

Description of STM32F3 HAL and low-layer drivers

Introduction

STMCube™ is an STMicroelectronics original initiative to make developers' lives easier by reducing development effort, time and cost. STM32Cube covers the whole STM32 portfolio.

STM32Cube Version 1.x includes:

- STM32CubeMX, a graphical software configuration tool that allows the generation of C initialization code using graphical wizards.
- A comprehensive embedded software platform, delivered per Series (such as STM32CubeF3 for STM32F3 Series).
 - The STM32Cube HAL, STM32 abstraction layer embedded software ensuring maximized portability across the STM32 portfolio
 - Low-layer APIs (LL) offering a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. LL APIs are available only for a set of peripherals.
 - A consistent set of middleware components such as RTOS, USB, TCP/IP, Graphics
 - All embedded software utilities, delivered with a full set of examples.

The HAL driver layer provides a generic multiinstance simple set of APIs (application programming interfaces) to interact with the upper layer (application, libraries and stacks).

The HAL driver APIs are split into two categories: generic APIs which provide common and generic functions for all the STM32 series, and extension APIs which include specific and customized functions for a given line or part number. The HAL drivers include a complete set of ready-to-use APIs which simplify the user application implementation. As an example, the communication peripherals contain APIs to initialize and configure the peripheral, manage data transfers in polling mode, handle interrupts or DMA, and manage communication errors.

The HAL drivers are feature-oriented instead of IP-oriented. As an example, the timer APIs are split into several categories following the functions offered by the IP such as basic timer, capture, or pulse width modulation (PWM). The HAL driver layer implements run-time failure detection by checking the input values of all functions. Such dynamic checking contributes to enhance the firmware robustness. Run-time detection is also suitable for user application development and debugging.

The LL drivers offer hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities and provide atomic operations that must be called following the programming model described in the product line reference manual. As a result, the LL services are not based on standalone processes and do not require any additional memory resources to save their states, counter or data pointers: all operations are performed by changing the associated peripheral registers content. Contrary to the HAL, the LL APIs are not provided for peripherals for which optimized access is not a key feature, or for those requiring heavy software configuration and/or complex upper level stack (such as FSMC or USB).

The HAL and LL drivers are complementary and cover a wide range of applications requirements:

- The HAL offers high-level and feature-oriented APIs, with a high-portability level. They hide the MCU and peripheral complexity to end-user.
- The LL offers low-level APIs at registers level, with better optimization but less portability. They require deep knowledge of the MCU and peripherals specifications.

HAL and LL source code is developed in Strict ANSI-C which makes it independent from the development tools. It is checked with CodeSonar™ static analysis tool. It is fully documented and is MISRA-C 2004 compliant.

1 Acronyms and definitions

Table 1: Acronyms and definitions

Acronym	Definition
ADC	Analog-to-digital converter
ANSI	American National Standards Institute
API	Application Programming Interface
BSP	Board Support Package
COMP	Comparator
CMSIS	Cortex Microcontroller Software Interface Standard
CPU	Central Processing Unit
CRYP	Cryptographic processor unit
CRC	CRC calculation unit
DAC	Digital to analog converter
DMA	Direct Memory Access
EXTI	External interrupt/event controller
FLASH	Flash memory
FMC	Flexible Memory Controller
GPIO	General purpose I/Os
HAL	Hardware abstraction layer
HRTIM	High Resolution Timer
I2C	Inter-integrated circuit
I2S	Inter-integrated sound
IRDA	InfraRed Data Association
IWDG	Independent watchdog
LCD	Liquid Crystal Display Controller
MSP	MCU Specific Package
NAND	NAND Flash memory
NOR	NOR Flash memory
NVIC	Nested Vectored Interrupt Controller
PCD	USB Peripheral Controller Driver
PWR	Power controller
RCC	Reset and clock controller
RNG	Random Number Generator
RTC	Real-time clock
SD	Secure Digital
SDADC	Sigma-delta Analog-to-digital Converter
SRAM	SRAM external memory

Acronym	Definition
SMARTCARD	Smartcard IC
SPI	Serial Peripheral interface
SysTick	System tick timer
TIM	Advanced-control, general-purpose or basic timer
TSC	Touch Sensing Controller
UART	Universal asynchronous receiver/transmitter
USART	Universal synchronous receiver/transmitter
WWDG	Window watchdog
USB	Universal Serial Bus
PPP	STM32 peripheral or block

2 Overview of HAL drivers

The HAL drivers were designed to offer a rich set of APIs and to interact easily with the application upper layers.

Each driver consists of a set of functions covering the most common peripheral features. The development of each driver is driven by a common API which standardizes the driver structure, the functions and the parameter names.

The HAL drivers include a set of driver modules, each module being linked to a standalone peripheral. However, in some cases, the module is linked to a peripheral functional mode. As an example, several modules exist for the USART peripheral: USART driver module, USART driver module, SMARTCARD driver module and IRDA driver module.

The HAL main features are the following:

- Cross-family portable set of APIs covering the common peripheral features as well as extension APIs in case of specific peripheral features.
- Three API programming models: polling, interrupt and DMA.
- APIs are RTOS compliant:
 - Fully reentrant APIs
 - Systematic usage of timeouts in polling mode.
- Support of peripheral multi-instance allowing concurrent API calls for multiple instances of a given peripheral (USART1, USART2...)
- All HAL APIs implement user-callback functions mechanism:
 - Peripheral Init/DeInit HAL APIs can call user-callback functions to perform peripheral system level Initialization/De-Initialization (clock, GPIOs, interrupt, DMA)
 - Peripherals interrupt events
 - Error events.
- Object locking mechanism: safe hardware access to prevent multiple spurious accesses to shared resources.
- Timeout used for all blocking processes: the timeout can be a simple counter or a timebase.

2.1 HAL and user-application files

2.1.1 HAL driver files

A HAL drivers are composed of the following set of files:

Table 2: HAL driver files

File	Description
<i>stm32f3xx_hal_ppp.c</i>	Main peripheral/module driver file. It includes the APIs that are common to all STM32 devices. <i>Example: stm32f3xx_hal_adc.c, stm32f3xx_hal_irda.c, ...</i>
<i>stm32xx_hal_ppp.h</i>	Header file of the main driver C file It includes common data, handle and enumeration structures, define statements and macros, as well as the exported generic APIs. <i>Example: stm32xx_hal_adc.h, stm32xx_hal_irda.h, ...</i>

File	Description
<i>stm32xx_hal_ppp_ex.c</i>	Extension file of a peripheral/module driver. It includes the specific APIs for a given part number or family, as well as the newly defined APIs that overwrite the default generic APIs if the internal process is implemented in different way. <i>Example: stm32xx_hal_adc_ex.c, stm32xx_hal_dma_ex.c, ...</i>
<i>stm32xx_hal_ppp_ex.h</i>	Header file of the extension C file. It includes the specific data and enumeration structures, define statements and macros, as well as the exported device part number specific APIs <i>Example: stm32xx_hal_adc_ex.h, stm32xx_hal_dma_ex.h, ...</i>
<i>stm32xx_hal.c</i>	This file is used for HAL initialization and contains DBGMCU, Remap and Time Delay based on systick APIs.
<i>stm32xx_hal.h</i>	xx_hal.c header file
<i>stm32xx_hal_msp_template.c</i>	Template file to be copied to the user application folder. It contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.
<i>stm32xx_hal_conf_template.h</i>	Template file allowing to customize the drivers for a given application.
<i>stm32xx_hal_def.h</i>	Common HAL resources such as common define statements, enumerations, structures and macros.

2.1.2 User-application files

The minimum files required to build an application using the HAL are listed in the table below:

Table 3: User-application files

File	Description
<i>system_stm32f3xx.c</i>	This file contains SystemInit() which is called at startup just after reset and before branching to the main program. It does not configure the system clock at startup (contrary to the standard library). This is to be done using the HAL APIs in the user files. It allows relocating the vector table in internal SRAM.
<i>startup_stm32f3xx.s</i>	Toolchain specific file that contains reset handler and exception vectors. For some toolchains, it allows adapting the stack/heap size to fit the application requirements.
<i>stm32f3xx_flash.icf (optional)</i>	Linker file for EWARM toolchain allowing mainly to adapt the stack/heap size to fit the application requirements.
<i>stm32f3xx_hal_msp.c</i>	This file contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.
<i>stm32f3xx_hal_conf.h</i>	This file allows the user to customize the HAL drivers for a specific application. It is not mandatory to modify this configuration. The application can use the default configuration without any modification.

File	Description
<i>stm32f3xx_it.c/h</i>	This file contains the exceptions handler and peripherals interrupt service routine, and calls HAL_IncTick() at regular time intervals to increment a local variable (declared in <i>stm32f3xx_hal.c</i>) used as HAL timebase. By default, this function is called each 1ms in SysTick ISR.. The PPP_IRQHandler() routine must call HAL_PPP_IRQHandler() if an interrupt based process is used within the application.
<i>main.c/h</i>	This file contains the main program routine, mainly: <ul style="list-style-type: none"> • the call to HAL_Init() • assert_failed() implementation • system clock configuration • peripheral HAL initialization and user application code.

The STM32Cube package comes with ready-to-use project templates, one for each supported board. Each project contains the files listed above and a preconfigured project for the supported toolchains.

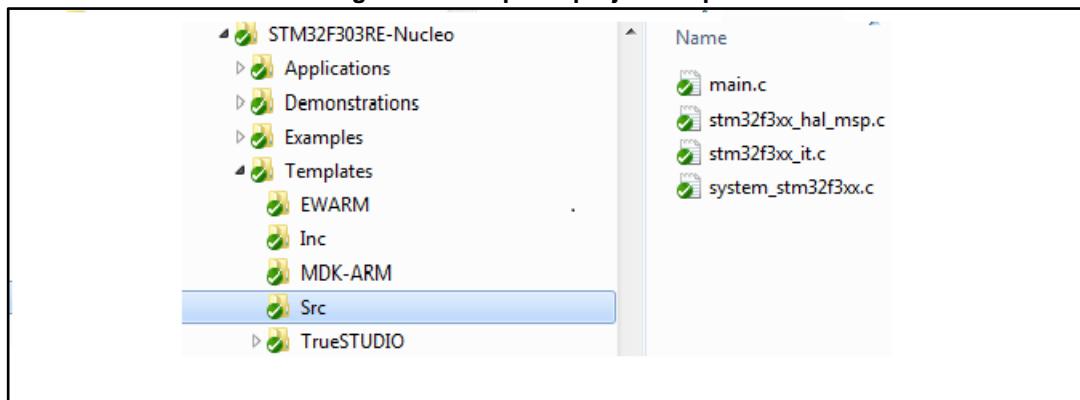

Each project template provides empty main loop function and can be used as a starting point to get familiar with project settings for STM32Cube. Its features are the following:

- It contains the sources of HAL, CMSIS and BSP drivers which are the minimal components to develop a code on a given board.
- It contains the include paths for all the firmware components.
- It defines the STM32 device supported, and allows configuring the CMSIS and HAL drivers accordingly.
- It provides ready-to-use user files preconfigured as defined below:
 - HAL is initialized
 - SysTick ISR implemented for HAL_Delay()
 - System clock configured with the maximum frequency of the device

If an existing project is copied to another location, then include paths must be updated.

Figure 1: Example of project template

2.2 HAL data structures

Each HAL driver can contain the following data structures:

- Peripheral handle structures
- Initialization and configuration structures
- Specific process structures.

2.2.1 Peripheral handle structures

The APIs have a modular generic multi-instance architecture that allows working with several IP instances simultaneously.

PPP_HandleTypeDef *handle is the main structure that is implemented in the HAL drivers. It handles the peripheral/module configuration and registers and embeds all the structures and variables needed to follow the peripheral device flow.

The peripheral handle is used for the following purposes:

- Multi instance support: each peripheral/module instance has its own handle. As a result instance resources are independent.
- Peripheral process intercommunication: the handle is used to manage shared data resources between the process routines.
Example: global pointers, DMA handles, state machine.
- Storage : this handle is used also to manage global variables within a given HAL driver.

An example of peripheral structure is shown below:

```
typedef struct
{
    USART_TypeDef *Instance; /* USART registers base address */
    USART_InitTypeDef Init; /* Usart communication parameters */
    uint8_t *pTxBuffPtr; /* Pointer to Usart Tx transfer Buffer */
    uint16_t TxXferSize; /* Usart Tx Transfer size */
    __IO uint16_t TxXferCount; /* Usart Tx Transfer Counter */
    uint8_t *pRxBuffPtr; /* Pointer to Usart Rx transfer Buffer */
    uint16_t RxXferSize; /* Usart Rx Transfer size */
    __IO uint16_t RxXferCount; /* Usart Rx Transfer Counter */
    DMA_HandleTypeDef *hdmatx; /* Usart Tx DMA Handle parameters */
    DMA_HandleTypeDef *hdmarx; /* Usart Rx DMA Handle parameters */
    HAL_LockTypeDef Lock; /* Locking object */
    __IO HAL_USART_StateTypeDef State; /* Usart communication state */
    __IO HAL_USART_ErrorTypeDef ErrorCode; /* USART Error code */
}USART_HandleTypeDef;
```

1) The multi-instance feature implies that all the APIs used in the application are re-entrant and avoid using global variables because subroutines can fail to be re-entrant if they rely on a global variable to remain unchanged but that variable is modified when the subroutine is recursively invoked. For this reason, the following rules are respected:

- Re-entrant code does not hold any static (or global) non-constant data: re-entrant functions can work with global data. For example, a re-entrant interrupt service routine can grab a piece of hardware status to work with (e.g. serial port read buffer) which is not only global, but volatile. Still, typical use of static variables and global data is not advised, in the sense that only atomic read-modify-write instructions should be used in these variables. It should not be possible for an interrupt or signal to occur during the execution of such an instruction.
- Reentrant code does not modify its own code.

2) When a peripheral can manage several processes simultaneously using the DMA (full duplex case), the DMA interface handle for each process is added in the PPP_HandleTypeDef.

3) For the shared and system peripherals, no handle or instance object is used. The peripherals concerned by this exception are the following:

- GPIO
- SYSTICK
- NVIC
- PWR
- RCC
- FLASH.

2.2.2 Initialization and configuration structure

These structures are defined in the generic driver header file when it is common to all part numbers. When they can change from one part number to another, the structures are defined in the extension header file for each part number.

```
typedef struct
{
    uint32_t BaudRate; /*!< This member configures the UART communication baudrate.*/
    uint32_t WordLength; /*!< Specifies the number of data bits transmitted or received
    in a frame.*/
    uint32_t StopBits; /*!< Specifies the number of stop bits transmitted.*/
    uint32_t Parity; /*!< Specifies the parity mode. */
    uint32_t Mode; /*!< Specifies whether the Receive or Transmit mode is enabled or
    disabled.*/
    uint32_t HwFlowCtl; /*!< Specifies whether the hardware flow control mode is enabled
    or disabled.*/
    uint32_t OverSampling; /*!< Specifies whether the Over sampling 8 is enabled or
    disabled,
    to achieve higher speed (up to fPCLK/8).*/
}UART_HandleTypeDef;
```

The config structure is used to initialize the sub-modules or sub-instances. See below example:

```
HAL_ADC_ConfigChannel (ADC_HandleTypeDef* hadc, ADC_ChannelConfTypeDef* sConfig)
```

2.2.3 Specific process structures

The specific process structures are used for specific process (common APIs). They are defined in the generic driver header file.

