select the ADC common instance to which is belonging the selected ADC instance.

#### Parameters:

- \_\_ADCx\_\_: ADC instance

#### Return value:

- ADC: common register instance

#### Notes:

- ADC common register instance can be used for: Set parameters common to several ADC instancesMultimode (for devices with several ADC instances) Refer to functions having argument "ADCxy\_COMMON" as parameter.

### \_\_LL\_ADC\_IS\_ENABLED\_ALL\_COMMON\_INSTANCE

#### Description:

- Helper macro to check if all ADC instances sharing the same ADC common instance are disabled.

#### Parameters:

- \_\_ADCXY\_COMMON\_\_: ADC common instance (can be set directly from CMSIS definition or by using helper macro

#### Return value:

- Value: "0" if all ADC instances sharing the same ADC common instance are disabled. Value "1" if at least one ADC instance sharing the same ADC common instance is enabled.

#### Notes:

- This check is required by functions with setting conditioned to ADC state: All ADC instances of the ADC common group must be disabled. Refer to functions having argument "ADCxy\_COMMON" as parameter. On devices with only 1 ADC common instance, parameter of this macro is useless and can be ignored (parameter kept for compatibility with devices featuring several ADC common instances).

### \_\_LL\_ADC\_DIGITAL\_SCALE

#### Description:

- Helper macro to define the ADC conversion data full-scale digital value corresponding to the selected ADC resolution.

#### Parameters:

- \_\_ADC\_RESOLUTION\_\_: This parameter can be one of the following values:

- LL\_ADC\_RESOLUTION\_12B
- LL\_ADC\_RESOLUTION\_10B
- LL\_ADC\_RESOLUTION\_8B
- LL\_ADC\_RESOLUTION\_6B

**Return value:**

- ADC: conversion data equivalent voltage value (unit: mVolt)

**Notes:**

- ADC conversion data full-scale corresponds to voltage range determined by analog voltage references Vref+ and Vref- (refer to reference manual).

**\_\_LL\_ADC\_CONVERT\_DATA\_RESOLUTION****Description:**

- Helper macro to convert the ADC conversion data from a resolution to another resolution.

**Parameters:**

- \_\_DATA\_\_: ADC conversion data to be converted
- \_\_ADC\_RESOLUTION\_CURRENT\_\_: Resolution of the data to be converted This parameter can be one of the following values:
  - LL\_ADC\_RESOLUTION\_12B
  - LL\_ADC\_RESOLUTION\_10B
  - LL\_ADC\_RESOLUTION\_8B
  - LL\_ADC\_RESOLUTION\_6B
- \_\_ADC\_RESOLUTION\_TARGET\_\_: Resolution of the data after conversion This parameter can be one of the following values:
  - LL\_ADC\_RESOLUTION\_12B
  - LL\_ADC\_RESOLUTION\_10B
  - LL\_ADC\_RESOLUTION\_8B
  - LL\_ADC\_RESOLUTION\_6B

**Return value:**

- ADC: conversion data to the requested resolution

**\_\_LL\_ADC\_CALC\_DATA\_TO\_VOLTAGE****Description:**

- Helper macro to calculate the voltage (unit: mVolt) corresponding to a ADC conversion data (unit: digital value).

**Parameters:**

- \_\_VREFANALOG\_VOLTAGE\_\_: Analog reference voltage (unit: mV)
- \_\_ADC\_DATA\_\_: ADC conversion data (resolution 12 bits) (unit: digital value).
- \_\_ADC\_RESOLUTION\_\_: This parameter can be one of the following values:
  - LL\_ADC\_RESOLUTION\_12B
  - LL\_ADC\_RESOLUTION\_10B
  - LL\_ADC\_RESOLUTION\_8B

- LL\_ADC\_RESOLUTION\_6B

**Return value:**

- ADC: conversion data equivalent voltage value  
(unit: mVolt)

**Notes:**

- Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro  
\_\_LL\_ADC\_CALC\_VREFANALOG\_VOLTAGE().

\_\_LL\_ADC\_CALC\_VREF  
ANALOG\_VOLTAGE

**Description:**

- Helper macro to calculate analog reference voltage (Vref+) (unit: mVolt) from ADC conversion data of internal voltage reference VrefInt.

**Parameters:**

- \_\_VREFINT\_ADC\_DATA\_\_: ADC conversion data (resolution 12 bits) of internal voltage reference VrefInt (unit: digital value).
- \_\_ADC\_RESOLUTION\_\_: This parameter can be one of the following values:
  - LL\_ADC\_RESOLUTION\_12B
  - LL\_ADC\_RESOLUTION\_10B
  - LL\_ADC\_RESOLUTION\_8B
  - LL\_ADC\_RESOLUTION\_6B

**Return value:**

- Analog: reference voltage (unit: mV)

**Notes:**

- Computation is using VrefInt calibration value stored in system memory for each device during production. This voltage depends on user board environment: voltage level connected to pin Vref+. On devices with small package, the pin Vref+ is not present and internally bonded to pin Vdda. On this STM32 serie, calibration data of internal voltage reference VrefInt corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of internal voltage reference VrefInt. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

\_\_LL\_ADC\_CALC\_  
TEMPERATURE

**Description:**

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

**Parameters:**

- \_\_VREFANALOG\_VOLTAGE\_\_: Analog

- reference voltage (unit: mV)
- `__TEMPSENSOR_ADC_DATA__`: ADC conversion data of internal temperature sensor (unit: digital value).
- `__ADC_RESOLUTION__`: ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - `LL_ADC_RESOLUTION_12B`
  - `LL_ADC_RESOLUTION_10B`
  - `LL_ADC_RESOLUTION_8B`
  - `LL_ADC_RESOLUTION_6B`

**Return value:**

- Temperature: (unit: degree Celsius)

**Notes:**

- Computation is using temperature sensor calibration values stored in system memory for each device during production. Calculation formula: Temperature = ((TS\_ADC\_DATA - TS\_CAL1) \* (TS\_CAL2\_TEMP - TS\_CAL1\_TEMP)) / (TS\_CAL2 - TS\_CAL1) + TS\_CAL1\_TEMP with TS\_ADC\_DATA = temperature sensor raw data measured by ADC Avg\_Slope = (TS\_CAL2 - TS\_CAL1) / (TS\_CAL2\_TEMP - TS\_CAL1\_TEMP) TS\_CAL1 = equivalent TS\_ADC\_DATA at temperature TEMP\_DEGC\_CAL1 (calibrated in factory) TS\_CAL2 = equivalent TS\_ADC\_DATA at temperature TEMP\_DEGC\_CAL2 (calibrated in factory) Caution: Calculation relevancy under reserve that calibration parameters are correct (address and data). To calculate temperature using temperature sensor datasheet typical values (generic values less, therefore less accurate than calibrated values), use helper macro `__LL_ADC_CALC_TEMPERATURE_TYP_PARA_MS()`. As calculation input, the analog reference voltage (Vref+) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro `__LL_ADC_CALC_VREFANALOG_VOLTAGE()`. On this STM32 serie, calibration data of temperature sensor corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of temperature sensor. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

[\\_\\_LL\\_ADC\\_CALC\\_TEMPERATURE\\_TYP\\_PARAMS](#)**Description:**

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

**Parameters:**

- [\\_\\_TEMPSENSOR\\_TYP\\_AVGSLOPE](#): Device datasheet data: Temperature sensor slope typical value (unit: uV/DegCelsius). On STM32F3, refer to device datasheet parameter "Avg\_Slope".
- [\\_\\_TEMPSENSOR\\_TYP\\_CALX\\_V](#): Device datasheet data: Temperature sensor voltage typical value (at temperature and Vref+ defined in parameters below) (unit: mV). On STM32F3, refer to device datasheet parameter "V25" (corresponding to TS\_CAL1).
- [\\_\\_TEMPSENSOR\\_CALX\\_TEMP](#): Device datasheet data: Temperature at which temperature sensor voltage (see parameter above) is corresponding (unit: mV)
- [\\_\\_VREFANALOG\\_VOLTAGE](#): Analog voltage reference (Vref+) voltage (unit: mV)
- [\\_\\_TEMPSENSOR\\_ADC\\_DATA](#): ADC conversion data of internal temperature sensor (unit: digital value).
- [\\_\\_ADC\\_RESOLUTION](#): ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - [LL\\_ADC\\_RESOLUTION\\_12B](#)
  - [LL\\_ADC\\_RESOLUTION\\_10B](#)
  - [LL\\_ADC\\_RESOLUTION\\_8B](#)
  - [LL\\_ADC\\_RESOLUTION\\_6B](#)