Example:

```
HAL_PPP_Process (PPP_HandleTypeDef* hadc, PPP_ProcessConfig* sConfig)
```

2.3 API classification

The HAL APIs are classified into three categories:

- **Generic APIs:** common generic APIs applying to all STM32 devices. These APIs are consequently present in the generic HAL driver files of all STM32 microcontrollers.

```

HAL_StatusTypeDef HAL_ADC_Init(ADC_HandleTypeDef* hadc); HAL_StatusTypeDef
HAL_ADC_DeInit(ADC_HandleTypeDef *hadc); HAL_StatusTypeDef
HAL_ADC_Start(ADC_HandleTypeDef* hadc); HAL_StatusTypeDef
HAL_ADC_Stop(ADC_HandleTypeDef* hadc); HAL_StatusTypeDef
HAL_ADC_Start_IT(ADC_HandleTypeDef* hadc); HAL_StatusTypeDef
HAL_ADC_Stop_IT(ADC_HandleTypeDef* hadc); void HAL_ADC_IRQHandler(ADC_HandleTypeDef* hadc);

```

- **Extension APIs:** This set of API is divided into two sub-categories :
 - **Family specific APIs:** APIs applying to a given family. They are located in the extension HAL driver file (see example below related to the ADC).

```

HAL_StatusTypeDef HAL_ADCEx_Calibration_Start(ADC_HandleTypeDef* hadc, uint32_t
SingleDiff); uint32_t HAL_ADCEx_Calibration_GetValue(ADC_HandleTypeDef* hadc,
uint32_t SingleDiff);

```

- **Device part number specific APIs:** These APIs are implemented in the extension file and delimited by specific define statements relative to a given part number.

```

#if defined(STM32F302xC) || defined(STM32F303xC) || defined(STM32F358xx) || \
defined(STM32F303x8) || defined(STM32F334x8) || defined(STM32F328xx) || \
defined(STM32F301x8) || defined(STM32F302x8) || defined(STM32F318xx) || \
defined(STM32F373xC) || defined(STM32F378xx) #endif /* STM32F302xC || STM32F303xC || \
STM32F358xx || */ /* STM32F303x8 || STM32F334x8 || STM32F328xx || */ /* STM32F301x8 \
|| STM32F302x8 || STM32F318xx */ /* STM32F373xC || STM32F378xx */

```

The data structure related to the specific APIs is delimited by the device part number define statement. It is located in the corresponding extension header C file.

The following table summarizes the location of the different categories of HAL APIs in the driver files.

Table 4: API classification

	Generic file	Extension file
Common APIs	X	X ⁽¹⁾
Family specific APIs		X
Device specific APIs		X

Notes:

⁽¹⁾In some cases, the implementation for a specific device part number may change . In this case the generic API is declared as weak function in the extension file. The API is implemented again to overwrite the default function

Family specific APIs are only related to a given family. This means that if a specific API is implemented in another family, and the arguments of this latter family are different, additional structures and arguments might need to be added.

The IRQ handlers are used for common and family specific processes.

2.4 Devices supported by HAL drivers

2.5 HAL driver rules

2.5.1 HAL API naming rules

The following naming rules are used in HAL drivers:

Table 6: HAL API naming rules

	Generic	Family specific	Device specific
File names	<i>stm32f3xx_hal_ppp (c/h)</i>	<i>stm32f3xx_hal_ppp_ex (c/h)</i>	<i>stm32f3xx_hal_ppp_ex (c/h)</i>
Module name	<i>HAL_PPP_MODULE</i>		
Function name	<i>HAL_PPP_Function</i> <i>HAL_PPP_FeatureFunction_MODE</i>	<i>HAL_PPPEx_Function</i> <i>HAL_PPPEx_FeatureFunction_MODE</i>	<i>HAL_PPPEx_Function</i> <i>HAL_PPPEx_FeatureFunction_MODE</i>
Handle name	<i>PPP_HandleTypeDef</i>	NA	NA
Init structure name	<i>PPP_InitTypeDef</i>	NA	<i>PPP_InitTypeDef</i>
Enum name	<i>HAL_PPP_StructnameTypeDef</i>	NA	NA

- The **PPP** prefix refers to the peripheral functional mode and not to the peripheral itself. For example, if the USART, PPP can be USART, IRDA, UART or SMARTCARD depending on the peripheral mode.
- The constants used in one file are defined within this file. A constant used in several files is defined in a header file. All constants are written in uppercase, except for peripheral driver function parameters.
- typedef variable names should be suffixed with _TypeDef.
- Registers are considered as constants. In most cases, their name is in uppercase and uses the same acronyms as in the STM32F3xx reference manuals.
- Peripheral registers are declared in the PPP_TypeDef structure (e.g. ADC_TypeDef) in the CMSIS header file corresponding to the selected platform: stm32f301x8.h, stm32f302x8.h, stm32f302xc.h, stm32f302xe.h, stm32f303x8.h, stm32f303xc.h, stm32f303xe.h, stm32f318xx.h, stm32f328xx.h, stm32f334x8.h, stm32f358xx.h, stm32f373xc.h, stm32f378xx.h and stm32f398xx.h . The platform is selected by enabling the compilation switch in the compilation toolchain directive or in the stm32f3xx.h file.
- Peripheral function names are prefixed by HAL_, then the corresponding peripheral acronym in uppercase followed by an underscore. The first letter of each word is in uppercase (e.g. HAL_UART_Transmit()). Only one underscore is allowed in a function name to separate the peripheral acronym from the rest of the function name.
- The structure containing the PPP peripheral initialization parameters are named PPP_InitTypeDef (e.g. ADC_InitTypeDef).
- The structure containing the Specific configuration parameters for the PPP peripheral are named PPP_xxxxConfTypeDef (e.g. ADC_ChannelConfTypeDef).
- Peripheral handle structures are named PPP_HandleTypeDef (e.g DMA_HandleTypeDef)
- The functions used to initialize the PPP peripheral according to parameters specified in PPP_InitTypeDef are named HAL_PPP_Init (e.g. HAL_TIM_Init()).

- The functions used to reset the PPP peripheral registers to their default values are named PPP_Delnit, e.g. TIM_Delnit.
- The **MODE** suffix refers to the process mode, which can be polling, interrupt or DMA. As an example, when the DMA is used in addition to the native resources, the function should be called: *HAL_PPP_Function_DMA ()*.
- The **Feature** prefix should refer to the new feature. Example: *HAL_ADC_Start()* refers to the injection mode

2.5.2 HAL general naming rules

- For the shared and system peripherals, no handle or instance object is used. This rule applies to the following peripherals:
 - GPIO
 - SYSTICK
 - NVIC
 - RCC
 - FLASH.

Example: The *HAL_GPIO_Init()* requires only the GPIO address and its configuration parameters.

```
HAL_StatusTypeDef HAL_GPIO_Init (GPIO_TypeDef* GPIOx, GPIO_InitTypeDef *Init)
{
/*GPIO Initialization body */
}
```

- The macros that handle interrupts and specific clock configurations are defined in each peripheral/module driver. These macros are exported in the peripheral driver header files so that they can be used by the extension file. The list of these macros is defined below: This list is not exhaustive and other macros related to peripheral features can be added, so that they can be used in the user application.

Table 7: Macros handling interrupts and specific clock configurations

Macros	Description
<code>_HAL_PPP_ENABLE_IT(_HANDLE_, _INTERRUPT_)</code>	Enables a specific peripheral interrupt
<code>_HAL_PPP_DISABLE_IT(_HANDLE_, _INTERRUPT_)</code>	Disables a specific peripheral interrupt
<code>_HAL_PPP_GET_IT (_HANDLE_, _INTERRUPT_)</code>	Gets a specific peripheral interrupt status
<code>_HAL_PPP_CLEAR_IT (_HANDLE_, _INTERRUPT_)</code>	Clears a specific peripheral interrupt status
<code>_HAL_PPP_GET_FLAG (_HANDLE_, _FLAG_)</code>	Gets a specific peripheral flag status
<code>_HAL_PPP_CLEAR_FLAG (_HANDLE_, _FLAG_)</code>	Clears a specific peripheral flag status
<code>_HAL_PPP_ENABLE(_HANDLE_)</code>	Enables a peripheral
<code>_HAL_PPP_DISABLE(_HANDLE_)</code>	Disables a peripheral
<code>_HAL_PPP_XXXX (_HANDLE_, _PARAM_)</code>	Specific PPP HAL driver macro
<code>_HAL_PPP_GET_IT_SOURCE (_HANDLE_, _INTERRUPT_)</code>	Checks the source of specified interrupt

- NVIC and SYSTICK are two ARM Cortex core features. The APIs related to these features are located in the `stm32f3xx_hal_cortex.c` file.
- When a status bit or a flag is read from registers, it is composed of shifted values depending on the number of read values and of their size. In this case, the returned status width is 32 bits. Example : `STATUS = XX | (YY << 16) or STATUS = XX | (YY << 8) | (YY << 16) | (YY << 24)`".
- The PPP handles are valid before using the `HAL_PPP_Init()` API. The init function performs a check before modifying the handle fields.

```
HAL_PPP_Init(PPP_HandleTypeDef)
{
    if(hppp == NULL)
    {
        return HAL_ERROR;
    }
}
```

- The macros defined below are used:
 - Conditional macro:

```
#define ABS(x) ((x) > 0) ? (x) : -(x)
```

- Pseudo-code macro (multiple instructions macro):

```
#define HAL_LINKDMA( HANDLE , PPP_DMA_FIELD , DMA_HANDLE ) \
do{ \
    ( __HANDLE__ )-> __PPP_DMA_FIELD__ = &( __DMA_HANDLE__ ); \
    ( __DMA_HANDLE__ ).Parent = ( __HANDLE__ ); \
} while(0)
```

2.5.3 HAL interrupt handler and callback functions

Besides the APIs, HAL peripheral drivers include:

- `HAL_PPP_IRQHandler()` peripheral interrupt handler that should be called from `stm32f3xx_it.c`
- User callback functions.

The user callback functions are defined as empty functions with “weak” attribute. They have to be defined in the user code.

There are three types of user callbacks functions:

- Peripheral system level initialization/ de-Initialization callbacks: `HAL_PPP_MspInit()` and `HAL_PPP_MspDeInit()`
- Process complete callbacks : `HAL_PPP_ProcessCpltCallback`
- Error callback: `HAL_PPP_ErrorCallback`.

Table 8: Callback functions

Callback functions	Example
<code>HAL_PPP_MspInit() / _DeInit()</code>	Ex: <code>HAL_USART_MspInit()</code> Called from <code>HAL_PPP_Init()</code> API function to perform peripheral system level initialization (GPIOs, clock, DMA, interrupt)
<code>HAL_PPP_ProcessCpltCallback</code>	Ex: <code>HAL_USART_TxCpltCallback</code> Called by peripheral or DMA interrupt handler when the process completes
<code>HAL_PPP_ErrorCallback</code>	Ex: <code>HAL_USART_ErrorCallback</code> Called by peripheral or DMA interrupt handler when an error occurs

2.6 HAL generic APIs

The generic APIs provide common generic functions applying to all STM32 devices. They are composed of four APIs groups:

- **Initialization and de-initialization functions:** HAL_PPP_Init(), HAL_PPP_DeInit()
- **IO operation functions:** HAL_PPP_Read(), HAL_PPP_Write(), HAL_PPP_Transmit(), HAL_PPP_Receive()
- **Control functions:** HAL_PPP_Set(), HAL_PPP_Get().
- **State and Errors functions:** HAL_PPP_GetState(), HAL_PPP_GetError().

For some peripheral/module drivers, these groups are modified depending on the peripheral/module implementation.

Example: in the timer driver, the API grouping is based on timer features (PWM, OC, IC...).

The initialization and de-initialization functions allow initializing a peripheral and configuring the low-level resources, mainly clocks, GPIO, alternate functions (AF) and possibly DMA and interrupts. The *HAL_DeInit()* function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.

The IO operation functions perform a row access to the peripheral payload data in write and read modes.

The control functions are used to change dynamically the peripheral configuration and set another operating mode.

The peripheral state and errors functions allow retrieving in runtime the peripheral and data flow states, and identifying the type of errors that occurred. The example below is based on the ADC peripheral. The list of generic APIs is not exhaustive. It is only given as an example.

Table 9: HAL generic APIs

Function group	Common API name	Description
<i>Initialization group</i>	<i>HAL_ADC_Init()</i>	This function initializes the peripheral and configures the low -level resources (clocks, GPIO, AF..)
	<i>HAL_ADC_DeInit()</i>	This function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.
<i>IO operation group</i>	<i>HAL_ADC_Start()</i>	This function starts ADC conversions when the polling method is used
	<i>HAL_ADC_Stop()</i>	This function stops ADC conversions when the polling method is used
	<i>HAL_ADC_PollForConversion()</i>	This function allows waiting for the end of conversions when the polling method is used. In this case, a timeout value is specified by the user according to the application.
	<i>HAL_ADC_Start_IT()</i>	This function starts ADC conversions when the interrupt method is used
	<i>HAL_ADC_Stop_IT()</i>	This function stops ADC conversions when the interrupt method is used
	<i>HAL_ADC_IRQHandler()</i>	This function handles ADC interrupt requests

Function group	Common API name	Description
<i>Control group</i>	<i>HAL_ADC_ConvCpltCallback()</i>	Callback function called in the IT subroutine to indicate the end of the current process or when a DMA transfer has completed
	<i>HAL_ADC_ErrorCallback()</i>	Callback function called in the IT subroutine if a peripheral error or a DMA transfer error occurred
<i>Control group</i>	<i>HAL_ADC_ConfigChannel()</i>	This function configures the selected ADC regular channel, the corresponding rank in the sequencer and the sample time
	<i>HAL_ADC_AnalogWDGConfig</i>	This function configures the analog watchdog for the selected ADC
<i>State and Errors group</i>	<i>HAL_ADC_GetState()</i>	This function allows getting in runtime the peripheral and the data flow states.
	<i>HAL_ADC_GetError()</i>	This function allows getting in runtime the error that occurred during IT routine

2.7 HAL extension APIs

2.7.1 HAL extension model overview

The extension APIs provide specific functions or overwrite modified APIs for a specific family (series) or specific part number within the same family.

The extension model consists of an additional file, `stm32f3xx_hal_ppp_ex.c`, that includes all the specific functions and define statements (`stm32f3xx_hal_ppp_ex.h`) for a given part number.

Below an example based on the ADC peripheral:

Table 10: HAL extension APIs

Function Group	Common API Name
<i>HAL_ADCEx_Calibration_Start()</i>	This function is used to start the automatic ADC calibration
<i>HAL_ADCEx_Calibration_GetValue()</i>	This function is used to get the ADC calibration factor
<i>HAL_ADCEx_Calibration_SetValue()</i>	This function is used to set the calibration factor to overwrite automatic conversion result

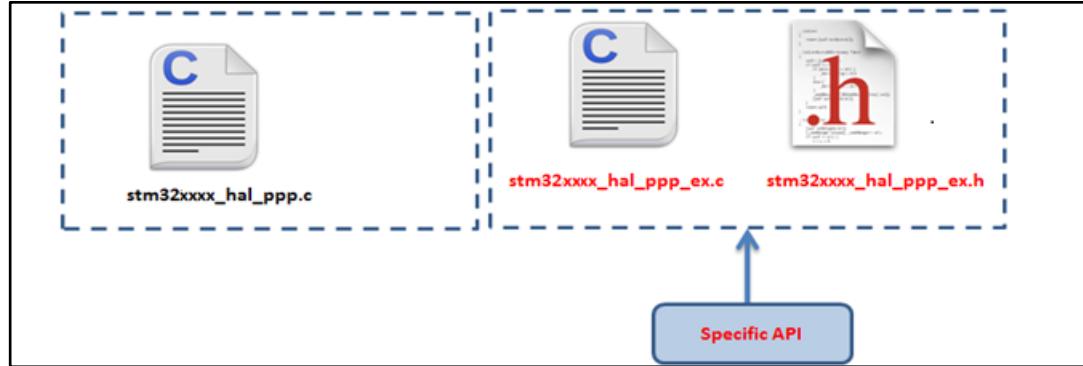

2.7.2 HAL extension model cases

The specific IP features can be handled by the HAL drivers in five different ways. They are described below.

Case 1: Adding a part number-specific function

When a new feature specific to a given device is required, the new APIs are added in the `stm32f3xx_hal_adc_ex.c` extension file. They are named `HAL_PPPEx_Function()`.

Figure 2: Adding device-specific functions

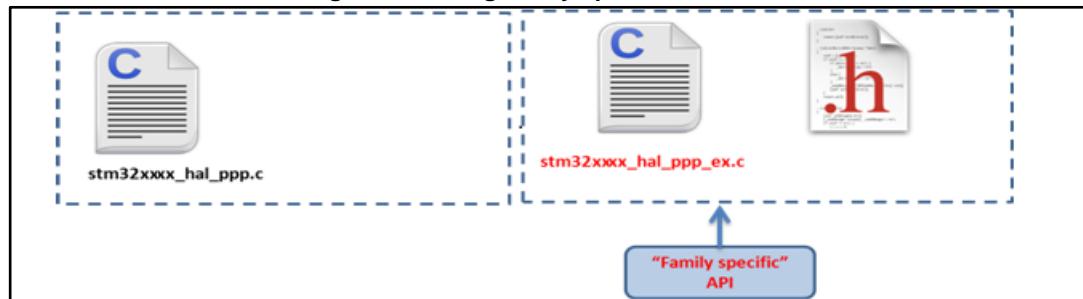

Example: `stm32f3xx_hal_adc_ex.c/h`

```
#if defined(STM32F302xE) || defined(STM32F303xE) || defined(STM32F398xx) || \
defined(STM32F302xC) || defined(STM32F303xC) || defined(STM32F358xx) || \
defined(STM32F303x8) || defined(STM32F334x8) || defined(STM32F328xx) || \
defined(STM32F301x8) || defined(STM32F302x8) || defined(STM32F318xx)
HAL_StatusTypeDef HAL_ADCEx_Calibration_Start(struct ADC_HandleTypeDef* hadc,
uint32_t SingleDiff);
uint32_t HAL_ADCEx_Calibration_GetValue(struct ADC_HandleTypeDef *hadc, uint32_t
SingleDiff);
HAL_StatusTypeDef HAL_ADCEx_Calibration_SetValue(struct ADC_HandleTypeDef *hadc,
uint32_t SingleDiff, uint32_t CalibrationFactor);
#endif /* STM32F302xE || STM32F303xE || STM32F398xx || */
/* STM32F302xC || STM32F303xC || STM32F358xx || */
/* STM32F303x8 || STM32F334x8 || STM32F328xx || */
/* STM32F301x8 || STM32F302x8 || STM32F318xx */
```

Case 2: Adding a family-specific function

In this case, the API is added in the extension driver C file and named `HAL_PPPEx_Function()`.

Figure 3: Adding family-specific functions

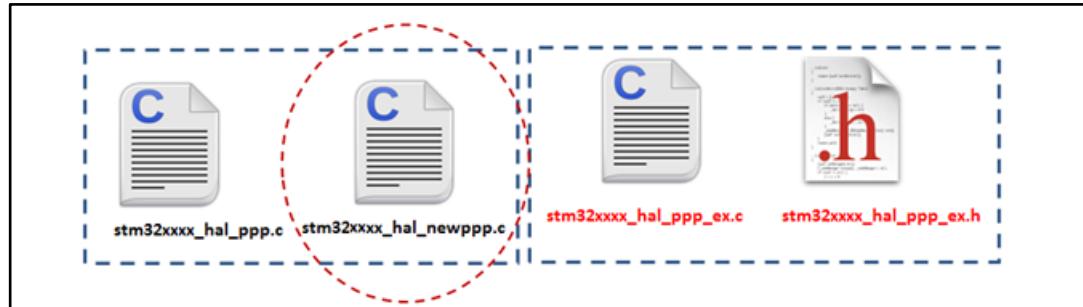

Case 3: Adding a new peripheral (specific to a device belonging to a given family)

When a peripheral which is available only in a specific device is required, the APIs corresponding to this new peripheral/module are added in `stm32f3xx_hal_newppp.c`. However the inclusion of this file is selected in the `stm32f3xx_hal_conf.h` using the macro:

```
#define HAL_NEWPPP_MODULE_ENABLED
```

Figure 4: Adding new peripherals

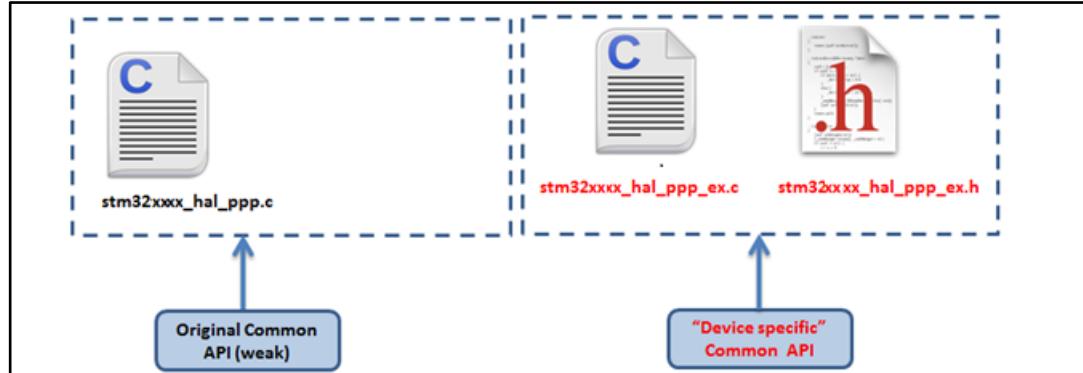

Example: xx_hal_sdadc.c/h

Case 4: Updating existing common APIs

In this case, the routines are defined with the same names in the `xx_hal_ppp_ex.c` extension file, while the generic API is defined as *weak*, so that the compiler will overwrite the original routine by the new defined function.

Figure 5: Updating existing APIs

Case 5: Updating existing data structures

The data structure for a specific device part number (e.g. `PPP_InitTypeDef`) can be composed of different fields. In this case, the data structure is defined in the extension header file and delimited by the specific part number define statement.

Example:

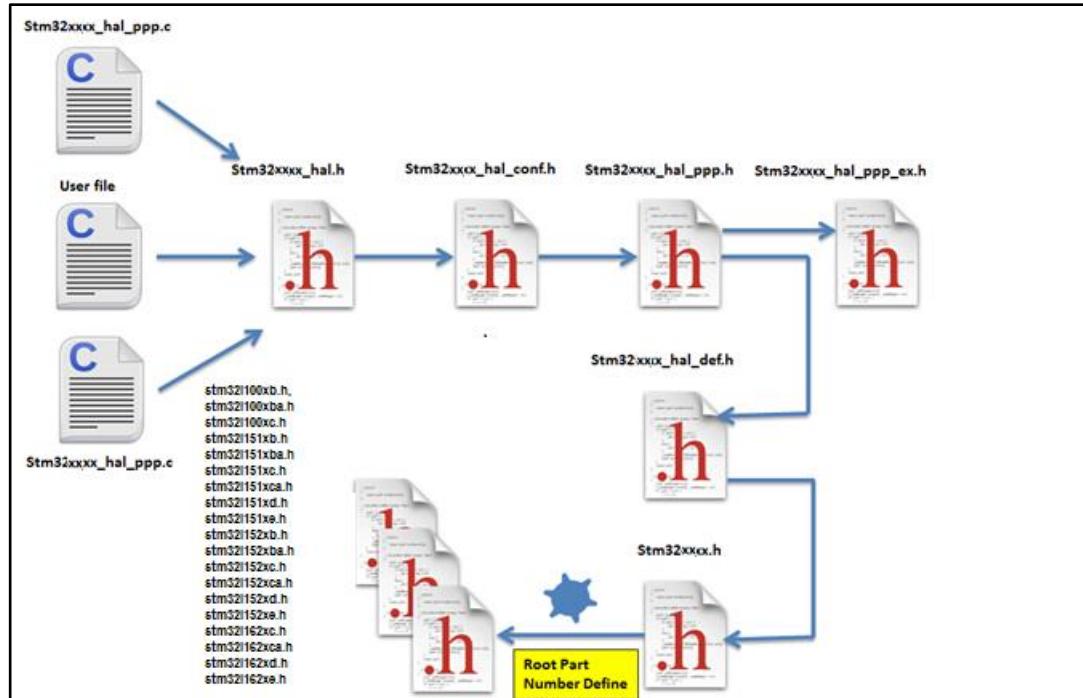

```
#if defined(STM32F373xC) || defined(STM32F378xx)
typedef struct
{
(...)

}PPP_InitTypeDef;
#endif /* STM32F373xC || STM32F378xx */
```

2.8 File inclusion model

The header of the common HAL driver file (stm32f3xx_hal.h) includes the common configurations for the whole HAL library. It is the only header file that is included in the user sources and the HAL C sources files to be able to use the HAL resources.

Figure 6: File inclusion model

A PPP driver is a standalone module which is used in a project. The user must enable the corresponding USE_HAL_PPP_MODULE define statement in the configuration file.

```
/*
 * @file stm32f3xx_hal_conf.h
 * @author MCD Application Team
 * @version VX.Y.Z * @date dd-mm-yyyy
 * @brief This file contains the modules to be used
 */
(...)

#define USE_HAL_USART_MODULE
#define USE_HAL_IRDA_MODULE
#define USE_HAL_DMA_MODULE
#define USE_HAL_RCC_MODULE
(...)
```

2.9 HAL common resources

The common HAL resources, such as common define enumerations, structures and macros, are defined in *stm32f3xx_hal_def.h*. The main common define enumeration is *HAL_StatusTypeDef*.

- **HAL Status** The HAL status is used by almost all HAL APIs, except for boolean functions and IRQ handler. It returns the status of the current API operations. It has four possible values as described below: **Service statut**

```
Typedef enum
{
    HAL_OK = 0x00, HAL_ERROR = 0x01, HAL_BUSY = 0x02, HAL_TIMEOUT = 0x03
} HAL_StatusTypeDef;
```

- **HAL Locked**

The HAL lock is used by all HAL APIs to prevent accessing by accident shared resources.

```
typedef enum
{
    HAL_UNLOCKED = 0x00, /*!<Resources unlocked */
    HAL_LOCKED = 0x01 /*!< Resources locked */
} HAL_LockTypeDef;
```

In addition to common resources, the `stm32f3xx_hal_def.h` file calls the `stm32f3xx.h` file in CMSIS library to get the data structures and the address mapping for all peripherals:

- Declarations of peripheral registers and bits definition.
- Macros to access peripheral registers hardware (Write register, Read register...etc.).

- **Common macros**

- Macro defining `HAL_MAX_DELAY`

```
#define HAL_MAX_DELAY 0xFFFFFFFF
– Macro linking a PPP peripheral to a DMA structure pointer: __HAL_LINKDMA();
```

```
#define HAL_LINKDMA( HANDLE , PPP_DMA_FIELD , DMA_HANDLE ) \
do{ \
    ( __HANDLE__ )->__PPP_DMA_FIELD__ = &( __DMA_HANDLE__ ); \
    ( __DMA_HANDLE__ ).Parent = ( __HANDLE__ ); \
} while(0)
```

2.10 HAL configuration

The configuration file, `stm32f3xx_hal_conf.h`, allows customizing the drivers for the user application. Modifying this configuration is not mandatory: the application can use the default configuration without any modification.

To configure these parameters, the user should enable, disable or modify some options by uncommenting, commenting or modifying the values of the related define statements as described in the table below:

Table 11: Define statements used for HAL configuration

Configuration item	Description	Default Value
<code>HSE_VALUE</code>	Defines the value of the external oscillator (HSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	8 000 000 (Hz)
<code>HSE_STARTUP_TIMEOUT</code>	Timeout for HSE start-up, expressed in ms	5000
<code>HSI_VALUE</code>	Defines the value of the internal oscillator (HSI) expressed in Hz.	16 000 000 (Hz)
<code>HSI_STARTUP_TIMEOUT</code>	Timeout for HSI start-up, expressed in ms	5000
<code>LSE_VALUE</code>	Defines the value of the external oscillator (HSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	32768 (Hz)
<code>LSE_STARTUP_TIMEOUT</code>	Timeout for LSE start-up, expressed in ms	5000
<code>LSI_VALUE</code>	Defines the value of the Internal Low Speed oscillator expressed in Hz. The real value may vary depending on the variations in voltage and temperature.	40 000 (Hz)
<code>VDD_VALUE</code>	VDD value	3300 (mV)

Configuration item	Description	Default Value
USERTOS	Enables the use of RTOS	FALSE (for future use)
PREFETCH_ENABLE	Enables prefetch feature	TRUE

The `stm32f3xx_hal_conf_template.h` file is located in the HAL drivers `/Inc` folder. It should be copied to the user folder, renamed and modified as described above.

By default, the values defined in the `stm32f3xx_hal_conf_template.h` file are the same as the ones used for the examples and demonstrations. All HAL include files are enabled so that they can be used in the user code without modifications.

2.11 HAL system peripheral handling

This chapter gives an overview of how the system peripherals are handled by the HAL drivers. The full API list is provided within each peripheral driver description section.

2.11.1 Clock

Two main functions can be used to configure the system clock:

- `HAL_RCC_OscConfig (RCC_OscInitTypeDef *RCC_OscInitStruct)`. This function configures/enables multiple clock sources (HSE, HSI, LSE, LSI, PLL).
- `HAL_RCC_ClockConfig (RCC_ClkInitTypeDef *RCC_ClkInitStruct, uint32_t FLatency)`. This function
 - selects the system clock source
 - configures AHB and APB clock dividers
 - configures the number of Flash memory wait states
 - updates the SysTick configuration when HCLK clock changes.