**Return value:**

- Temperature: (unit: degree Celsius)

**Notes:**

- Computation is using temperature sensor typical values (refer to device datasheet). Calculation formula: Temperature =  $(TS\_TYP\_CALx\_VOLT(uV) - TS\_ADC\_DATA * Conversion\_uV) / Avg\_Slope + CALx\_TEMP$  with TS\_ADC\_DATA = temperature sensor raw data measured by ADC (unit: digital value) Avg\_Slope = temperature sensor slope (unit: uV/Degree Celsius) TS\_TYP\_CALx\_VOLT = temperature sensor digital value at temperature CALx\_TEMP (unit: mV) Caution: Calculation relevancy under reserve the temperature sensor of the current device has characteristics in line with datasheet typical values. If temperature sensor calibration values are available on this device (presence of macro [\\_\\_LL\\_ADC\\_CALC\\_TEMPERATURE\(\)](#)),

temperature calculation will be more accurate using helper macro

`__LL_ADC_CALC_TEMPERATURE()`. As calculation input, the analog reference voltage ( $V_{ref+}$ ) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage ( $V_{ref+}$ ) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro

`__LL_ADC_CALC_VREFANALOG_VOLTAGE()`. ADC measurement data must correspond to a resolution of 12bits (full scale digital value 4095). If not the case, the data must be preliminarily rescaled to an equivalent resolution of 12 bits.

#### **Common write and read registers Macros**

##### **LL\_ADC\_WriteReg**

###### **Description:**

- Write a value in ADC register.

###### **Parameters:**

- `__INSTANCE__`: ADC Instance
- `__REG__`: Register to be written
- `__VALUE__`: Value to be written in the register

###### **Return value:**

- None

##### **LL\_ADC\_ReadReg**

###### **Description:**

- Read a value in ADC register.

###### **Parameters:**

- `__INSTANCE__`: ADC Instance
- `__REG__`: Register to be read

###### **Return value:**

- Register: value

## 60 LL BUS Generic Driver

### 60.1 BUS Firmware driver API description

#### 60.1.1 Detailed description of functions

##### **LL\_AHB1\_GRP1\_EnableClock**

Function name **STATIC\_INLINE void LL\_AHB1\_GRP1\_EnableClock (uint32\_t Periph)**

Function description Enable AHB1 peripherals clock.

Parameters • **Periph:** This parameter can be a combination of the following values: (\*) value not defined in all devices.

- LL\_AHB1\_GRP1\_PERIPH\_DMA1
- LL\_AHB1\_GRP1\_PERIPH\_DMA2 (\*)
- LL\_AHB1\_GRP1\_PERIPH\_SRAM
- LL\_AHB1\_GRP1\_PERIPH\_FLASH
- LL\_AHB1\_GRP1\_PERIPH\_FMC (\*)
- LL\_AHB1\_GRP1\_PERIPH\_CRC
- LL\_AHB1\_GRP1\_PERIPH\_GPIOH (\*)
- LL\_AHB1\_GRP1\_PERIPH\_GPIOA
- LL\_AHB1\_GRP1\_PERIPH\_GPIOB
- LL\_AHB1\_GRP1\_PERIPH\_GPIOC
- LL\_AHB1\_GRP1\_PERIPH\_GPIOD
- LL\_AHB1\_GRP1\_PERIPH\_GPIOE (\*)
- LL\_AHB1\_GRP1\_PERIPH\_GPIOF
- LL\_AHB1\_GRP1\_PERIPH\_GPIOG (\*)
- LL\_AHB1\_GRP1\_PERIPH\_TSC
- LL\_AHB1\_GRP1\_PERIPH\_ADC1 (\*)
- LL\_AHB1\_GRP1\_PERIPH\_ADC12 (\*)
- LL\_AHB1\_GRP1\_PERIPH\_ADC34 (\*)

Return values • **None**

**LL\_AHB1\_GRP1\_DisableClock**

Function name      **`_STATIC_INLINE void LL_AHB1_GRP1_DisableClock  
(uint32_t Periph)`**

Function description      Disable AHB1 peripherals clock.

- Parameters
- **Periph:** This parameter can be a combination of the following values: (\*) value not defined in all devices.
    - `LL_AHB1_GRP1_PERIPH_DMA1`
    - `LL_AHB1_GRP1_PERIPH_DMA2 (*)`
    - `LL_AHB1_GRP1_PERIPH_SRAM`
    - `LL_AHB1_GRP1_PERIPH_FLASH`
    - `LL_AHB1_GRP1_PERIPH_FMC (*)`
    - `LL_AHB1_GRP1_PERIPH_CRC`
    - `LL_AHB1_GRP1_PERIPH_GPIOH (*)`
    - `LL_AHB1_GRP1_PERIPH_GPIOA`
    - `LL_AHB1_GRP1_PERIPH_GPIOB`
    - `LL_AHB1_GRP1_PERIPH_GPIOC`
    - `LL_AHB1_GRP1_PERIPH_GPIOD`
    - `LL_AHB1_GRP1_PERIPH_GPIOE (*)`
    - `LL_AHB1_GRP1_PERIPH_GPIOF`
    - `LL_AHB1_GRP1_PERIPH_GPIOG (*)`
    - `LL_AHB1_GRP1_PERIPH_TSC`
    - `LL_AHB1_GRP1_PERIPH_ADC1 (*)`
    - `LL_AHB1_GRP1_PERIPH_ADC12 (*)`
    - `LL_AHB1_GRP1_PERIPH_ADC34 (*)`

- Return values
- **None**

### **LL\_APB1\_GRP1\_IsEnabledClock**

Function name      **\_STATIC\_INLINE uint32\_t LL\_APB1\_GRP1\_IsEnabledClock  
(uint32\_t Periph)**

Function description      Check if APB1 peripheral clock is enabled or not.

- Parameters
- **Periph:** This parameter can be a combination of the following values: (\*) value not defined in all devices.
    - LL\_APB1\_GRP1\_PERIPH\_TIM2
    - LL\_APB1\_GRP1\_PERIPH\_TIM3 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_TIM4 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_TIM5 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_TIM6
    - LL\_APB1\_GRP1\_PERIPH\_TIM7 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_TIM12 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_TIM13 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_TIM14 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_TIM18 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_WWDG
    - LL\_APB1\_GRP1\_PERIPH\_SPI2 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_SPI3 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_USART2
    - LL\_APB1\_GRP1\_PERIPH\_USART3
    - LL\_APB1\_GRP1\_PERIPH\_UART4 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_UART5 (\*)
    - LL\_APB1\_GRP1\_PERIPH\_I2C1

- LL\_APB1\_GRP1\_PERIPH\_I2C2 (\*)
- LL\_APB1\_GRP1\_PERIPH\_USB (\*)
- LL\_APB1\_GRP1\_PERIPH\_CAN (\*)
- LL\_APB1\_GRP1\_PERIPH\_DAC2 (\*)
- LL\_APB1\_GRP1\_PERIPH\_PWR
- LL\_APB1\_GRP1\_PERIPH\_DAC1
- LL\_APB1\_GRP1\_PERIPH\_CEC (\*)
- LL\_APB1\_GRP1\_PERIPH\_I2C3 (\*)

**Return values**

- **State:** of Periph (1 or 0).

### LL\_APB1\_GRP1\_ReleaseReset

Function name **`__STATIC_INLINE void LL_APB1_GRP1_ReleaseReset(uint32_t Periph)`**

Function description Release APB1 peripherals reset.

Parameters
 

- **Periph:** This parameter can be a combination of the following values: (\*) value not defined in all devices.

- LL\_APB1\_GRP1\_PERIPH\_ALL
- LL\_APB1\_GRP1\_PERIPH\_TIM2
- LL\_APB1\_GRP1\_PERIPH\_TIM3 (\*)
- LL\_APB1\_GRP1\_PERIPH\_TIM4 (\*)
- LL\_APB1\_GRP1\_PERIPH\_TIM5 (\*)
- LL\_APB1\_GRP1\_PERIPH\_TIM6
- LL\_APB1\_GRP1\_PERIPH\_TIM7 (\*)
- LL\_APB1\_GRP1\_PERIPH\_TIM12 (\*)
- LL\_APB1\_GRP1\_PERIPH\_TIM13 (\*)
- LL\_APB1\_GRP1\_PERIPH\_TIM14 (\*)
- LL\_APB1\_GRP1\_PERIPH\_TIM18 (\*)
- LL\_APB1\_GRP1\_PERIPH\_WWDG
- LL\_APB1\_GRP1\_PERIPH\_SPI2 (\*)
- LL\_APB1\_GRP1\_PERIPH\_SPI3 (\*)
- LL\_APB1\_GRP1\_PERIPH\_USART2
- LL\_APB1\_GRP1\_PERIPH\_USART3
- LL\_APB1\_GRP1\_PERIPH\_UART4 (\*)
- LL\_APB1\_GRP1\_PERIPH\_UART5 (\*)
- LL\_APB1\_GRP1\_PERIPH\_I2C1
- LL\_APB1\_GRP1\_PERIPH\_I2C2 (\*)
- LL\_APB1\_GRP1\_PERIPH\_USB (\*)
- LL\_APB1\_GRP1\_PERIPH\_CAN (\*)
- LL\_APB1\_GRP1\_PERIPH\_DAC2 (\*)
- LL\_APB1\_GRP1\_PERIPH\_PWR
- LL\_APB1\_GRP1\_PERIPH\_DAC1
- LL\_APB1\_GRP1\_PERIPH\_CEC (\*)
- LL\_APB1\_GRP1\_PERIPH\_I2C3 (\*)

Return values
 

- **None**

### LL\_APB2\_GRP1\_ReleaseReset

Function name **STATIC\_INLINE void LL\_APB2\_GRP1\_ReleaseReset (uint32\_t Periph)**

Function description Release APB2 peripherals reset.

- Parameters
- **Periph:** This parameter can be a combination of the following values: (\*) value not defined in all devices.
    - LL\_APB2\_GRP1\_PERIPH\_ALL
    - LL\_APB2\_GRP1\_PERIPH\_SYSCFG
    - LL\_APB2\_GRP1\_PERIPH\_ADC1 (\*)
    - LL\_APB2\_GRP1\_PERIPH\_TIM1 (\*)
    - LL\_APB2\_GRP1\_PERIPH\_SPI1 (\*)
    - LL\_APB2\_GRP1\_PERIPH\_TIM8 (\*)
    - LL\_APB2\_GRP1\_PERIPH\_USART1
    - LL\_APB2\_GRP1\_PERIPH\_SPI4 (\*)
    - LL\_APB2\_GRP1\_PERIPH\_TIM15

- LL\_APB2\_GRP1\_PERIPH\_TIM16
- LL\_APB2\_GRP1\_PERIPH\_TIM17
- LL\_APB2\_GRP1\_PERIPH\_TIM19 (\*)
- LL\_APB2\_GRP1\_PERIPH\_TIM20 (\*)
- LL\_APB2\_GRP1\_PERIPH\_HRTIM1 (\*)
- LL\_APB2\_GRP1\_PERIPH\_SDADC1 (\*)
- LL\_APB2\_GRP1\_PERIPH\_SDADC2 (\*)
- LL\_APB2\_GRP1\_PERIPH\_SDADC3 (\*)

**Return values**

- **None**

## 61 LL COMP Generic Driver

### 61.1 COMP Firmware driver registers structures

#### 61.1.1 LL\_COMP\_InitTypeDef

##### Data Fields

- *uint32\_t PowerMode*
- *uint32\_t InputPlus*
- *uint32\_t InputMinus*
- *uint32\_t InputHysteresis*
- *uint32\_t OutputSelection*
- *uint32\_t OutputPolarity*
- *uint32\_t OutputBlankingSource*

##### Field Documentation

- ***uint32\_t LL\_COMP\_InitTypeDef::PowerMode***  
Set comparator operating mode to adjust power and speed. This parameter can be a value of **COMP\_LL\_EC\_POWERMODE**This feature can be modified afterwards using unitary function **LL\_COMP\_SetPowerMode()**.
- ***uint32\_t LL\_COMP\_InitTypeDef::InputPlus***  
Set comparator input plus (non-inverting input). This parameter can be a value of **COMP\_LL\_EC\_INPUT\_PLUS**This feature can be modified afterwards using unitary function **LL\_COMP\_SetInputPlus()**.
- ***uint32\_t LL\_COMP\_InitTypeDef::InputMinus***  
Set comparator input minus (inverting input). This parameter can be a value of **COMP\_LL\_EC\_INPUT\_MINUS**This feature can be modified afterwards using unitary function **LL\_COMP\_SetInputMinus()**.
- ***uint32\_t LL\_COMP\_InitTypeDef::InputHysteresis***  
Set comparator hysteresis mode of the input minus. This parameter can be a value of **COMP\_LL\_EC\_INPUT\_HYSTERESIS**This feature can be modified afterwards using unitary function **LL\_COMP\_SetInputHysteresis()**.
- ***uint32\_t LL\_COMP\_InitTypeDef::OutputSelection***  
Set comparator output selection. This parameter can be a value of **COMP\_LL\_EC\_OUTPUT\_SELECTION**This feature can be modified afterwards using unitary function **LL\_COMP\_SetOutputSelection()**.
- ***uint32\_t LL\_COMP\_InitTypeDef::OutputPolarity***  
Set comparator output polarity. This parameter can be a value of **COMP\_LL\_EC\_OUTPUT\_POLARITY**This feature can be modified afterwards using unitary function **LL\_COMP\_SetOutputPolarity()**.
- ***uint32\_t LL\_COMP\_InitTypeDef::OutputBlankingSource***  
Set comparator blanking source. This parameter can be a value of **COMP\_LL\_EC\_OUTPUT\_BLANKING\_SOURCE**This feature can be modified afterwards using unitary function **LL\_COMP\_SetOutputBlankingSource()**.

## LL\_COMP\_SetInputMinus

Function name

**\_STATIC\_INLINE void LL\_COMP\_SetInputMinus  
(COMP\_TypeDef \* COMPx, uint32\_t InputMinus)**

Function description

Set comparator input minus (inverting).

Parameters

- COMPx:** Comparator instance
- InputMinus:** This parameter can be one of the following values:
  - LL\_COMP\_INPUT\_MINUS\_1\_4VREFINT
  - LL\_COMP\_INPUT\_MINUS\_1\_2VREFINT
  - LL\_COMP\_INPUT\_MINUS\_3\_4VREFINT
  - LL\_COMP\_INPUT\_MINUS\_VREFINT
  - LL\_COMP\_INPUT\_MINUS\_DAC1\_CH1
  - LL\_COMP\_INPUT\_MINUS\_DAC1\_CH2 (3)
  - LL\_COMP\_INPUT\_MINUS\_DAC2\_CH1 (2)
  - LL\_COMP\_INPUT\_MINUS\_IO1
  - LL\_COMP\_INPUT\_MINUS\_IO2
  - LL\_COMP\_INPUT\_MINUS\_IO3 (1)
  - LL\_COMP\_INPUT\_MINUS\_IO4 (1) Parameter available on all devices except STM32F301x6/8, STM32F318x8, STM32F302x6/8, STM32F303x6/8, STM32F328xx, STM32F334xx.
  - (2) Parameter available only on devices STM32F303x6/8, STM32F328x8, STM32F334xx.
  - (3) Parameter available on all devices except STM32F301x6/8, STM32F318x8, STM32F302xx.
  -

Return values

- None**

Notes

- In case of comparator input selected to be connected to IO: GPIO pins are specific to each comparator instance. Refer to description of parameters or to reference manual.
- On this STM32 serie, a voltage scaler is used when COMP input is based on VrefInt (VrefInt or subdivision of VrefInt): Voltage scaler requires a delay for voltage stabilization. Refer to device datasheet, parameter "tS\_SC".

### **LL\_COMP\_GetInputHysteresis**

Function name

**`__STATIC_INLINE uint32_t LL_COMP_GetInputHysteresis(  
(COMP_TypeDef * COMPx)`**

Function description

Get comparator instance hysteresis mode of the minus (inverting) input.

Parameters

- COMPx:** Comparator instance

Return values

- Returned:** value can be one of the following values: (1)  
Parameter available only on devices: STM32F302xB/C,  
STM32F303xB/C, STM32F358xC
  - LL\_COMP\_HYSTERESIS\_NONE
  - LL\_COMP\_HYSTERESIS\_LOW (1)
  - LL\_COMP\_HYSTERESIS\_MEDIUM (1)
  - LL\_COMP\_HYSTERESIS\_HIGH (1)

### **LL\_COMP\_SetOutputSelection**

Function name

**`__STATIC_INLINE void LL_COMP_SetOutputSelection(  
(COMP_TypeDef * COMPx, uint32_t OutputSelection)`**

Function description

Set comparator output selection.