Some peripheral clocks are not derived from the system clock (RTC, USB...). In this case, the clock configuration is performed by an extended API defined in `stm32f3xx_hal_rcc_ex.c`: `HAL_RCCE_PeriphCLKConfig(RCC_PeriphCLKInitTypeDef *PeriphClkInit)`.

Additional RCC HAL driver functions are available:

- `HAL_RCC_DeInit()` Clock de-init function that return clock configuration to reset state
- Get clock functions that allow retrieving various clock configurations (system clock, HCLK, PCLK1, ...)
- MCO and CSS configuration functions

A set of macros are defined in `stm32f3xx_hal_rcc.h` and `stm32f3xx_hal_rcc_ex.h`. They allow executing elementary operations on RCC block registers, such as peripherals clock gating/reset control:

- `__PPP_CLK_ENABLE/__PPP_CLK_DISABLE` to enable/disable the peripheral clock
- `__PPP_FORCE_RESET/__PPP_RELEASE_RESET` to force/release peripheral reset
- `__PPP_CLK_SLEEP_ENABLE/__PPP_CLK_SLEEP_DISABLE` to enable/disable the peripheral clock during low power (Sleep) mode.

2.11.2 GPIOs

GPIO HAL APIs are the following:

- HAL_GPIO_Init() / HAL_GPIO_DeInit()
- HAL_GPIO_ReadPin() / HAL_GPIO_WritePin()
- HAL_GPIO_TogglePin () .

In addition to standard GPIO modes (input, output, analog), the pin mode can be configured as EXTI with interrupt or event generation.

When selecting EXTI mode with interrupt generation, the user must call HAL_GPIO_EXTI_IRQHandler() from stm32f3xx_it.c and implement HAL_GPIO_EXTI_Callback()

The table below describes the GPIO_InitTypeDef structure field.

Table 12: Description of GPIO_InitTypeDef structure

Structure field	Description
Pin	Specifies the GPIO pins to be configured. Possible values: GPIO_PIN_x or GPIO_PIN_All, where x[0..15]
Mode	Specifies the operating mode for the selected pins: GPIO mode or EXTI mode. Possible values are: <ul style="list-style-type: none"> • <u>GPIO mode</u> <ul style="list-style-type: none"> – GPIO_MODE_INPUT : Input floating – GPIO_MODE_OUTPUT_PP : Output push-pull – GPIO_MODE_OUTPUT_OD : Output open drain – GPIO_MODE_AF_PP : Alternate function push-pull – GPIO_MODE_AF_OD : Alternate function open drain – GPIO_MODE_ANALOG : Analog mode • <u>External Interrupt mode</u> <ul style="list-style-type: none"> – GPIO_MODE_IT_RISING : Rising edge trigger detection – GPIO_MODE_IT_FALLING : Falling edge trigger detection – GPIO_MODE_IT_RISING_FALLING : Rising/Falling edge trigger detection • <u>External Event mode</u> <ul style="list-style-type: none"> – GPIO_MODE_EVT_RISING : Rising edge trigger detection – GPIO_MODE_EVT_FALLING : Falling edge trigger detection – GPIO_MODE_EVT_RISING_FALLING: Rising/Falling edge trigger detection
Pull	Specifies the Pull-up or Pull-down activation for the selected pins. Possible values are: GPIO_NOPULL GPIO_PULLUP GPIO_PULLDOWN
Speed	Specifies the speed for the selected pins Possible values are: GPIO_SPEED_FREQ_LOW GPIO_SPEED_FREQ_MEDIUM GPIO_SPEED_FREQ_HIGH

Structure field	Description
Alternate	<p>Peripheral to be connected to the selected pins. Possible values: GPIO_AFx_PP, where AFx: is the alternate function index PP: is the peripheral instance Example: use GPIO_AF1_TIM2 to connect TIM2 IOs on AF1. These values are defined in the GPIO extended driver, since the AF mapping may change between product lines.</p>  <p>Refer to the "Alternate function mapping" table in the datasheets for the detailed description of the system and peripheral I/O alternate functions.</p>

Please find below typical GPIO configuration examples:

- Configuring GPIOs as output push-pull to drive external LEDs

```
GPIO_InitStruct.Pin = GPIO_PIN_12 | GPIO_PIN_13 | GPIO_PIN_14 | GPIO_PIN_15;
GPIO_InitStruct.Mode = GPIO_MODE_OUTPUT_PP;
GPIO_InitStruct.Pull = GPIO_PULLUP;
GPIO_InitStruct.Speed = GPIO_SPEED_FREQ_MEDIUM;
HAL_GPIO_Init(GPIOD, &GPIO_InitStruct);
```

- Configuring PA0 as external interrupt with falling edge sensitivity:

```
GPIO_InitStructure.Mode = GPIO_MODE_IT_FALLING;
GPIO_InitStructure.Pull = GPIO_NOPULL;
GPIO_InitStructure.Pin = GPIO_PIN_0;
HAL_GPIO_Init(GPIOA, &GPIO_InitStructure);
```

- Configuring USART1 Tx (PA9, mapped on AF4) as alternate function:

```
GPIO_InitStruct.Pin = GPIO_PIN_9;
GPIO_InitStruct.Mode = GPIO_MODE_AF_PP;
GPIO_InitStruct.Pull = GPIO_PULLUP;
GPIO_InitStruct.Speed = GPIO_SPEED_FREQ_HIGH;
GPIO_InitStruct.Alternate = GPIO_AF4_USART1;
HAL_GPIO_Init(GPIOA, &GPIO_InitStruct);
```

2.11.3 Cortex NVIC and SysTick timer

The Cortex HAL driver, `stm32f3xx_hal_cortex.c`, provides APIs to handle NVIC and Systick. The supported APIs include:

- HAL_NVIC_SetPriority()
- HAL_NVIC_EnableIRQ() / HAL_NVIC_DisableIRQ()
- HAL_NVIC_SystemReset()
- HAL_SYSTICK_IRQHandler()
- HAL_NVIC_GetPendingIRQ() / HAL_NVIC_SetPendingIRQ() / HAL_NVIC_ClearPendingIRQ()
- HAL_SYSTICK_Config()
- HAL_SYSTICK_CLKSourceConfig()
- HAL_SYSTICK_Callback()

2.11.4 PWR

The PWR HAL driver handles power management. The features shared between all STM32 Series are listed below:

- PVD configuration, enabling/disabling and interrupt handling
 - HAL_PWR_PVDCConfig()
 - HAL_PWR_EnablePVD() / HAL_PWR_DisablePVD()
 - HAL_PWR_PVD_IRQHandler()
 - HAL_PWR_PVDCallback()
- Wakeup pin configuration
 - HAL_PWR_EnableWakeUpPin() / HAL_PWR_DisableWakeUpPin()
- Low-power mode entry
 - HAL_PWR_EnterSLEEPMode()
 - HAL_PWR_EnterSTOPMode()
 - HAL_PWR_EnterSTANDBYMode()
- Backup domain configuration
 - HAL_PWR_EnableBkUpAccess() / HAL_PWR_DisableBkUpAccess()

2.11.5 EXTI

The EXTI is not considered as a standalone peripheral but rather as a service used by other peripheral. As a result there are no EXTI APIs but each peripheral HAL driver implements the associated EXTI configuration and EXTI function are implemented as macros in its header file.

The first 16 EXTI lines connected to the GPIOs are managed within the GPIO driver. The GPIO_InitTypeDef structure allows configuring an I/O as external interrupt or external event.

The EXTI lines connected internally to the PVD, RTC, USB, and COMP are configured within the HAL drivers of these peripheral through the macros given in the table below. The EXTI internal connections depend on the targeted STM32 microcontroller (refer to the product datasheet for more details):

Table 13: Description of EXTI configuration macros

Macros	Description
PPP_EXTI_LINE_FUNCTION	Defines the EXTI line connected to the internal peripheral. Example: <code>#define PWR_EXTI_LINE_PVD ((uint32_t)0x00010000) /*!<External interrupt line 16 Connected to the PVD EXTI Line */</code>
_HAL_PPP_EXTI_ENABLE_IT	Enables a given EXTI line Example: <code>_HAL_PWR_PVD_EXTI_ENABLE_IT()</code>
_HAL_PPP_EXTI_DISABLE_IT	Disables a given EXTI line. Example: <code>_HAL_PWR_PVD_EXTI_DISABLE_IT()</code>
_HAL_PPP_EXTI_GET_FLAG	Gets a given EXTI line interrupt flag pending bit status. Example: <code>_HAL_PWR_PVD_EXTI_GET_FLAG()</code>

Macros	Description
<code>_HAL_PPP_EXTI_CLEAR_FLAG</code>	Clears a given EXTI line interrupt flag pending bit. Example: <code>_HAL_PWR_PVD_EXTI_CLEAR_FLAG()</code>
<code>_HAL_PPP_EXTI_GENERATE_SWIT</code>	Generates a software interrupt for a given EXTI line. Example: <code>_HAL_PWR_PVD_EXTI_GENERATE_SWIT()</code>
<code>_HAL_PPP_EXTI_ENABLE_EVENT</code>	Enables event on a given EXTI Line Example: <code>_HAL_PWR_PVD_EXTI_ENABLE_EVENT()</code>
<code>_HAL_PPP_EXTI_DISABLE_EVENT</code>	Disables event on a given EXTI line Example: <code>_HAL_PWR_PVD_EXTI_DISABLE_EVENT()</code>

If the EXTI interrupt mode is selected, the user application must call `HAL_PPP_FUNCTION_IRQHandler()` (for example `HAL_PWR_PVD_IRQHandler()`), from `stm32f3xx_it.c` file, and implement `HAL_PPP_FUNCTIONCallback()` callback function (for example `HAL_PWR_PVDCallback()`).

2.11.6 DMA

The DMA HAL driver allows enabling and configuring the peripheral to be connected to the DMA Channels (except for internal SRAM/FLASH memory which do not require any initialization). Refer to the product reference manual for details on the DMA request corresponding to each peripheral.

For a given channel, `HAL_DMA_Init()` API allows programming the required configuration through the following parameters:

- Transfer Direction
- Source and Destination data formats
- Circular, Normal or peripheral flow control mode
- Channels Priority level
- Source and Destination Increment mode
- FIFO mode and its Threshold (if needed)
- Burst mode for Source and/or Destination (if needed).

Two operating modes are available:

- Polling mode I/O operation
 - a. Use `HAL_DMA_Start()` to start DMA transfer when the source and destination addresses and the Length of data to be transferred have been configured.
 - b. Use `HAL_DMA_PollForTransfer()` to poll for the end of current transfer. In this case a fixed timeout can be configured depending on the user application.
- Interrupt mode I/O operation
 - a. Configure the DMA interrupt priority using `HAL_NVIC_SetPriority()`
 - b. Enable the DMA IRQ handler using `HAL_NVIC_EnableIRQ()`
 - c. Use `HAL_DMA_Start_IT()` to start DMA transfer when the source and destination addresses and the length of data to be transferred have been configured. In this case the DMA interrupt is configured.
 - d. Use `HAL_DMA_IRQHandler()` called under `DMA_IRQHandler()` Interrupt subroutine

- e. When data transfer is complete, HAL_DMA_IRQHandler() function is executed and a user function can be called by customizing XferCpltCallback and XferErrorCallback function pointer (i.e. a member of DMA handle structure).

Additional functions and macros are available to ensure efficient DMA management:

- Use HAL_DMA_GetState() function to return the DMA state and HAL_DMA_GetError() in case of error detection.
- Use HAL_DMA_Abort() function to abort the current transfer

The most used DMA HAL driver macros are the following:

- __HAL_DMA_ENABLE: enables the specified DMA Channels.
- __HAL_DMA_DISABLE: disables the specified DMA Channels.
- __HAL_DMA_GET_FLAG: gets the DMA Channels pending flags.
- __HAL_DMA_CLEAR_FLAG: clears the DMA Channels pending flags.
- __HAL_DMA_ENABLE_IT: enables the specified DMA Channels interrupts.
- __HAL_DMA_DISABLE_IT: disables the specified DMA Channels interrupts.
- __HAL_DMA_GET_IT_SOURCE: checks whether the specified DMA channel interrupt has occurred or not.

When a peripheral is used in DMA mode, the DMA initialization should be done in the HAL_PPP_MspInit() callback. In addition, the user application should associate the DMA handle to the PPP handle (refer to section “HAL IO operation functions”).

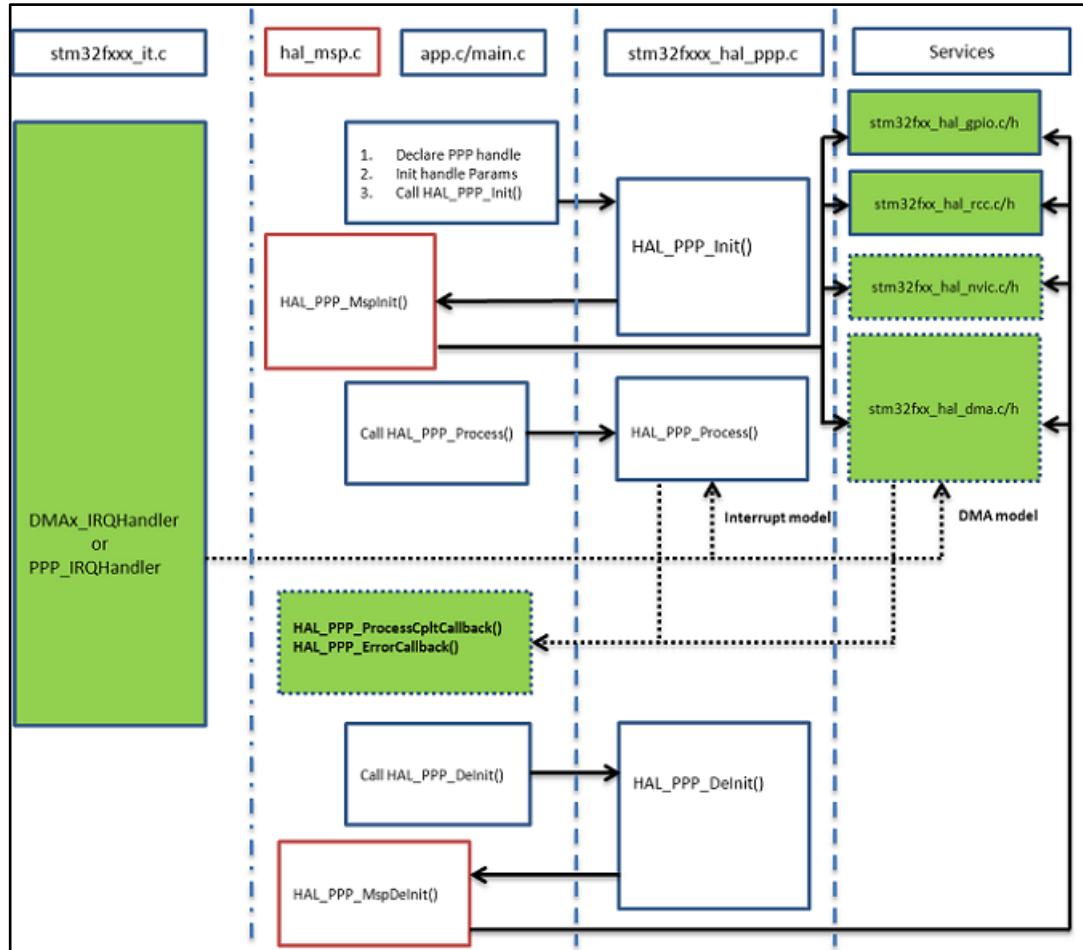

DMA channel callbacks need to be initialized by the user application only in case of memory-to-memory transfer. However when peripheral-to-memory transfers are used, these callbacks are automatically initialized by calling a process API function that uses the DMA.