Parameters

- COMPx:** Comparator instance
- OutputSelection:** This parameter can be one of the following values: (1) Parameter available on devices: STM32F302x8, STM32F318xx, STM32F303x8, STM32F328xx, STM32F334x8, STM32F302xC, STM32F302xE, STM32F303xC, STM32F358xx, STM32F303xE, STM32F398xx.

**COMP helper macro**

|                                |                     |
|--------------------------------|---------------------|
| <u>LL_COMP_COMMON_INSTANCE</u> | <b>Description:</b> |
|--------------------------------|---------------------|

- Helper macro to select the COMP common instance to which is belonging the selected COMP instance.

**Parameters:**

- COMPx: COMP instance

**Return value:**

- COMP: common instance or value "0" if there is no COMP common instance.

**Notes:**

- COMP common register instance can be used to set parameters common to several COMP instances. Refer to functions having argument "COMPxy\_COMMON" as parameter.

**Common write and read registers macro**

|                         |                     |
|-------------------------|---------------------|
| <u>LL_COMP_WriteReg</u> | <b>Description:</b> |
|-------------------------|---------------------|

- Write a value in COMP register.

**Parameters:**

- INSTANCE: comparator instance
- REG: Register to be written
- VALUE: Value to be written in the register

**Return value:**

- None

**LL\_COMP\_ReadReg****Description:**

- Read a value in COMP register.

**Parameters:**

- \_\_INSTANCE\_\_: comparator instance
- \_\_REG\_\_: Register to be read

**Return value:**

- Register: value

## 62 LL CORTEX Generic Driver

### 62.1 CORTEX Firmware driver API description

#### 62.1.1 Detailed description of functions

##### **LL\_SYSTICK\_IsActiveCounterFlag**

Function name **`__STATIC_INLINE uint32_t LL_SYSTICK_IsActiveCounterFlag(void)`**

Function description This function checks if the Systick counter flag is active or not.

Return values • **State:** of bit (1 or 0).

Notes • It can be used in timeout function on application side.

Reference Manual to  
LL API cross  
reference: • STK\_CTRL COUNTFLAG LL\_SYSTICK\_IsActiveCounterFlag

##### **LL\_SYSTICK\_SetClkSource**

Function name **`__STATIC_INLINE void LL_SYSTICK_SetClkSource(uint32_t Source)`**

Function description Configures the SysTick clock source.

Parameters • **Source:** This parameter can be one of the following values:  
– LL\_SYSTICK\_CLKSOURCE\_HCLK\_DIV8  
– LL\_SYSTICK\_CLKSOURCE\_HCLK

Return values • **None**

Reference Manual to  
LL API cross  
reference: • STK\_CTRL CLKSOURCE LL\_SYSTICK\_SetClkSource

##### **LL\_SYSTICK\_GetClkSource**

Function name **`__STATIC_INLINE uint32_t LL_SYSTICK_GetClkSource(void)`**

Function description Get the SysTick clock source.

Return values • **Returned:** value can be one of the following values:  
– LL\_SYSTICK\_CLKSOURCE\_HCLK\_DIV8  
– LL\_SYSTICK\_CLKSOURCE\_HCLK

Reference Manual to  
LL API cross  
reference: • STK\_CTRL CLKSOURCE LL\_SYSTICK\_GetClkSource

**LL\_SYSTICK\_EnableIT**

#### ***MPU Bufferable Access***

`LL_MPU_ACCESS_BUFFERABLE`      Bufferable memory attribute

`LL_MPU_ACCESS_NOT_BUFFERABLE`    Not Bufferable memory attribute

#### ***MPU Cacheable Access***

`LL_MPU_ACCESS_CACHEABLE`        Cacheable memory attribute

`LL_MPU_ACCESS_NOT_CACHEABLE`    Not Cacheable memory attribute

#### ***SYSTICK Clock Source***

`LL_SYSTICK_CLKSOURCE_HCLK_DIV8`   AHB clock divided by 8 selected as SysTick clock source.

`LL_SYSTICK_CLKSOURCE_HCLK`        AHB clock selected as SysTick clock source.

#### ***MPU Control***

`LL_MPU_CTRL_HFNMI_PRIVDEF_NONE`   Disable NMI and privileged SW access

|                                   |                                                                             |
|-----------------------------------|-----------------------------------------------------------------------------|
| LL_MPU_CTRL_HARDFAULT_NMI         | Enables the operation of MPU during hard fault, NMI, and FAULTMASK handlers |
| LL_MPU_CTRL_PRIVILEGED_DEFAULT    | Enable privileged software access to default memory map                     |
| LL_MPU_CTRL_HFNMI_PRIVDEF         | Enable NMI and privileged SW access                                         |
| <b>Handler Fault type</b>         |                                                                             |
| LL_HANDLER_FAULT_USG              | Usage fault                                                                 |
| LL_HANDLER_FAULT_BUS              | Bus fault                                                                   |
| LL_HANDLER_FAULT_MEM              | Memory management fault                                                     |
| <b>MPU Instruction Access</b>     |                                                                             |
| LL_MPU_INSTRUCTION_ACCESS_ENABLE  | Instruction fetches enabled                                                 |
| LL_MPU_INSTRUCTION_ACCESS_DISABLE | Instruction fetches disabled                                                |
| <b>MPU Region Number</b>          |                                                                             |
| LL_MPU_REGION_NUMBER0             | REGION Number 0                                                             |

| LL_MPU_REGION_SIZE_32B            | 32B Size of the MPU protection region                                       |
| LL_MPU_REGION_SIZE_64B            | 64B Size of the MPU protection region                                       |
| LL_MPU_REGION_SIZE_128B           | 128B Size of the MPU protection region                                      |
| LL_MPU_REGION_SIZE_256B           | 256B Size of the MPU protection region                                      |
| LL_MPU_REGION_SIZE_512B           | 512B Size of the MPU protection region                                      |
| LL_MPU_REGION_SIZE_1KB            | 1KB Size of the MPU protection region                                       |
| LL_MPU_REGION_SIZE_2KB            | 2KB Size of the MPU protection region                                       |

|                          |                                         |
|--------------------------|-----------------------------------------|
| LL_MPU_REGION_SIZE_4KB   | 4KB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_8KB   | 8KB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_16KB  | 16KB Size of the MPU protection region  |
| LL_MPU_REGION_SIZE_32KB  | 32KB Size of the MPU protection region  |
| LL_MPU_REGION_SIZE_64KB  | 64KB Size of the MPU protection region  |
| LL_MPU_REGION_SIZE_128KB | 128KB Size of the MPU protection region |
| LL_MPU_REGION_SIZE_256KB | 256KB Size of the MPU protection region |
| LL_MPU_REGION_SIZE_512KB | 512KB Size of the MPU protection region |
| LL_MPU_REGION_SIZE_1MB   | 1MB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_2MB   | 2MB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_4MB   | 4MB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_8MB   | 8MB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_16MB  | 16MB Size of the MPU protection region  |
| LL_MPU_REGION_SIZE_32MB  | 32MB Size of the MPU protection region  |
| LL_MPU_REGION_SIZE_64MB  | 64MB Size of the MPU protection region  |
| LL_MPU_REGION_SIZE_128MB | 128MB Size of the MPU protection region |
| LL_MPU_REGION_SIZE_256MB | 256MB Size of the MPU protection region |
| LL_MPU_REGION_SIZE_512MB | 512MB Size of the MPU protection region |
| LL_MPU_REGION_SIZE_1GB   | 1GB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_2GB   | 2GB Size of the MPU protection region   |
| LL_MPU_REGION_SIZE_4GB   | 4GB Size of the MPU protection region   |

***MPU Shareable Access***

|                             |                                |
|-----------------------------|--------------------------------|
| LL_MPU_ACCESS_SHAREABLE     | Shareable memory attribute     |
| LL_MPU_ACCESS_NOT_SHAREABLE | Not Shareable memory attribute |

***MPU TEX Level***

|                   |                   |
|-------------------|-------------------|
| LL_MPU_TEX_LEVEL0 | b000 for TEX bits |
| LL_MPU_TEX_LEVEL1 | b001 for TEX bits |
| LL_MPU_TEX_LEVEL2 | b010 for TEX bits |
| LL_MPU_TEX_LEVEL4 | b100 for TEX bits |

## 63 LL CRC Generic Driver

### 63.1 CRC Firmware driver API description

#### 63.1.1 Detailed description of functions

##### **LL\_CRC\_ResetCRCCalculationUnit**

Function name      **\_\_STATIC\_INLINE void LL\_CRC\_ResetCRCCalculationUnit(CRC\_TypeDef \* CRCx)**

Function description      Reset the CRC calculation unit.

Parameters      • **CRCx:** CRC Instance

Return values      • **None**

Notes      • If Programmable Initial CRC value feature is available, also set the Data Register to the value stored in the CRC\_INIT register, otherwise, reset Data Register to its default value.

Reference Manual to  
LL API cross  
reference:      • CR RESET LL\_CRC\_ResetCRCCalculationUnit

##### **LL\_CRC\_SetPolynomialSize**

Function name      **\_\_STATIC\_INLINE void LL\_CRC\_SetPolynomialSize(CRC\_TypeDef \* CRCx, uint32\_t PolySize)**

Function description      Configure size of the polynomial.

Parameters      • **CRCx:** CRC Instance

• **PolySize:** This parameter can be one of the following values:  
 – LL\_CRC\_POLYLENGTH\_32B  
 – LL\_CRC\_POLYLENGTH\_16B  
 – LL\_CRC\_POLYLENGTH\_8B  
 – LL\_CRC\_POLYLENGTH\_7B

Return values      • **None**

Reference Manual to  
LL API cross  
reference:      • CR POLYSIZE LL\_CRC\_SetPolynomialSize

##### **LL\_CRC\_GetPolynomialSize**

Function name      **\_\_STATIC\_INLINE uint32\_t LL\_CRC\_GetPolynomialSize(CRC\_TypeDef \* CRCx)**

Function description      Return size of the polynomial.

Parameters      • **CRCx:** CRC Instance

Return values      • **Returned:** value can be one of the following values:  
 – LL\_CRC\_POLYLENGTH\_32B  
 – LL\_CRC\_POLYLENGTH\_16B

- LL\_CRC\_POLYLENGTH\_8B
- LL\_CRC\_POLYLENGTH\_7B

Reference Manual to  
LL API cross  
reference:

- CR POLYSIZE LL\_CRC\_GetPolynomialSize

### **LL\_CRC\_SetInputDataReverseMode**

Function name      **\_\_STATIC\_INLINE void LL\_CRC\_SetInputDataReverseMode (CRC\_TypeDef \* CRCx, uint32\_t ReverseMode)**

Function description      Configure the reversal of the bit order of the input data.

- Parameters
- **CRCx:** CRC Instance
  - **ReverseMode:** This parameter can be one of the following values:
    - LL\_CRC\_INDATA\_REVERSE\_NONE
    - LL\_CRC\_INDATA\_REVERSE\_BYTE
    - LL\_CRC\_INDATA\_REVERSE\_HALFWORD
    - LL\_CRC\_INDATA\_REVERSE\_WORD

- Return values
- **None**

Reference Manual to  
LL API cross  
reference:

- CR REV\_IN LL\_CRC\_SetInputDataReverseMode

### **LL\_CRC\_GetInputDataReverseMode**

Function name      **\_\_STATIC\_INLINE uint32\_t LL\_CRC\_GetInputDataReverseMode (CRC\_TypeDef \* CRCx)**

Function description      Return type of reversal for input data bit order.

- Parameters
- **CRCx:** CRC Instance

- Return values
- **Returned:** value can be one of the following values:
    - LL\_CRC\_INDATA\_REVERSE\_NONE
    - LL\_CRC\_INDATA\_REVERSE\_BYTE
    - LL\_CRC\_INDATA\_REVERSE\_HALFWORD
    - LL\_CRC\_INDATA\_REVERSE\_WORD

Reference Manual to  
LL API cross  
reference:

- CR REV\_IN LL\_CRC\_GetInputDataReverseMode

### **LL\_CRC\_SetOutputDataReverseMode**

Function name      **\_\_STATIC\_INLINE void LL\_CRC\_SetOutputDataReverseMode (CRC\_TypeDef \* CRCx, uint32\_t ReverseMode)**

Function description      Configure the reversal of the bit order of the Output data.

- Parameters
- **CRCx:** CRC Instance
  - **ReverseMode:** This parameter can be one of the following values:
    - LL\_CRC\_OUTDATA\_REVERSE\_NONE
    - LL\_CRC\_OUTDATA\_REVERSE\_BIT

between Min\_Data=0 and Max\_Data=0xFFFFFFFF

Return values

- **None**
- DR DR LL\_CRC\_FeedData32

Reference Manual to  
LL API cross  
reference:

### **LL\_CRC\_FeedData16**

Function name

`__STATIC_INLINE void LL_CRC_FeedData16 (CRC_TypeDef *  
CRCx, uint16_t InData)`

Function description

Write given 16-bit data to the CRC calculator.

Parameters

- **CRCx:** CRC Instance
- **InData:** 16 bit value to be provided to CRC calculator  
between Min\_Data=0 and Max\_Data=0xFFFF

Return values

- **None**

Reference Manual to  
LL API cross  
reference:

- DR DR LL\_CRC\_FeedData16

### **LL\_CRC\_FeedData8**

Function name

`__STATIC_INLINE void LL_CRC_FeedData8 (CRC_TypeDef *  
CRCx, uint8_t InData)`

Function description

Write given 8-bit data to the CRC calculator.

Parameters

- **CRCx:** CRC Instance
- **InData:** 8 bit value to be provided to CRC calculator between  
Min\_Data=0 and Max\_Data=0xFF

Return values

- **None**

Reference Manual to  
LL API cross  
reference:

- DR DR LL\_CRC\_FeedData8

### **LL\_CRC\_ReadData32**

Function name

`__STATIC_INLINE uint32_t LL_CRC_ReadData32  
(CRC_TypeDef * CRCx)`

Function description

Return current CRC calculation result.

Parameters

- **CRCx:** CRC Instance

Return values

- **Current:** CRC calculation result as stored in CRC\_DR  
register (32 bits).

Reference Manual to  
LL API cross  
reference:

- DR DR LL\_CRC\_ReadData32

| <code>LL_CRC_OUTDATA_REVERSE_NONE</code> | Output Data bit order not affected   |
| <code>LL_CRC_OUTDATA_REVERSE_BIT</code>  | Output Data bit reversal done by bit |

***Polynomial length***

|                                    |                         |
|------------------------------------|-------------------------|
| <code>LL_CRC_POLYLENGTH_32B</code> | 32 bits Polynomial size |
| <code>LL_CRC_POLYLENGTH_16B</code> | 16 bits Polynomial size |
| <code>LL_CRC_POLYLENGTH_8B</code>  | 8 bits Polynomial size  |
| <code>LL_CRC_POLYLENGTH_7B</code>  | 7 bits Polynomial size  |

***Common Write and read registers Macros***

`LL_CRC_WriteReg`      **Description:**

- Write a value in CRC register.

**Parameters:**

- `_INSTANCE_`: CRC Instance
- `_REG_`: Register to be written
- `_VALUE_`: Value to be written in the register

**Return value:**

- None

`LL_CRC_ReadReg`      **Description:**

- Read a value in CRC register.