2.12 How to use HAL drivers

2.12.1 HAL usage models

The following figure shows the typical use of the HAL driver and the interaction between the application user, the HAL driver and the interrupts.

Figure 7: HAL driver model

The functions implemented in the HAL driver are shown in green, the functions called from interrupt handlers in dotted lines, and the msp functions implemented in the user application in red. Non-dotted lines represent the interactions between the user application functions.

Basically, the HAL driver APIs are called from user files and optionally from interrupt handlers file when the APIs based on the DMA or the PPP peripheral dedicated interrupts are used.

When DMA or PPP peripheral interrupts are used, the PPP process complete callbacks are called to inform the user about the process completion in real-time event mode (interrupts). Note that the same process completion callbacks are used for DMA in interrupt mode.

2.12.2 HAL initialization

2.12.2.1 HAL global initialization

In addition to the peripheral initialization and de-initialization functions, a set of APIs are provided to initialize the HAL core implemented in file `stm32f3xx_hal.c`.

- `HAL_Init()`: this function must be called at application startup to
 - initialize data/instruction cache and pre-fetch queue
 - set Systick timer to generate an interrupt each 1ms (based on HSI clock) with the lowest priority
 - call `HAL_MspInit()` user callback function to perform system level initializations (Clock, GPIOs, DMA, interrupts). `HAL_MspInit()` is defined as “weak” empty function in the HAL drivers.
- `HAL_DeInit()`
 - resets all peripherals
 - calls function `HAL_MspDeInit()` which a is user callback function to do system level De-Initializations.
- `HAL_GetTick()`: this function gets current SysTick counter value (incremented in SysTick interrupt) used by peripherals drivers to handle timeouts.
- `HAL_Delay()`: this function implements a delay (expressed in milliseconds) using the SysTick timer.

Care must be taken when using `HAL_Delay()` since this function provides an accurate delay (expressed in milliseconds) based on a variable incremented in SysTick ISR. This means that if `HAL_Delay()` is called from a peripheral ISR, then the SysTick interrupt must have highest priority (numerically lower) than the peripheral interrupt, otherwise the caller ISR will be blocked.

2.12.2.2 System clock initialization

The clock configuration is done at the beginning of the user code. However the user can change the configuration of the clock in his own code. Please find below the typical Clock configuration sequence:

```
void SystemClock_Config(void)
{
  RCC_ClkInitTypeDef RCC_ClkInitStruct;
  RCC_OscInitTypeDef RCC_OscInitStruct;
  /* Enable HSE Oscillator and activate PLL with HSE as source */
  RCC_OscInitStruct.OscillatorType = RCC_OSCILLATORTYPE_HSE;
  RCC_OscInitStruct.HSEState = RCC_HSE_ON;
  RCC_OscInitStruct.HSEPredivValue = RCC_HSE_PREDIV_DIV1;
  RCC_OscInitStruct.PLL.PLLState = RCC_PLL_ON;
  RCC_OscInitStruct.PLL.PLLSource = RCC_PLLSOURCE_HSE;
  RCC_OscInitStruct.PLL.PLLMUL = RCC_PLL_MUL9;
  if (HAL_RCC_OscConfig(&RCC_OscInitStruct) != HAL_OK)
  {
    Error_Handler();
  }
  /* Select PLL as system clock source and configure the HCLK, PCLK1 and PCLK2
  clocks dividers */
  RCC_ClkInitStruct.ClockType = (RCC_CLOCKTYPE_SYSCLK | RCC_CLOCKTYPE_HCLK |
  RCC_CLOCKTYPE_PCLK1 | RCC_CLOCKTYPE_PCLK2);
  RCC_ClkInitStruct.SYSCLKSource = RCC_SYSCLKSOURCE_PLLCLK;
  RCC_ClkInitStruct.AHBCLKDivider = RCC_SYSCLK_DIV1;
  RCC_ClkInitStruct.APB1CLKDivider = RCC_HCLK_DIV2;
  RCC_ClkInitStruct.APB2CLKDivider = RCC_HCLK_DIV1;
  if (HAL_RCC_ClockConfig(&RCC_ClkInitStruct, FLASH_LATENCY_2) != HAL_OK)
  {
    Error_Handler();
  }
}
```

2.12.2.3 HAL MSP initialization process

The peripheral initialization is done through *HAL_PPP_Init()* while the hardware resources initialization used by a peripheral (PPP) is performed during this initialization by calling MSP callback function *HAL_PPP_MspInit()*.

The *MspInit* callback performs the low level initialization related to the different additional hardware resources: RCC, GPIO, NVIC and DMA.

All the HAL drivers with handles include two MSP callbacks for initialization and de-initialization:

```
/** 
 * @brief Initializes the PPP MSP.
 * @param hppp: PPP handle
 * @retval None */
void __weak HAL_PPP_MspInit(PPP_HandleTypeDefDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL PPP MspInit could be implemented in the user file */
}
/** 
 * @brief DeInitializes PPP MSP.
 * @param hppp: PPP handle
 * @retval None */
void __weak HAL_PPP_MspDeInit(PPP_HandleTypeDefDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL PPP MspDeInit could be implemented in the user file */
}
```

The MSP callbacks are declared empty as weak functions in each peripheral driver. The user can use them to set the low level initialization code or omit them and use his own initialization routine.

The HAL MSP callback is implemented inside the *stm32f3xx_hal_msp.c* file in the user folders. An *stm32f3xx_hal_msp_template.c* file is located in the HAL folder and should be copied to the user folder. It can be generated automatically by STM32CubeMX tool and further modified. Note that all the routines are declared as weak functions and could be overwritten or removed to use user low level initialization code.

stm32f3xx_hal_msp.c file contains the following functions:

Table 14: MSP functions

Routine	Description
void HAL_MspInit()	Global MSP initialization routine
void HAL_MspDeInit()	Global MSP de-initialization routine
void HAL_PPP_MspInit()	PPP MSP initialization routine
void HAL_PPP_MspDeInit()	PPP MSP de-initialization routine

By default, if no peripheral needs to be de-initialized during the program execution, the whole MSP initialization is done in *Hal_MspInit()* and MSP De-Initialization in the *Hal_MspDeInit()*. In this case the *HAL_PPP_MspInit()* and *HAL_PPP_MspDeInit()* are not implemented.

When one or more peripherals needs to be de-initialized in run time and the low level resources of a given peripheral need to be released and used by another peripheral, *HAL_PPP_MspDeInit()* and *HAL_PPP_MspInit()* are implemented for the concerned peripheral and other peripherals initialization and de-Initialization are kept in the global *HAL_MspInit()* and the *HAL_MspDeInit()*.

If there is nothing to be initialized by the global *HAL_MspInit()* and *HAL_MspDeInit()*, the two routines can simply be omitted.

2.12.3 HAL IO operation process

The HAL functions with internal data processing like transmit, receive, write and read are generally provided with three data processing modes as follows:

- Polling mode
- Interrupt mode
- DMA mode

2.12.3.1 Polling mode

In Polling mode, the HAL functions return the process status when the data processing in blocking mode is complete. The operation is considered complete when the function returns the HAL_OK status, otherwise an error status is returned. The user can get more information through the *HAL_PPP_GetState()* function. The data processing is handled internally in a loop. A timeout (expressed in ms) is used to prevent process hanging.

The example below shows the typical Polling mode processing sequence :

```
HAL_StatusTypeDef HAL_PPP_Transmit ( PPP_HandleTypeDef * phandle, uint8_t pData,
int16_t tSize, uint32_t tTimeout)
{
if((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
(...) while (data processing is running)
{
if( timeout reached )
{
return HAL_TIMEOUT;
}
}
(...)
return HAL_OK; }
```

2.12.3.2 Interrupt mode

In Interrupt mode, the HAL function returns the process status after starting the data processing and enabling the appropriate interruption. The end of the operation is indicated by a callback declared as a weak function. It can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function.

In Interrupt mode, four functions are declared in the driver:

- *HAL_PPP_Process_IT()*: launch the process
- *HAL_PPP_IRQHandler()*: the global PPP peripheral interruption
- *__weak HAL_PPP_ProcessCpltCallback ()*: the callback relative to the process completion.
- *__weak HAL_PPP_ProcessErrorCallback()*: the callback relative to the process Error.

To use a process in Interrupt mode, *HAL_PPP_Process_IT()* is called in the user file and *HAL_PPP_IRQHandler* in *stm32f3xx_it.c*.

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver. This means that the user can declare it again in the application. The function in the driver is not modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_SendIT(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
}
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *huart)
{
}
void HAL_UART_ErrorCallback(UART_HandleTypeDef *huart)
{}
```

stm32f3xx_it.c file:

```
extern UART_HandleTypeDef UartHandle;
void USART1_IRQHandler(void)
{
HAL_UART_IRQHandler(&UartHandle);
}
```

2.12.3.3 DMA mode

In DMA mode, the HAL function returns the process status after starting the data processing through the DMA and after enabling the appropriate DMA interruption. The end of the operation is indicated by a callback declared as a weak function and can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function. For the DMA mode, three functions are declared in the driver:

- *HAL_PPP_Process_DMA()*: launch the process
- *HAL_PPP_DMA_IRQHandler()*: the DMA interruption used by the PPP peripheral
- *__weak HAL_PPP_ProcessCpltCallback()*: the callback relative to the process completion.
- *__weak HAL_PPP_ErrorCpltCallback()*: the callback relative to the process Error.

To use a process in DMA mode, *HAL_PPP_Process_DMA()* is called in the user file and the *HAL_PPP_DMA_IRQHandler()* is placed in the *stm32f3xx_it.c*. When DMA mode is used, the DMA initialization is done in the *HAL_PPP_MspInit()* callback. The user should also associate the DMA handle to the PPP handle. For this purpose, the handles of all the peripheral drivers that use the DMA must be declared as follows:

```
typedef struct
{
PPP_TypeDef *Instance; /* Register base address */
PPP_InitTypeDef Init; /* PPP communication parameters */
HAL_StateTypeDef State; /* PPP communication state */
(...)

DMA_HandleTypeDef *hdma; /* associated DMA handle */
} PPP_HandleTypeDef;
```

The initialization is done as follows (UART example):

```
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
(...)
```

```
void HAL_USART_MspInit(UART_HandleTypeDef *huart)
{
static DMA_HandleTypeDef hdma_tx;
static DMA_HandleTypeDef hdma_rx;
(...)
__HAL_LINKDMA(UartHandle, DMA_Handle_tx, hdma_tx);
__HAL_LINKDMA(UartHandle, DMA_Handle_rx, hdma_rx);
(...)
```

}

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver that means, the user can declare it again in the application code. The function in the driver should not be modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX; UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_Send_DMA(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
```

```
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *phuart)
{}
```

```
void HAL_UART_TxErrorCallback(UART_HandleTypeDef *phuart)
{}
```

stm32f3xx_it.c file:

```
extern UART_HandleTypeDef UartHandle;
void DMAx_IRQHandler(void)
{
HAL_DMA_IRQHandler(&UartHandle.DMA_HandleTypeDef_tx);
```

HAL_USART_TxCpltCallback() and *HAL_USART_ErrorCallback()* should be linked in the *HAL_PPP_Process_DMA()* function to the DMA transfer complete callback and the DMA transfer Error callback by using the following statement:

```
HAL_PPP_Process_DMA (PPP_HandleTypeDef *hppp, Params...)
{
(...)
```

```
hppp->DMA_HandleTypeDef->XferCpltCallback = HAL_UART_TxCpltCallback ;
hppp->DMA_HandleTypeDef->XferErrorCallback = HAL_UART_ErrorCallback ;
```

```
(...)
}
```

2.12.4 Timeout and error management

2.12.4.1 Timeout management

The timeout is often used for the APIs that operate in polling mode. It defines the delay during which a blocking process should wait till an error is returned. An example is provided below:

```
HAL_StatusTypeDef HAL_DMA_PollForTransfer(DMA_HandleTypeDef *hdma, uint32_t CompleteLevel, uint32_t Timeout)
```

The timeout possible value are the following:

Table 15: Timeout values

Timeout value	Description
0	No poll : Immediate process check and exit
1 ... (HAL_MAX_DELAY -1) ⁽¹⁾	Timeout in ms
HAL_MAX_DELAY	Infinite poll till process is successful

Notes:

⁽¹⁾HAL_MAX_DELAY is defined in the stm32fxx_hal_def.h as 0xFFFFFFFF

However, in some cases, a fixed timeout is used for system peripherals or internal HAL driver processes. In these cases, the timeout has the same meaning and is used in the same way, except when it is defined locally in the drivers and cannot be modified or introduced as an argument in the user application.

Example of fixed timeout:

```
#define LOCAL_PROCESS_TIMEOUT 100
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef)
{
(
...
timeout = HAL_GetTick() + LOCAL_PROCESS_TIMEOUT;
(
...
while(ProcessOngoing)
{
(
...
if(HAL_GetTick() >= timeout)
{
/* Process unlocked */
HAL_UNLOCK(hppp);
hppp->State= HAL_PPP_STATE_TIMEOUT;
return HAL_PPP_STATE_TIMEOUT;
}
(
...
}
```

The following example shows how to use the timeout inside the polling functions:

```
HAL_PPP_StateTypeDef HAL_PPP_Poll (PPP_HandleTypeDef *hppp, uint32_t Timeout)
{
(
...
timeout = HAL_GetTick() + Timeout;
(
...
while(ProcessOngoing)
{
(
...
if(Timeout != HAL_MAX_DELAY)
{
```

```

if(HAL_GetTick() >= timeout)
{
/* Process unlocked */
__HAL_UNLOCK(hppp);
hppp->State= HAL PPP STATE TIMEOUT;
return hppp->State;
}
}
(...)
```

2.12.4.2 Error management

The HAL drivers implement a check on the following items:

- Valid parameters: for some process the used parameters should be valid and already defined, otherwise the system may crash or go into an undefined state. These critical parameters are checked before being used (see example below).

```

HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef* hppp, uint32_t *pdata, uint32
Size)
{ if ((pData == NULL) || (Size == 0))
{ return HAL_ERROR;
}
```

- Valid handle: the PPP peripheral handle is the most important argument since it keeps the PPP driver vital parameters. It is always checked in the beginning of the *HAL_PPP_Init()* function.

```

HAL_StatusTypeDef HAL_PPP_Init(PPP_HandleTypeDef* hppp)
{ if (hppp == NULL) /*the handle should be already allocated
{ return HAL_ERROR;
}
```

- Timeout error: the following statement is used when a timeout error occurs:

```

while (Process ongoing)
{ timeout = HAL_GetTick() + Timeout;
  while (data processing is running)
{ if(timeout)
{ return HAL_TIMEOUT;
}
}
```

When an error occurs during a peripheral process, *HAL_PPP_Process()* returns with a *HAL_ERROR* status. The HAL PPP driver implements the *HAL_PPP_GetError()* to allow retrieving the origin of the error.

```
HAL_PPP_ErrorTypeDef HAL_PPP_GetError (PPP_HandleTypeDef *hppp);
```

In all peripheral handles, a *HAL_PPP_ErrorTypeDef* is defined and used to store the last error code.

```

typedef struct
{
PPP_TypeDef * Instance; /* PPP registers base address */
PPP_InitTypeDef Init; /* PPP initialization parameters */
HAL_LockTypeDef Lock; /* PPP locking object */
__IO HAL_PPP_StateTypeDef State; /* PPP state */
__IO HAL_PPP_ErrorTypeDef ErrorCode; /* PPP Error code */
(...)
/* PPP specific parameters */
}
PPP_HandleTypeDef;
```

The error state and the peripheral global state are always updated before returning an error:

```
PPP->State = HAL_PPP_READY; /* Set the peripheral ready */
PPP->ErrorCode = HAL_ERRORCODE ; /* Set the error code */
HAL_UNLOCK(PPP) ; /* Unlock the PPP resources */
return HAL_ERROR; /*return with HAL error */
```

HAL_PPP_GetError () must be used in interrupt mode in the error callback:

```
void HAL_PPP_ProcessCpltCallback(PPP_HandleTypeDef *hspi)
{
    ErrorCode = HAL_PPP_GetError (hppp); /* retreive error code */
}
```

2.12.4.3 Run-time checking

The HAL implements run-time failure detection by checking the input values of all HAL driver functions. The run-time checking is achieved by using an *assert_param* macro. This macro is used in all the HAL drivers' functions which have an input parameter. It allows verifying that the input value lies within the parameter allowed values.

To enable the run-time checking, use the *assert_param* macro, and leave the define **USE_FULL_ASSERT** uncommented in *stm32f3xx_hal_conf.h* file.

```
void HAL_UART_Init(UART_HandleTypeDef *huart)
{
    (...) /* Check the parameters */
    assert_param(IS_UART_INSTANCE(huart->Instance));
    assert_param(IS_UART_BAUDRATE(huart->Init.BaudRate));
    assert_param(IS_UART_WORD_LENGTH(huart->Init.WordLength));
    assert_param(IS_UART_STOPBITS(huart->Init.StopBits));
    assert_param(IS_UART_PARITY(huart->Init.Parity));
    assert_param(IS_UART_MODE(huart->Init.Mode));
    assert_param(IS_UART_HARDWARE_FLOW_CONTROL(huart->Init.HwFlowCtl));
    (...)

    /** @defgroup UART_Word_Length *
     @{
     */
#define UART_WORDLENGTH_8B ((uint32_t)0x00000000)
#define UART_WORDLENGTH_9B ((uint32_t)USART_CR1_M)
#define IS_UART_WORD_LENGTH(LENGTH) (((LENGTH) == UART_WORDLENGTH_8B) ||
\ ((LENGTH) == UART_WORDLENGTH_9B))
```

If the expression passed to the *assert_param* macro is false, the *assert_failed* function is called and returns the name of the source file and the source line number of the call that failed. If the expression is true, no value is returned.

The *assert_param* macro is implemented in *stm32f3xx_hal_conf.h*:

```
/* Exported macro -----
#ifndef USE_FULL_ASSERT
/***
 * @brief The assert param macro is used for function's parameters check.
 * @param expr: If expr is false, it calls assert failed function
 * which reports the name of the source file and the source
 * line number of the call that failed.
 * If expr is true, it returns no value.
 * @retval None */
#define assert_param(expr) ((expr)?(void)0:assert_failed((uint8_t *) FILE ,
LINE))
/* Exported functions -----*/
void assert_failed(uint8_t * file, uint32_t line);
#else
#define assert_param(expr)((void)0)
#endif /* USE_FULL_ASSERT */
```

The `assert_failed` function is implemented in the main.c file or in any other user C file:

```
#ifdef USE_FULL_ASSERT /**
 * @brief Reports the name of the source file and the source line number
 * where the assert_param error has occurred.
 * @param file: pointer to the source file name
 * @param line: assert param error line source number
 * @retval None */
void assert_failed(uint8_t* file, uint32_t line)
{
/* User can add his own implementation to report the file name and line number,
ex: printf("Wrong parameters value: file %s on line %d\r\n", file, line) */
/* Infinite loop */
while (1)
{
}
```

Because of the overhead run-time checking introduces, it is recommended to use it during application code development and debugging, and to remove it from the final application to improve code size and speed.

3 Overview of low-layer drivers

The low-layer (LL) drivers are designed to offer a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. Contrary to the HAL, LL APIs are not provided for peripherals where optimized access is not a key feature, or those requiring heavy software configuration and/or complex upper-level stack (such as FSMC or USB).

The LL drivers feature:

- A set of functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Functions to perform peripheral de-initialization (peripheral registers restored to their default values)
- A set of inline functions for direct and atomic register access
- Full independence from HAL since LL drivers can be used either in standalone mode (without HAL drivers) or in mixed mode (with HAL drivers)
- Full coverage of the supported peripheral features.

The low-layer drivers provide hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities and provide one-shot operations that must be called following the programming model described in the microcontroller line reference manual. As a result, the LL services do not implement any processing and do not require any additional memory resources to save their states, counter or data pointers: all the operations are performed by changing the associated peripheral registers content.

3.1 Low-layer files

The low-layer drivers are built around header/C files (one per each supported peripheral) plus five header files for some System and Cortex related features.

Table 16: LL driver files

File	Description
<i>stm32f3xx_ll_bus.h</i>	This is the h-source file for core bus control and peripheral clock activation and deactivation <i>Example: LL_AHB1_GRP1_EnableClock</i>
<i>stm32f3xx_ll_ppp.h/c</i>	<i>stm32f3xx_ll_ppp.c</i> provides peripheral initialization functions such as LL_PPP_Init(), LL_PPP_StructInit(), LL_PPP_DelInit(). All the other APIs are defined within <i>stm32f3xx_ll_ppp.h</i> file. The low-layer PPP driver is a standalone module. To use it, the application must include it in the <i>xx_ll_ppp.h</i> file.
<i>stm32xx_ll_cortex.h</i>	CortexM related register operation APIs including the Systick, Low power (LL_SYSTICK_xxxxx, LL_LPM_xxxxx "Low Power Mode" ...)
<i>stm32xx_ll_xx_ll_utils.h/c</i>	This file covers the generic APIs: <ul style="list-style-type: none"> • Read of device unique ID and electronic signature • Timebase and delay management • System clock configuration.
<i>stm32xx_ll_xx_ll_system.h</i>	System related operations (LL_SYSCFG_xxx, LL_DBGMCU_xxx, LL_FLASH_xxx)

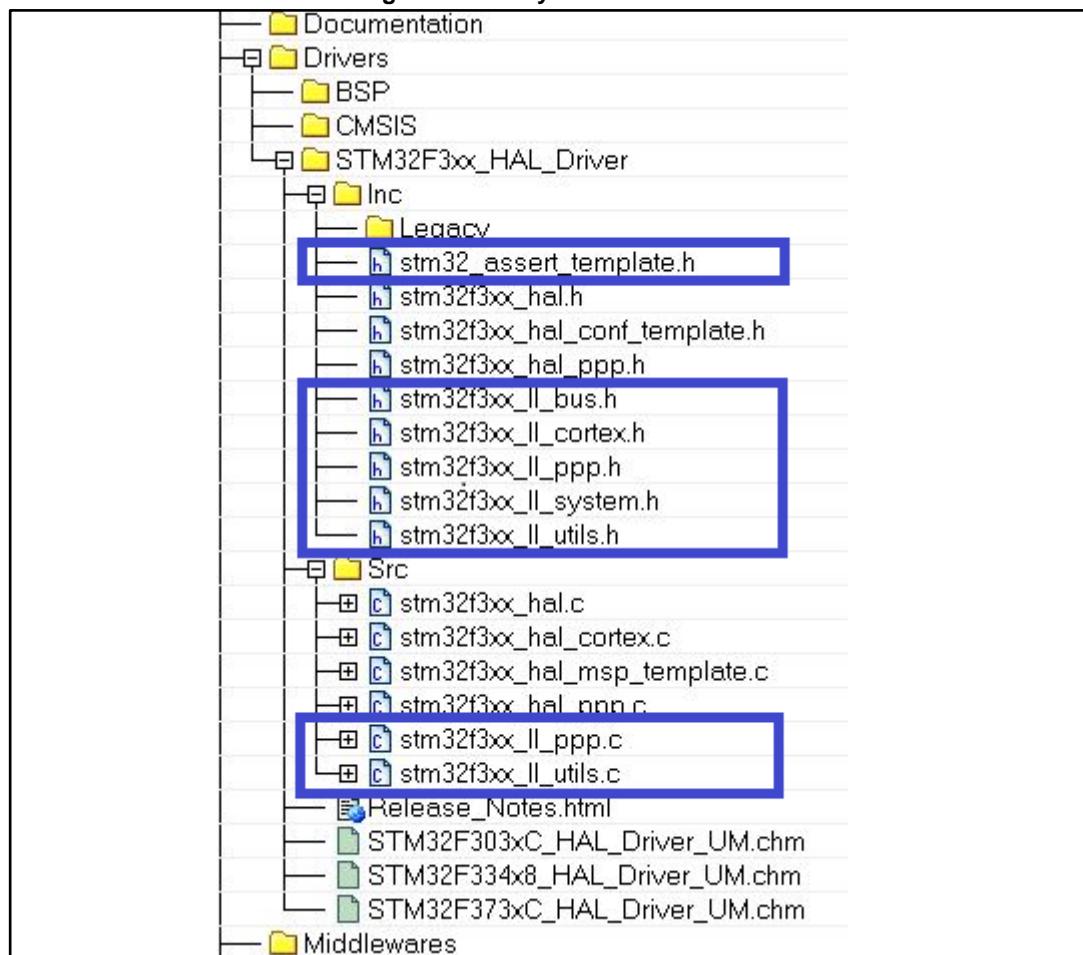

File	Description
stm32_assert_template.h	Template file allowing to define the assert_param macro, that is used when run-time checking is enabled. This file is required only when the LL drivers are used in standalone mode (without calling the HAL APIs). It should be copied to the application folder and renamed to stm32_assert.h.

There is no configuration file for the LL drivers.

The low-layer files are located in the same HAL driver folder.

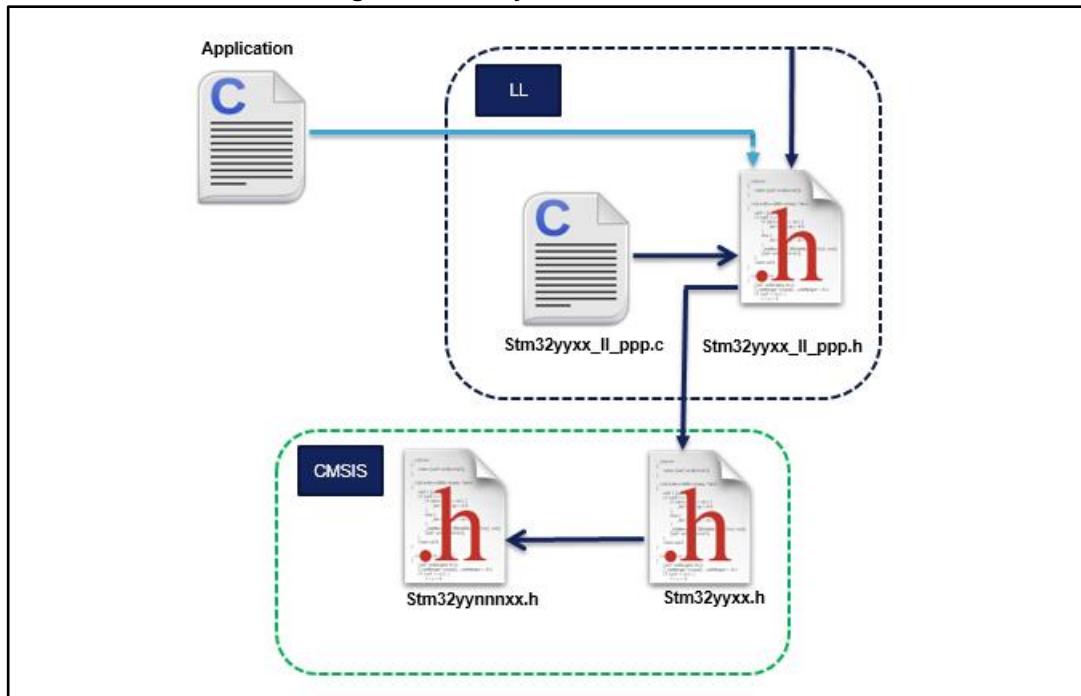

Figure 8: low-layer driver folders

In general, low-layer drivers include only the STM32 CMSIS device file.

```
#include "stm32yyxx.h"
```

Figure 9: Low-layer driver CMSIS files

Application files have to include only the used low-layer drivers header files.

3.2 Overview of low-layer APIs and naming rules

3.2.1 Peripheral initialization functions

The LL drivers offer three sets of initialization functions. They are defined in `stm32f3xx_ll_ppp.c` file:

- Functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Function for peripheral de-initialization (peripheral registers restored to their default values)

The definition of these LL initialization functions and associated resources (structure, literals and prototypes) is conditioned by a compilation switch: `USE_FULL_LL_DRIVER`. To use these functions, this switch must be added in the toolchain compiler preprocessor or to any generic header file which is processed before the LL drivers.