**Parameters:**

- `_INSTANCE_`: CRC Instance
- `_REG_`: Register to be read

**Return value:**

- Register: value

## 64 LL DAC Generic Driver

### 64.1 DAC Firmware driver registers structures

#### 64.1.1 LL\_DAC\_InitTypeDef

##### Data Fields

- *uint32\_t TriggerSource*
- *uint32\_t WaveAutoGeneration*
- *uint32\_t WaveAutoGenerationConfig*
- *uint32\_t OutputBuffer*

##### Field Documentation

- ***uint32\_t LL\_DAC\_InitTypeDef::TriggerSource***  
Set the conversion trigger source for the selected DAC channel: internal (SW start) or from external IP (timer event, external interrupt line). This parameter can be a value of **DAC\_LL\_EC\_TRIGGER\_SOURCE** This feature can be modified afterwards using unitary function **LL\_DAC\_SetTriggerSource()**.
- ***uint32\_t LL\_DAC\_InitTypeDef::WaveAutoGeneration***  
Set the waveform automatic generation mode for the selected DAC channel. This parameter can be a value of **DAC\_LL\_EC\_WAVE\_AUTO\_GENERATION\_MODE** This feature can be modified afterwards using unitary function **LL\_DAC\_SetWaveAutoGeneration()**.
- ***uint32\_t LL\_DAC\_InitTypeDef::WaveAutoGenerationConfig***  
Set the waveform automatic generation mode for the selected DAC channel. If waveform automatic generation mode is set to noise, this parameter can be a value of **DAC\_LL\_EC\_WAVE\_NOISE\_LFSR\_UNMASK\_BITS** If waveform automatic generation mode is set to triangle, this parameter can be a value of **DAC\_LL\_EC\_WAVE\_TRIANGLE\_AMPLITUDE**  
**Note:**If waveform automatic generation mode is disabled, this parameter is discarded. This feature can be modified afterwards using unitary function **LL\_DAC\_SetWaveNoiseLFSR()** or **LL\_DAC\_SetWaveTriangleAmplitude()**, depending on the wave automatic generation selected.
- ***uint32\_t LL\_DAC\_InitTypeDef::OutputBuffer***  
Set the output buffer for the selected DAC channel. This parameter can be a value of **DAC\_LL\_EC\_OUTPUT\_BUFFER** This feature can be modified afterwards using unitary function **LL\_DAC\_SetOutputBuffer()**.

### 64.2 DAC Firmware driver API description

#### 64.2.1 Detailed description of functions

##### LL\_DAC\_SetTriggerSource

Function name      **\_STATIC\_INLINE void LL\_DAC\_SetTriggerSource  
(DAC\_TypeDef \* DACx, uint32\_t DAC\_Channel, uint32\_t  
TriggerSource)**

Function description      Set the conversion trigger source for the selected DAC channel.

Parameters     
 

- **DACx:** DAC instance
- **DAC\_Channel:** This parameter can be one of the following

values: (1) On this STM32 serie, parameter not available on all devices. Refer to device datasheet for channels availability.

- LL\_DAC\_CHANNEL\_1
- LL\_DAC\_CHANNEL\_2 (1)

- **TriggerSource:** This parameter can be one of the following values: (1) On STM32F3, parameter not available on all devices (2) On STM32F3, parameter not available on all DAC instances: DAC1 (for DAC instances DACx available on the selected device).
  - LL\_DAC\_TRIG\_SOFTWARE
  - LL\_DAC\_TRIG\_EXT\_TIM2\_TRGO
  - LL\_DAC\_TRIG\_EXT\_TIM3\_TRGO (1)
  - LL\_DAC\_TRIG\_EXT\_TIM4\_TRGO (1)
  - LL\_DAC\_TRIG\_EXT\_TIM5\_TRGO (1)
  - LL\_DAC\_TRIG\_EXT\_TIM6\_TRGO
  - LL\_DAC\_TRIG\_EXT\_TIM7\_TRGO (1)
  - LL\_DAC\_TRIG\_EXT\_TIM8\_TRGO (1)
  - LL\_DAC\_TRIG\_EXT\_TIM15\_TRGO (1)
  - LL\_DAC\_TRIG\_EXT\_TIM18\_TRGO (1)
  - LL\_DAC\_TRIG\_EXT\_HRTIM1\_DACTRG1 (1)
  - LL\_DAC\_TRIG\_EXT\_HRTIM1\_DACTRG2 (1)(2)
  - LL\_DAC\_TRIG\_EXT\_HRTIM1\_DACTRG3 (1) (3)
  - LL\_DAC\_TRIG\_EXT EXTI\_LINE9
- (3) On STM32F3, parameter not available on all DAC instances: DAC2 (for DAC instances DACx available on the selected device).

#### Return values

- **None**

#### Notes

- For conversion trigger source to be effective, DAC trigger must be enabled using function `LL_DAC_EnableTrigger()`.
- To set conversion trigger source, DAC channel must be disabled. Otherwise, the setting is discarded.
- Availability of parameters of trigger sources from timer depends on timers availability on the selected device.

#### Reference Manual to LL API cross reference:

- CR TSEL1 `LL_DAC_SetTriggerSource`
- CR TSEL2 `LL_DAC_SetTriggerSource`

## **LL\_DAC\_GetTriggerSource**

#### Function name

```
__STATIC_INLINE uint32_t LL_DAC_GetTriggerSource
(DAC_TypeDef * DACx, uint32_t DAC_Channel)
```

#### Function description

Get the conversion trigger source for the selected DAC channel.

#### Parameters

- **DACx:** DAC instance
- **DAC\_Channel:** This parameter can be one of the following values: (1) On this STM32 serie, parameter not available on all devices. Refer to device datasheet for channels availability.
  - LL\_DAC\_CHANNEL\_1
  - LL\_DAC\_CHANNEL\_2 (1)

### **LL\_DAC\_GetWaveAutoGeneration**

Function name

**\_STATIC\_INLINE uint32\_t LL\_DAC\_GetWaveAutoGeneration  
(DAC\_TypeDef \* DACx, uint32\_t DAC\_Channel)**

Function description

Get the waveform automatic generation mode for the selected DAC channel.

Parameters

- **DACx:** DAC instance
- **DAC\_Channel:** This parameter can be one of the following values: (1) On this STM32 serie, parameter not available on all devices. Refer to device datasheet for channels availability.
  - LL\_DAC\_CHANNEL\_1
  - LL\_DAC\_CHANNEL\_2 (1)

Return values

- **Returned:** value can be one of the following values:
  - LL\_DAC\_WAVE\_AUTO\_GENERATION\_NONE
  - LL\_DAC\_WAVE\_AUTO\_GENERATION\_NOISE
  - LL\_DAC\_WAVE\_AUTO\_GENERATION\_TRIANGLE

### **LL\_DAC\_SetWaveNoiseLFSR**

Function name

**\_STATIC\_INLINE void LL\_DAC\_SetWaveNoiseLFSR  
(DAC\_TypeDef \* DACx, uint32\_t DAC\_Channel, uint32\_t  
NoiseLFSRMask)**

Function description

Set the noise waveform generation for the selected DAC channel:  
Noise mode and parameters LFSR (linear feedback shift register).

Parameters

- **DACx:** DAC instance
- **DAC\_Channel:** This parameter can be one of the following values: (1) On this STM32 serie, parameter not available on all devices. Refer to device datasheet for channels availability.
  - LL\_DAC\_CHANNEL\_1
  - LL\_DAC\_CHANNEL\_2 (1)
- **NoiseLFSRMask:** This parameter can be one of the following values:
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BIT0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS1\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS2\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS3\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS4\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS5\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS6\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS7\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS8\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS9\_0
  - LL\_DAC\_NOISE\_LFSR\_UNMASK\_BITS10\_0

### LL\_DAC\_SetWaveTriangleAmplitude

|                      |                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b><u>__STATIC_INLINE void LL_DAC_SetWaveTriangleAmplitude(DAC_TypeDef * DACx, uint32_t DAC_Channel, uint32_t TriangleAmplitude)</u></b> |
| Function description | Set the triangle waveform generation for the selected DAC channel: triangle mode and amplitude.                                          |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>DACx:</b> DAC instance</li> </ul>                                                            |

- **DAC\_Channel:** This parameter can be one of the following values: (1) On this STM32 serie, parameter not available on all devices. Refer to device datasheet for channels availability.
    - LL\_DAC\_CHANNEL\_1
    - LL\_DAC\_CHANNEL\_2 (1)
  - **TriangleAmplitude:** This parameter can be one of the following values:
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_1
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_3
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_7
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_15
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_31
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_63
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_127
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_255
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_511
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_1023
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_2047
    - LL\_DAC\_TRIANGLE\_AMPLITUDE\_4095
- Return values**
- **None**
- Notes**
- For wave generation to be effective, DAC channel wave generation mode must be enabled using function `LL_DAC_SetWaveAutoGeneration()`.
  - This setting can be set when the selected DAC channel is disabled (otherwise, the setting operation is ignored).
- Reference Manual to LL API cross reference:**

|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <code>void LL_DAC_StructInit (LL_DAC_InitTypeDef * DAC_InitStruct)</code>                                                                                      |
| Function description | Set each LL_DAC_InitTypeDef field to default value.                                                                                                            |
| Parameters           | <ul style="list-style-type: none"> <li><b>DAC_InitStruct:</b> pointer to a LL_DAC_InitTypeDef structure whose fields will be set to default values.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>None</b></li> </ul>                                                                                                  |