The below table shows the list of the common functions provided for all the supported peripherals:

Table 17: Common peripheral initialization functions

Functions	Return Type	Parameters	Description
LL_PPP_Init	ErrorStatus	<ul style="list-style-type: none"> • <i>PPP_TypeDef* PPPx</i> • <i>LL_PPP_InitTypeDef* PPP_InitStruct</i> 	Initializes the peripheral main features according to the parameters specified in PPP_InitStruct. Example: LL_USART_Init(USART_TypeDef *USARTx, LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_StructInit	void	<ul style="list-style-type: none"> • <i>LL_PPP_InitTypeDef* PPP_InitStruct</i> 	Fills each PPP_InitStruct member with its default value. Example. LL_USART_StructInit(LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_DeInit	ErrorStatus	<ul style="list-style-type: none"> • <i>PPP_TypeDef* PPPx</i> 	De-initializes the peripheral registers, that is restore them to their default reset values. Example. LL_USART_DeInit(USART_TypeDef *USARTx)

Additional functions are available for some peripherals (refer to [Table 18: "Optional peripheral initialization functions"](#))

Table 18: Optional peripheral initialization functions

Functions	Return Type	Parameters	Examples
LL_PPP{CATEGORY}_Init	Error Status	<ul style="list-style-type: none"> • <i>PPP_TypeDef* PPPx</i> • <i>LL_PPP{CATEGORY}_InitTypeDef* PPP{CATEGORY}_InitStruct</i> 	<p>Initializes peripheral features according to the parameters specified in PPP_InitStruct.</p> <p>Example:</p> <p>LL_ADC_INJ_Init(ADC_TypeDef *ADCx, LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct)</p> <p>LL_RTC_TIME_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_TimeTypeDef *RTC_TimeStruct)</p> <p>LL_RTC_DATE_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_DateTypeDef *RTC_DateStruct)</p> <p>LL_TIM_IC_Init(TIM_TypeDef* TIMx, uint32_t Channel, LL_TIM_IC_InitTypeDef* TIM_IC_InitStruct)</p> <p>LL_TIM_ENCODER_Init(TIM_TypeDef* TIMx, LL_TIM_ENCODER_InitTypeDef* TIM_EncoderInitStruct)</p>

Functions	Return Type	Parameters	Examples
LL_PPP_{CATEGORY}_StructInit	void	<i>LL_PPP_{CATEGORY}_InitTypeDef*</i> <i>PPP_{CATEGORY}_InitStruct</i>	Fills each <i>PPP_{CATEGORY}_InitStruct</i> member with its default value. Example: <code>LL_ADC_INJ_StructInit(LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct)</code>
LL_PPP_CommonInit	Error Status	<ul style="list-style-type: none"> • <i>PPP_TypeDef* PPPx</i> • <i>LL_PPP_CommonInitTypeDef*</i> <i>PPP_CommonInitStruct</i> 	Initializes the common features shared between different instances of the same peripheral. Example: <code>LL_ADC_CommonInit(ADC_Common_TypeDef *ADCxy_COMMON, LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)</code>
LL_PPP_CommonStructInit	void	<i>LL_PPP_CommonInitTypeDef*</i> <i>PPP_CommonInitStruct</i>	Fills each <i>PPP_CommonInitStruct</i> member with its default value Example: <code>LL_ADC_CommonStructInit(LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)</code>
LL_PPP_ClockInit	Error Status	<ul style="list-style-type: none"> • <i>PPP_TypeDef* PPPx</i> • <i>LL_PPP_ClockInitTypeDef*</i> <i>PPP_ClockInitStruct</i> 	Initializes the peripheral clock configuration in synchronous mode. Example: <code>LL_USART_ClockInit(USART_TypeDef *USARTx, LL_USART_ClockInitTypeDef *USART_ClockInitStruct)</code>
LL_PPP_ClockStructInit	void	<i>LL_PPP_ClockInitTypeDef*</i> <i>PPP_ClockInitStruct</i>	Fills each <i>PPP_ClockInitStruct</i> member with its default value Example: <code>LL_USART_ClockStructInit(LL_USART_ClockInitTypeDef *USART_ClockInitStruct)</code>

3.2.1.1 Run-time checking

Like HAL drivers, LL initialization functions implement run-time failure detection by checking the input values of all LL driver functions. For more details please refer to [Section 2.12.4.3: "Run-time checking"](#).

When using the LL drivers in standalone mode (without calling HAL functions), the following actions are required to use run-time checking:

1. Copy `stm32_assert_template.h` to the application folder and rename it to `stm32_assert.h`. This file defines the `assert_param` macro which is used when run-time checking is enabled.
2. Include `stm32_assert.h` file within the application main header file.
3. Add the `USE_FULL_ASSERT` compilation switch in the toolchain compiler preprocessor or in any generic header file which is processed before the `stm32_assert.h` driver.

Run-time checking is not available for LL inline functions.

3.2.2 Peripheral register-level configuration functions

On top of the peripheral initialization functions, the LL drivers offer a set of inline functions for direct atomic register access. Their format is as follows:

```
_STATIC_INLINE return_type LL_PPP_Function (PPPx_TypeDef *PPPx, args)
```

The “Function” naming is defined depending to the action category:

- **Specific Interrupt, DMA request and status flags management:**
Set/Get/Clear/Enable/Disable flags on interrupt and status registers

Table 19: Specific Interrupt, DMA request and status flags management

Name	Examples
<code>LL_PPP_{_CATEGORY}_ActionItem_BITNAME</code>	<ul style="list-style-type: none"> • <code>LL_RCC_IsActiveFlag_LSIRDY</code> • <code>LL_RCC_IsActiveFlag_FWRST()</code> • <code>LL_ADC_ClearFlag_EOC(ADC1)</code> • <code>LL_DMA_ClearFlag_TCx(DMA_TypeDef* DMAx)</code>
<code>LL_PPP{_CATEGORY}_IsItem_BITNAME_Action</code>	

Table 20: Available function formats

Item	Action	Format
Flag	Get	<code>LL_PPP_IsActiveFlag_BITNAME</code>
	Clear	<code>LL_PPP_ClearFlag_BITNAME</code>
Interrupts	Enable	<code>LL_PPP_EnableIT_BITNAME</code>
	Disable	<code>LL_PPP_DisableIT_BITNAME</code>
	Get	<code>LL_PPP_IsEnabledIT_BITNAME</code>
DMA	Enable	<code>LL_PPP_EnableDMAReq_BITNAME</code>
	Disable	<code>LL_PPP_DisableDMAReq_BITNAME</code>
	Get	<code>LL_PPP_IsEnabledDMAReq_BITNAME</code>

BITNAME refers to the peripheral register bit name as described in the product line reference manual.

- **Peripheral clock activation/deactivation management:** Enable/Disable/Reset a peripheral clock

Table 21: Peripheral clock activation/deactivation management

Name	Examples
<code>LL_bus_GRPx_ActionClock{Mode}</code>	<ul style="list-style-type: none"> • <code>LL_AHB1_GRP1_EnableClock (LL_AHB1_GRP1_PERIPH_GPIOA LL_AHB1_GRP1_PERIPH_GPIOB)</code> • <code>LL_APB1_GRP1_EnableClockSleep (LL_APB1_GRP1_PERIPH_DAC1)</code>

'x' corresponds to the group index and refers to the index of the modified register on a given bus.

'bus' correspond to the bus name (for example APB1).

- **Peripheral activation/deactivation management:** Enable/disable a peripheral or activate/deactivate specific peripheral features

Table 22: Peripheral activation/deactivation management

Name	Examples
<code>LL_PPP{CATEGORY}_Action{Item}</code> <code>LL_PPP{CATEGORY}_IsItemAction</code>	<ul style="list-style-type: none"> • <code>LL_ADC_Enable()</code> • <code>LL_ADC_StartCalibration();</code> • <code>LL_ADC_IsCalibrationOnGoing();</code> • <code>LL_RCC_HSI_Enable()</code> • <code>LL_RCC_HSI_IsReady()</code>

- **Peripheral configuration management:** Set/get a peripheral configuration settings

Table 23: Peripheral configuration management

Name	Examples
<code>LL_PPP{CATEGORY}_Set{ or Get}ConfigItem</code>	<code>LL_USART_SetBaudRate(USART2, 16000000,</code> <code>LL_USART_OVERSAMPLING_16, 9600)</code>

- **Peripheral register management:** Write/read the content of a register/retrun DMA relative register address

Table 24: Peripheral register management

Name
<code>LL_PPP_WriteReg(__INSTANCE__, __REG__, __VALUE__)</code>
<code>LL_PPP_ReadReg(__INSTANCE__, __REG__)</code>
<code>LL_PPP_DMA_GetRegAddr(PPP_TypeDef *PPPx, {Sub Instance if any ex: Channel}, {uint32_t Proprietary})</code>

The Proprietary is a variable used to identify the DMA transfer direction or the data register type.

4 Cohabiting of HAL and LL

The low-layer APIs are designed to be used in standalone mode or combined with the HAL. They cannot be automatically used with the HAL for the same peripheral instance. If you use the LL APIs for a specific instance, you can still use the HAL APIs for other instances. Be careful that the low-layer APIs might overwrite some registers which content is mirrored in the HAL handles.

4.1 Low-layer driver used in standalone mode

The low-layer APIs can be used without calling the HAL driver services. This is done by simply including `stm32f3xx_ll_ppp.h` in the application files. The LL APIs for a given peripheral are called by executing the same sequence as the one recommended by the programming model in the corresponding product line reference manual. In this case the HAL drivers associated to the used peripheral can be removed from the workspace. However the STM32CubeF3 framework should be used in the same way as in the HAL drivers case which means that System file, startup file and CMSIS should always be used.

When the BSP drivers are included, the used HAL drivers associated with the BSP functions drivers should be included in the workspace, even if they are not used by the application layer.

4.2 Mixed use of low-layer APIs and HAL drivers

In this case the low-layer APIs are used in conjunction with the HAL drivers to achieve direct and register level based operations.

Mixed use is allowed, however some consideration should be taken into account:

- It is recommended to avoid using simultaneously the HAL APIs and the combination of low-layer APIs for a given peripheral instance. If this is the case, one or more private fields in the HAL PPP handle structure should be updated accordingly.
- For operations and processes that do not alter the handle fields including the initialization structure, the HAL driver APIs and the low-layer services can be used together for the same peripheral instance.
- The low-layer drivers can be used without any restriction with all the HAL drivers that are not based on handle objects (RCC, common HAL, flash and GPIO).

Several examples showing how to use HAL and LL in the same application are provided within STM32F3 firmware package (refer to Examples_MIX projects).

1. When the HAL Init/DeInit APIs are not used and are replaced by the low-layer macros, the `InitMsp()` functions are not called and the MSP initialization should be done in the user application.
2. When process APIs are not used and the corresponding function is performed through the low-layer APIs, the callbacks are not called and post processing or error management should be done by the user application.
3. When the LL APIs are used for process operations, the IRQ handler HAL APIs cannot be called and the IRQ should be implemented by the user application. Each LL driver implements the macros needed to read and clear the associated interrupt flags.

5 HAL System Driver

5.1 HAL Firmware driver API description

5.1.1 How to use this driver

The common HAL driver contains a set of generic and common APIs that can be used by the PPP peripheral drivers and the user to start using the HAL.

The HAL contains two APIs categories:

- HAL Initialization and de-initialization functions
- HAL Control functions

5.1.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initializes the Flash interface, the NVIC allocation and initial clock configuration. It initializes the source of time base also when timeout is needed and the backup domain when enabled.
- de-Initializes common part of the HAL.
- Configure The time base source to have 1ms time base with a dedicated Tick interrupt priority.
 - Systick timer is used by default as source of time base, but user can eventually implement his proper time base source (a general purpose timer for example or other time source), keeping in mind that Time base duration should be kept 1ms since PPP_TIMEOUT_VALUES are defined and handled in milliseconds basis.
 - Time base configuration function (HAL_InitTick ()) is called automatically at the beginning of the program after reset by HAL_Init() or at any time when clock is configured, by HAL_RCC_ClockConfig().
 - Source of time base is configured to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, the Tick interrupt line must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked.
 - functions affecting time base configurations are declared as __Weak to make override possible in case of other implementations in user file.

This section contains the following APIs:

- [**HAL_Init\(\)**](#)
- [**HAL_DeInit\(\)**](#)
- [**HAL_MspInit\(\)**](#)
- [**HAL_MspDeInit\(\)**](#)
- [**HAL_InitTick\(\)**](#)

5.1.3 HAL Control functions

This section provides functions allowing to:

- Provide a tick value in millisecond
- Provide a blocking delay in millisecond
- Suspend the time base source interrupt
- Resume the time base source interrupt
- Get the HAL API driver version
- Get the device identifier

- Get the device revision identifier
- Enable/Disable Debug module during Sleep mode
- Enable/Disable Debug module during STOP mode
- Enable/Disable Debug module during STANDBY mode

This section contains the following APIs:

- *[HAL_IncTick\(\)](#)*
- *[HAL_GetTick\(\)](#)*
- *[HAL_Delay\(\)](#)*
- *[HAL_SuspendTick\(\)](#)*
- *[HAL_ResumeTick\(\)](#)*
- *[HAL_GetHalVersion\(\)](#)*
- *[HAL_GetREVID\(\)](#)*
- *[HAL_GetDEVID\(\)](#)*
- *[HAL_GetUIDw0\(\)](#)*
- *[HAL_GetUIDw1\(\)](#)*
- *[HAL_GetUIDw2\(\)](#)*
- *[HAL_DBGMCU_EnableDBGSleepMode\(\)](#)*
- *[HAL_DBGMCU_DisableDBGSleepMode\(\)](#)*
- *[HAL_DBGMCU_EnableDBGStopMode\(\)](#)*
- *[HAL_DBGMCU_DisableDBGStopMode\(\)](#)*
- *[HAL_DBGMCU_EnableDBGStandbyMode\(\)](#)*
- *[HAL_DBGMCU_DisableDBGStandbyMode\(\)](#)*

5.1.4 Detailed description of functions

HAL_Init

Function name	HAL_StatusTypeDef HAL_Init (void)
Function description	This function configures the Flash prefetch, Configures time base source, NVIC and Low level hardware.
Return values	<ul style="list-style-type: none"> • HAL: status
Notes	<ul style="list-style-type: none"> • This function is called at the beginning of program after reset and before the clock configuration • The Systick configuration is based on HSI clock, as HSI is the clock used after a system Reset and the NVIC configuration is set to Priority group 4 • The time base configuration is based on MSI clock when exiting from Reset. Once done, time base tick start incrementing. In the default implementation,Systick is used as source of time base. The tick variable is incremented each 1ms in its ISR.

HAL_DeInit

Function name	HAL_StatusTypeDef HAL_DeInit (void)
Function description	This function de-Initializes common part of the HAL and stops the source of time base.
Return values	<ul style="list-style-type: none"> • HAL: status
Notes	<ul style="list-style-type: none"> • This function is optional.

HAL_MspInit

Function name **void HAL_MspInit (void)**

Function description Initializes the MSP.

Return values • **None**

HAL_MspDeInit

Function name **void HAL_MspDeInit (void)**

Function description DeInitializes the MSP.

Return values • **None**

HAL_InitTick

Function name **HAL_StatusTypeDef HAL_InitTick (uint32_t TickPriority)**

Function description This function configures the source of the time base.

- **TickPriority:** Tick interrupt priority.
- **HAL:** status
- This function is called automatically at the beginning of program after reset by HAL_Init() or at any time when clock is reconfigured by HAL_RCC_ClockConfig().
- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, The the SysTick interrupt must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked. The function is declared as __Weak to be overwritten in case of other implementation in user file.

HAL_IncTick

Function name **void HAL_IncTick (void)**

Function description This function is called to increment a global variable "uwTick" used as application time base.