## 64.3 DAC Firmware driver defines

### 64.3.1 DAC

#### *DAC channels*

`LL_DAC_CHANNEL_1` DAC channel 1

`LL_DAC_CHANNEL_2` DAC channel 2

#### *DAC flags*

`LL_DAC_FLAG_DMAUDR1` DAC channel 1 flag DMA underrun

`LL_DAC_FLAG_DMAUDR2` DAC channel 2 flag DMA underrun

#### *Definitions of DAC hardware constraints delays*

`LL_DAC_DELAY_STARTUP_VOLTAGE_SETTLING_US` Delay for DAC channel voltage settling time from DAC channel startup (transition from disable to enable)

`LL_DAC_DELAY_VOLTAGE_SETTLING_US` Delay for DAC channel voltage settling time

#### *DAC interruptions*

`LL_DAC_IT_DMAUDRIE1` DAC channel 1 interruption DMA underrun

`LL_DAC_IT_DMAUDRIE2` DAC channel 2 interruption DMA underrun

#### *DAC channel output buffer*

`LL_DAC_OUTPUT_BUFFER_ENABLE` The selected DAC channel output is buffered: higher drive current capability, but also higher current consumption

`LL_DAC_OUTPUT_BUFFER_DISABLE` The selected DAC channel output is not buffered: lower drive current capability, but also lower current consumption

***DAC registers compliant with specific purpose***

|                                          |                                                         |
|------------------------------------------|---------------------------------------------------------|
| LL_DAC_DMA_REG_DATA_12BITS_RIGHT_ALIGNED | DAC channel data holding register 12 bits right aligned |
| LL_DAC_DMA_REG_DATA_12BITS_LEFT_ALIGNED  | DAC channel data holding register 12 bits left aligned  |
| LL_DAC_DMA_REG_DATA_8BITS_RIGHT_ALIGNED  | DAC channel data holding register 8 bits right aligned  |

***DAC channel output resolution***

|                       |                                |
|-----------------------|--------------------------------|
| LL_DAC_RESOLUTION_12B | DAC channel resolution 12 bits |
| LL_DAC_RESOLUTION_8B  | DAC channel resolution 8 bits  |

***DAC trigger source***

|                            |                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LL_DAC_TRIG_SOFTWARE       | DAC channel conversion trigger internal (SW start)                                                                                                                                                 |
| LL_DAC_TRIG_EXT_TIM6_TRGO  | DAC channel conversion trigger from external IP: TIM6 TRGO.                                                                                                                                        |
| LL_DAC_TRIG_EXT_TIM3_TRGO  | DAC channel conversion trigger from external IP: TIM3 TRGO. Trigger remap: by default, default trigger. If needed to restore trigger, use LL_SYSCFG_DAC1_TRIG1_REMAP_TIM3_TRGO for TIM3 selection. |
| LL_DAC_TRIG_EXT_TIM7_TRGO  | DAC channel conversion trigger from external IP: TIM7 TRGO.                                                                                                                                        |
| LL_DAC_TRIG_EXT_TIM15_TRGO | DAC channel conversion trigger from external IP: TIM5 TRGO.                                                                                                                                        |
| LL_DAC_TRIG_EXT_TIM2_TRGO  | DAC channel conversion trigger from external IP: TIM2 TRGO.                                                                                                                                        |
| LL_DAC_TRIG_EXT_TIM4_TRGO  | DAC channel conversion trigger from external IP: TIM4 TRGO.                                                                                                                                        |
| LL_DAC_TRIG_EXT_TIM8_TRGO  | DAC channel conversion trigger from external IP: TIM8 TRGO. Trigger remap: use LL_SYSCFG_DAC1_TRIG1_REMAP_TIM8_TRGO for TIM8 selection.                                                            |
| LL_DAC_TRIG_EXT EXTI_LINE9 | DAC channel conversion trigger from external IP: external interrupt line 9.                                                                                                                        |

***DAC waveform automatic generation mode***

|                                      |                                                                                 |
|--------------------------------------|---------------------------------------------------------------------------------|
| LL_DAC_WAVE_AUTO_GENERATION_NONE     | DAC channel wave auto generation mode disabled.                                 |
| LL_DAC_WAVE_AUTO_GENERATION_NOISE    | DAC channel wave auto generation mode enabled, set generated noise waveform.    |
| LL_DAC_WAVE_AUTO_GENERATION_TRIANGLE | DAC channel wave auto generation mode enabled, set generated triangle waveform. |

**DAC wave generation - Noise LFSR unmask bits**

|                                   |                                                                             |
|-----------------------------------|-----------------------------------------------------------------------------|
| LL_DAC_NOISE_LFSR_UNMASK_BIT0     | Noise wave generation, unmask LFSR bit0, for the selected DAC channel       |
| LL_DAC_NOISE_LFSR_UNMASK_BITS1_0  | Noise wave generation, unmask LFSR bits[1:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS2_0  | Noise wave generation, unmask LFSR bits[2:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS3_0  | Noise wave generation, unmask LFSR bits[3:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS4_0  | Noise wave generation, unmask LFSR bits[4:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS5_0  | Noise wave generation, unmask LFSR bits[5:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS6_0  | Noise wave generation, unmask LFSR bits[6:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS7_0  | Noise wave generation, unmask LFSR bits[7:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS8_0  | Noise wave generation, unmask LFSR bits[8:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS9_0  | Noise wave generation, unmask LFSR bits[9:0], for the selected DAC channel  |
| LL_DAC_NOISE_LFSR_UNMASK_BITS10_0 | Noise wave generation, unmask LFSR bits[10:0], for the selected DAC channel |
| LL_DAC_NOISE_LFSR_UNMASK_BITS11_0 | Noise wave generation, unmask LFSR bits[11:0], for the selected DAC channel |

**DAC wave generation - Triangle amplitude**

|                               |                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------|
| LL_DAC_TRIANGLE_AMPLITUDE_1   | Triangle wave generation, amplitude of 1 LSB of DAC output range, for the selected DAC channel  |
| LL_DAC_TRIANGLE_AMPLITUDE_3   | Triangle wave generation, amplitude of 3 LSB of DAC output range, for the selected DAC channel  |
| LL_DAC_TRIANGLE_AMPLITUDE_7   | Triangle wave generation, amplitude of 7 LSB of DAC output range, for the selected DAC channel  |
| LL_DAC_TRIANGLE_AMPLITUDE_15  | Triangle wave generation, amplitude of 15 LSB of DAC output range, for the selected DAC channel |
| LL_DAC_TRIANGLE_AMPLITUDE_31  | Triangle wave generation, amplitude of 31 LSB of DAC output range, for the selected DAC channel |
| LL_DAC_TRIANGLE_AMPLITUDE_63  | Triangle wave generation, amplitude of 63 LSB of DAC output range, for the selected DAC channel |
| LL_DAC_TRIANGLE_AMPLITUDE_127 | Triangle wave generation, amplitude of 127                                                      |

|                                |                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------|
|                                | LSB of DAC output range, for the selected DAC channel                                                |
| LL_DAC_TRIANGLE_AMPLITUDE_255  | Triangle wave generation, amplitude of 255<br>LSB of DAC output range, for the selected DAC channel  |
| LL_DAC_TRIANGLE_AMPLITUDE_511  | Triangle wave generation, amplitude of 512<br>LSB of DAC output range, for the selected DAC channel  |
| LL_DAC_TRIANGLE_AMPLITUDE_1023 | Triangle wave generation, amplitude of 1023<br>LSB of DAC output range, for the selected DAC channel |
| LL_DAC_TRIANGLE_AMPLITUDE_2047 | Triangle wave generation, amplitude of 2047<br>LSB of DAC output range, for the selected DAC channel |
| LL_DAC_TRIANGLE_AMPLITUDE_4095 | Triangle wave generation, amplitude of 4095<br>LSB of DAC output range, for the selected DAC channel |

**DAC helper macro**\_LL\_DAC\_CHANNEL\_TO\_DECIMAL\_NB**Description:**

- Helper macro to get DAC channel number in decimal format from literals LL\_DAC\_CHANNEL\_x.

**Parameters:**

- \_\_CHANNEL\_\_: This parameter can be one of the following values:
  - LL\_DAC\_CHANNEL\_1
  - LL\_DAC\_CHANNEL\_2 (1)

**Return value:**

- 1...2: (value "2" depending on DAC channel 2 availability)

**Notes:**

- The input can be a value from functions where a channel number is returned.

\_LL\_DAC\_DECIMAL\_NB\_TO\_CHANNEL**Description:**

- Helper macro to get DAC channel in literal format LL\_DAC\_CHANNEL\_x from number in decimal format.

**Parameters:**

- \_\_DECIMAL\_NB\_\_: 1...2 (value "2" depending on DAC channel 2 availability)

**Return value:**

- Returned: value can be one of the following values:
  - LL\_DAC\_CHANNEL\_1

- LL\_DAC\_CHANNEL\_2 (1)

**Notes:**

- If the input parameter does not correspond to a DAC channel, this macro returns value '0'.

### \_\_LL\_DAC\_DIGITAL\_SCALE

**Description:**

- Helper macro to define the DAC conversion data full-scale digital value corresponding to the selected DAC resolution.

**Parameters:**

- \_\_DAC\_RESOLUTION\_\_: This parameter can be one of the following values:
  - LL\_DAC\_RESOLUTION\_12B
  - LL\_DAC\_RESOLUTION\_8B

**Return value:**

- ADC: conversion data equivalent voltage value (unit: mVolt)

**Notes:**

- DAC conversion data full-scale corresponds to voltage range determined by analog voltage references Vref+ and Vref- (refer to reference manual).

### \_\_LL\_DAC\_CALC\_VOLTAGE\_TO\_DATA

**Description:**

- Helper macro to calculate the DAC conversion data (unit: digital value) corresponding to a voltage (unit: mVolt).

**Parameters:**

- \_\_VREFANALOG\_VOLTAGE\_\_: Analog reference voltage (unit: mV)
- \_\_DAC\_VOLTAGE\_\_: Voltage to be generated by DAC channel (unit: mVolt).
- \_\_DAC\_RESOLUTION\_\_: This parameter can be one of the following values:
  - LL\_DAC\_RESOLUTION\_12B
  - LL\_DAC\_RESOLUTION\_8B

**Return value:**

- DAC: conversion data (unit: digital value)

**Notes:**

- This helper macro is intended to provide input data in voltage rather than digital value, to be used with LL DAC functions such as LL\_DAC\_ConvertData12RightAligned(). Analog reference voltage (Vref+) must be

either known from user board environment or can be calculated using ADC measurement and ADC helper macro  
`__LL_ADC_CALC_VREFANALOG_VOLTAGE()`.

#### ***Common write and read registers macros***

`LL_DAC_WriteReg`

##### **Description:**

- Write a value in DAC register.

##### **Parameters:**

- `__INSTANCE__`: DAC Instance
- `__REG__`: Register to be written
- `__VALUE__`: Value to be written in the register

##### **Return value:**

- None

`LL_DAC_ReadReg`

##### **Description:**

- Read a value in DAC register.

##### **Parameters:**

- `__INSTANCE__`: DAC Instance
- `__REG__`: Register to be read

##### **Return value:**

- Register: value

## 65 LL DMA Generic Driver

### 65.1 DMA Firmware driver registers structures

#### 65.1.1 LL\_DMA\_InitTypeDef

##### Data Fields

- *uint32\_t PeriphOrM2MSrcAddress*
- *uint32\_t MemoryOrM2MDstAddress*
- *uint32\_t Direction*
- *uint32\_t Mode*
- *uint32\_t PeriphOrM2MSrcIncMode*
- *uint32\_t MemoryOrM2MDstIncMode*
- *uint32\_t PeriphOrM2MSrcDataSize*
- *uint32\_t MemoryOrM2MDstDataSize*
- *uint32\_t NbData*
- *uint32\_t Priority*

##### Field Documentation

- ***uint32\_t LL\_DMA\_InitTypeDef::PeriphOrM2MSrcAddress***  
Specifies the peripheral base address for DMA transfer or as Source base address in case of memory to memory transfer direction. This parameter must be a value between Min\_Data = 0 and Max\_Data = 0xFFFFFFFF.
- ***uint32\_t LL\_DMA\_InitTypeDef::MemoryOrM2MDstAddress***  
Specifies the memory base address for DMA transfer or as Destination base address in case of memory to memory transfer direction. This parameter must be a value between Min\_Data = 0 and Max\_Data = 0xFFFFFFFF.
- ***uint32\_t LL\_DMA\_InitTypeDef::Direction***  
Specifies if the data will be transferred from memory to peripheral, from memory to memory or from peripheral to memory. This parameter can be a value of **DMA\_LL\_EC\_DIRECTION** This feature can be modified afterwards using unitary function **LL\_DMA\_SetDataTransferDirection()**.
- ***uint32\_t LL\_DMA\_InitTypeDef::Mode***  
Specifies the normal or circular operation mode. This parameter can be a value of **DMA\_LL\_EC\_MODE**  
**Note:** The circular buffer mode cannot be used if the memory to memory data transfer direction is configured on the selected Channel This feature can be modified afterwards using unitary function **LL\_DMA\_SetMode()**.
- ***uint32\_t LL\_DMA\_InitTypeDef::PeriphOrM2MSrcIncMode***  
Specifies whether the Peripheral address or Source address in case of memory to memory transfer direction is incremented or not. This parameter can be a value of **DMA\_LL\_EC\_PERIPH** This feature can be modified afterwards using unitary function **LL\_DMA\_SetPeriphIncMode()**.
- ***uint32\_t LL\_DMA\_InitTypeDef::MemoryOrM2MDstIncMode***  
Specifies whether the Memory address or Destination address in case of memory to memory transfer direction is incremented or not. This parameter can be a value of **DMA\_LL\_EC\_MEMORY** This feature can be modified afterwards using unitary function **LL\_DMA\_SetMemoryIncMode()**.
- ***uint32\_t LL\_DMA\_InitTypeDef::PeriphOrM2MSrcDataSize***  
Specifies the Peripheral data size alignment or Source data size alignment (byte, half word, word) in case of memory to memory transfer direction. This parameter can be a

- value of **DMA\_LL\_EC\_PDATAALIGN**This feature can be modified afterwards using unitary function **LL\_DMA\_SetPeriphSize()**.
- **uint32\_t LL\_DMA\_InitTypeDef::MemoryOrM2MDstDataSize**  
Specifies the Memory data size alignment or Destination data size alignment (byte, half word, word) in case of memory to memory transfer direction. This parameter can be a value of **DMA\_LL\_EC\_MDATAALIGN**This feature can be modified afterwards using unitary function **LL\_DMA\_SetMemorySize()**.
  - **uint32\_t LL\_DMA\_InitTypeDef::NbData**  
Specifies the number of data to transfer, in data unit. The data unit is equal to the source buffer configuration set in PeripheralSize or MemorySize parameters depending in the transfer direction. This parameter must be a value between Min\_Data = 0 and Max\_Data = 0x0000FFFFThis feature can be modified afterwards using unitary function **LL\_DMA\_SetDataLength()**.
  - **uint32\_t LL\_DMA\_InitTypeDef::Priority**  
Specifies the channel priority level. This parameter can be a value of **DMA\_LL\_EC\_PRIORITY**This feature can be modified afterwards using unitary function **LL\_DMA\_SetChannelPriorityLevel()**.

## 65.2 DMA Firmware driver API description

### 65.2.1 Detailed description of functions

### **LL\_DMA\_SetDataTransferDirection**

Function name

```
STATIC_INLINE void LL_DMA_SetDataTransferDirection
(DMA_TypeDef * DMAx, uint32_t Channel, uint32_t Direction)
```

Function description

Set Data transfer direction (read from peripheral or from memory).

Parameters

- **DMAx:** DMAx Instance
- **Channel:** This parameter can be one of the following values:
  - LL\_DMA\_CHANNEL\_1
  - LL\_DMA\_CHANNEL\_2
  - LL\_DMA\_CHANNEL\_3
  - LL\_DMA\_CHANNEL\_4
  - LL\_DMA\_CHANNEL\_5
  - LL\_DMA\_CHANNEL\_6
  - LL\_DMA\_CHANNEL\_7
- **Direction:** This parameter can be one of the following values:
  - LL\_DMA\_DIRECTION\_PERIPH\_TO\_MEMORY
  - LL\_DMA\_DIRECTION\_MEMORY\_TO\_PERIPH
  - LL\_DMA\_DIRECTION\_MEMORY\_TO\_MEMORY

Return values

- **None**