Return values • **None**

- Notes
- In the default implementation, this variable is incremented each 1ms in Systick ISR.
 - This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_Delay

Function name **void HAL_Delay (__IO uint32_t Delay)**

Function description This function provides accurate delay (in milliseconds) based on variable incremented.

Parameters • **Delay:** specifies the delay time length, in milliseconds.

Return values	None
Notes	<ul style="list-style-type: none"> In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals where uwTick is incremented. The function is declared as __Weak to be overwritten in case of other implementations in user file.

HAL_SuspendTick

Function name	void HAL_SuspendTick (void)
Function description	Suspend Tick increment.
Return values	None
Notes	<ul style="list-style-type: none"> In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_SuspendTick() is called, the the SysTick interrupt will be disabled and so Tick increment is suspended. This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_ResumeTick

Function name	void HAL_ResumeTick (void)
Function description	Resume Tick increment.
Return values	None
Notes	<ul style="list-style-type: none"> In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_ResumeTick() is called, the the SysTick interrupt will be enabled and so Tick increment is resumed. The function is declared as __Weak to be overwritten in case of other implementations in user file.

HAL_GetTick

Function name	uint32_t HAL_GetTick (void)
Function description	Povides a tick value in millisecond.
Return values	tick: value
Notes	<ul style="list-style-type: none"> The function is declared as __Weak to be overwritten in case of other implementations in user file.

HAL_GetHalVersion

Function name	uint32_t HAL_GetHalVersion (void)
Function description	This function returns the HAL revision.
Return values	<ul style="list-style-type: none"> version: : 0xXYZR (8bits for each decimal, R for RC)

HAL_GetREVID

Function name	uint32_t HAL_GetREVID (void)
Function description	Returns the device revision identifier.
Return values	<ul style="list-style-type: none">• Device: revision identifier

HAL_GetDEVID

Function name	uint32_t HAL_GetDEVID (void)
Function description	Returns the device identifier.
Return values	<ul style="list-style-type: none">• Device: identifier

HAL_GetUIDw0

Function name	uint32_t HAL_GetUIDw0 (void)
Function description	Returns first word of the unique device identifier (UID based on 96 bits)
Return values	<ul style="list-style-type: none">• Device: identifier

HAL_GetUIDw1

Function name	uint32_t HAL_GetUIDw1 (void)
Function description	Returns second word of the unique device identifier (UID based on 96 bits)
Return values	<ul style="list-style-type: none">• Device: identifier

HAL_GetUIDw2

Function name	uint32_t HAL_GetUIDw2 (void)
Function description	Returns third word of the unique device identifier (UID based on 96 bits)
Return values	<ul style="list-style-type: none">• Device: identifier

HAL_DBGMCU_EnableDBGSleepMode

Function name	void HAL_DBGMCU_EnableDBGSleepMode (void)
Function description	Enable the Debug Module during SLEEP mode.
Return values	<ul style="list-style-type: none">• None

HAL_DBGMCU_DisableDBGSleepMode

Function name	void HAL_DBGMCU_DisableDBGSleepMode (void)
Function description	Disable the Debug Module during SLEEP mode.
Return values	<ul style="list-style-type: none">• None

HAL_DBGMCU_EnableDBGStopMode

Function name **void HAL_DBGMCU_EnableDBGStopMode (void)**

Function description Enable the Debug Module during STOP mode.

Return values • **None**

HAL_DBGMCU_DisableDBGStopMode

Function name **void HAL_DBGMCU_DisableDBGStopMode (void)**

Function description Disable the Debug Module during STOP mode.

Return values • **None**

HAL_DBGMCU_EnableDBGStandbyMode

Function name **void HAL_DBGMCU_EnableDBGStandbyMode (void)**

Function description Enable the Debug Module during STANDBY mode.

Return values • **None**

HAL_DBGMCU_DisableDBGStandbyMode

Function name **void HAL_DBGMCU_DisableDBGStandbyMode (void)**

Function description Disable the Debug Module during STANDBY mode.

Return values • **None**

6.2 ADC Firmware driver API description

6.2.1 ADC peripheral features

- 12-bit, 10-bit, 8-bit or 6-bit configurable resolution (available only on STM32F30xxC devices).
- Interrupt generation at the end of regular conversion, end of injected conversion, and in case of analog watchdog or overrun events.
- Single and continuous conversion modes.
- Scan mode for conversion of several channels sequentially.
- Data alignment with in-built data coherency.
- Programmable sampling time (channel wise)
- ADC conversion of regular group and injected group.
- External trigger (timer or EXTI) with configurable polarity for both regular and injected groups.
- DMA request generation for transfer of conversions data of regular group.
- Multimode dual mode (available on devices with 2 ADCs or more).
- Configurable DMA data storage in Multimode Dual mode (available on devices with 2 DCs or more).

- Configurable delay between conversions in Dual interleaved mode (available on devices with 2 DCs or more).
- ADC calibration
- ADC channels selectable single/differential input (available only on STM32F30xxC devices)
- ADC Injected sequencer&channels configuration context queue (available only on STM32F30xxC devices)
- ADC offset on injected and regular groups (offset on regular group available only on STM32F30xxC devices)
- ADC supply requirements: 2.4 V to 3.6 V at full speed and down to 1.8 V at slower speed.
- ADC input range: from Vref- (connected to Vssa) to Vref+ (connected to Vdda or to an external voltage reference).

6.2.2 How to use this driver

Configuration of top level parameters related to ADC

1. Enable the ADC interface
 - As prerequisite, ADC clock must be configured at RCC top level.
 - For STM32F30x/STM32F33x devices: Two possible clock sources: synchronous clock derived from AHB clock or asynchronous clock derived from ADC dedicated PLL 72MHz. - Synchronous clock is mandatory since used as ADC core clock. Synchronous clock can be used optionally as ADC conversion clock, depending on ADC init structure clock setting. Synchronous clock is configured using macro `_ADCx_CLK_ENABLE()`. - Asynchronous can be used optionally as ADC conversion clock, depending on ADC init structure clock setting. Asynchronous clock is configured using function `HAL_RCCEEx_PeriphCLKConfig()`.
 - For example, in case of device with a single ADC: Into `HAL_ADC_MspInit()` (recommended code location) or with other device clock parameters configuration:

```
_HAL_RCC_ADC1_CLK_ENABLE() (mandatory)
PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC (optional, if
ADC conversion from asynchronous clock)
PeriphClkInit.Adc1ClockSelection = RCC_ADC1PLLCLK_DIV1 (optional, if
ADC conversion from asynchronous clock)
HAL_RCCEEx_PeriphCLKConfig(&RCC_PeriphClkInitStructure) (optional, if
ADC conversion from asynchronous clock)
```
 - For example, in case of device with 4 ADCs:

```
if((hadc->Instance == ADC1) || (hadc->Instance == ADC2))
{
    _HAL_RCC_ADC1_CLK_ENABLE() (mandatory)
PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC (optional, if
ADC conversion from asynchronous clock)
PeriphClkInit.Adc1ClockSelection = RCC_ADC1PLLCLK_DIV1 (optional,
if ADC conversion from asynchronous clock)
HAL_RCCEEx_PeriphCLKConfig(&RCC_PeriphClkInitStructure) (optional, if
ADC conversion from asynchronous clock)
}
else
{
    _HAL_RCC_ADC34_CLK_ENABLE() (mandatory)
PeriphClkInit.Adc34ClockSelection = RCC_ADC34PLLCLK_DIV1; (optional,
if ADC conversion from asynchronous clock)
```

- ```

 HAL_RCCEx_PeriphCLKConfig(&RCC_PeriphClkInitStructure); (optional, if
 ADC conversion from asynchronous clock)
 }
 - For STM32F37x devices: One clock setting is mandatory: ADC clock (core and
 conversion clock) from APB2 clock.
 - Example: Into HAL_ADC_MspInit() (recommended code location) or with
 other device clock parameters configuration:
 PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC
 PeriphClkInit.AdcClockSelection = RCC_ADCPOLLCLK_DIV2
 HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit)
2. ADC pins configuration
 - Enable the clock for the ADC GPIOs using macro
 __HAL_RCC_GPIOx_CLK_ENABLE()
 - Configure these ADC pins in analog mode using function HAL_GPIO_Init()
3. Optionally, in case of usage of ADC with interruptions:
 - Configure the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
 - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the
 function of corresponding ADC interruption vector ADCx_IRQHandler().
4. Optionally, in case of usage of DMA:
 - Configure the DMA (DMA channel, mode normal or circular, ...) using function
 HAL_DMA_Init().
 - Configure the NVIC for DMA using function
 HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)
 - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the
 function of corresponding DMA interruption vector
 DMAx_Channelx_IRQHandler().

```

### Configuration of ADC, groups regular/injected, channels parameters

- Configure the ADC parameters (resolution, data alignment, ...) and regular group parameters (conversion trigger, sequencer, ...) using function HAL\_ADC\_Init().
- Configure the channels for regular group parameters (channel number, channel rank into sequencer, ..., into regular group) using function HAL\_ADC\_ConfigChannel().
- Optionally, configure the injected group parameters (conversion trigger, sequencer, ..., of injected group) and the channels for injected group parameters (channel number, channel rank into sequencer, ..., into injected group) using function HAL\_ADCEx\_InjectedConfigChannel().
- Optionally, configure the analog watchdog parameters (channels monitored, thresholds, ...) using function HAL\_ADC\_AnalogWDGConfig().
- Optionally, for devices with several ADC instances: configure the multimode parameters using function HAL\_ADCEx\_MultiModeConfigChannel().

### Execution of ADC conversions

- Optionally, perform an automatic ADC calibration to improve the conversion accuracy using function HAL\_ADCEx\_Calibration\_Start().
- ADC driver can be used among three modes: polling, interruption, transfer by DMA.
  - ADC conversion by polling:
    - Activate the ADC peripheral and start conversions using function HAL\_ADC\_Start()
    - Wait for ADC conversion completion using function HAL\_ADC\_PollForConversion() (or for injected group: HAL\_ADCEx\_InjectedPollForConversion() )
    - Retrieve conversion results using function HAL\_ADC\_GetValue() (or for injected group: HAL\_ADCEx\_InjectedGetValue() )

- Stop conversion and disable the ADC peripheral using function `HAL_ADC_Stop()`
- ADC conversion by interruption:
  - Activate the ADC peripheral and start conversions using function `HAL_ADC_Start_IT()`
  - Wait for ADC conversion completion by call of function `HAL_ADC_ConvCpltCallback()` (this function must be implemented in user program) (or for injected group: `HAL_ADCEx_InjectedConvCpltCallback()`)
  - Retrieve conversion results using function `HAL_ADC_GetValue()` (or for injected group: `HAL_ADCEx_InjectedGetValue()`)
  - Stop conversion and disable the ADC peripheral using function `HAL_ADC_Stop_IT()`
- ADC conversion with transfer by DMA:
  - Activate the ADC peripheral and start conversions using function `HAL_ADC_Start_DMA()`
  - Wait for ADC conversion completion by call of function `HAL_ADC_ConvCpltCallback()` or `HAL_ADC_ConvHalfCpltCallback()` (these functions must be implemented in user program)
  - Conversion results are automatically transferred by DMA into destination variable address.
  - Stop conversion and disable the ADC peripheral using function `HAL_ADC_Stop_DMA()`
- For devices with several ADCs: ADC multimode conversion with transfer by DMA:
  - Activate the ADC peripheral (slave) using function `HAL_ADC_Start()` (conversion start pending ADC master)
  - Activate the ADC peripheral (master) and start conversions using function `HAL_ADCEx_MultiModeStart_DMA()`
  - Wait for ADC conversion completion by call of function `HAL_ADC_ConvCpltCallback()` or `HAL_ADC_ConvHalfCpltCallback()` (these functions must be implemented in user program)
  - Conversion results are automatically transferred by DMA into destination variable address.
  - Stop conversion and disable the ADC peripheral (master) using function `HAL_ADCEx_MultiModeStop_DMA()`
  - Stop conversion and disable the ADC peripheral (slave) using function `HAL_ADC_Stop_IT()`

Callback functions must be implemented in user program:

- `HAL_ADC_ErrorCallback()`
- `HAL_ADC_LevelOutOfWindowCallback()` (callback of analog watchdog)
- `HAL_ADC_ConvCpltCallback()`
- `HAL_ADC_ConvHalfCpltCallback()`
- `HAL_ADCEx_InjectedConvCpltCallback()`
- `HAL_ADCEx_InjectedQueueOverflowCallback()` (for STM32F30x/STM32F33x devices)

## Deinitialization of ADC

1. Disable the ADC interface
  - ADC clock can be hard reset and disabled at RCC top level.
  - Hard reset of ADC peripherals using macro `_ADCx_FORCE_RESET()`, `_ADCx_RELEASE_RESET()`.
  - ADC clock disable using the equivalent macro/functions as configuration step.
  - For STM32F30x/STM32F33x devices: Caution: For devices with several ADCs: These settings impact both ADC of common group: ADC1&ADC2, ADC3&ADC4 if available (ADC2, ADC3, ADC4 availability depends on STM32 product)
    - For example, in case of device with a single ADC: Into `HAL_ADC_MspDeInit()` (recommended code location) or with other device clock parameters configuration:
      - `_HAL_RCC_ADC1_FORCE_RESET()` (optional)
      - `_HAL_RCC_ADC1_RELEASE_RESET()` (optional)
      - `_HAL_RCC_ADC1_CLK_DISABLE()` (mandatory)
    - PeriphClkInit.PeriphClockSelection = `RCC_PERIPHCLK_ADC` (optional, if configured before)
    - PeriphClkInit.Adc1ClockSelection = `RCC_ADC1PLLCLK_OFF` (optional, if configured before)
    - `HAL_RCCEEx_PeriphCLKConfig(&RCC_PeriphClkInitStructure)` (optional, if configured before)
  - For example, in case of device with 4 ADCs:
 

```
if((hadc->Instance == ADC1) || (hadc->Instance == ADC2))
{
 _HAL_RCC_ADC12_FORCE_RESET() (optional)
 _HAL_RCC_ADC12_RELEASE_RESET() (optional)
 _HAL_RCC_ADC12_CLK_DISABLE() (mandatory)
}
else
{
 _HAL_RCC_ADC32_FORCE_RESET() (optional)
 _HAL_RCC_ADC32_RELEASE_RESET() (optional)
 _HAL_RCC_ADC34_CLK_DISABLE() (mandatory)
}
```

    - PeriphClkInit.PeriphClockSelection = `RCC_PERIPHCLK_ADC` (optional, if configured before)
    - PeriphClkInit.Adc12ClockSelection = `RCC_ADC12PLLCLK_OFF` (optional, if configured before)
    - `HAL_RCCEEx_PeriphCLKConfig(&RCC_PeriphClkInitStructure)` (optional, if configured before)
  - For STM32F37x devices:
    - Example: Into `HAL_ADC_MspDeInit()` (recommended code location) or with other device clock parameters configuration:
 

```
PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC
PeriphClkInit.AdcClockSelection = RCC_ADCPLLCLK_OFF
HAL_RCCEEx_PeriphCLKConfig(&PeriphClkInit)
```
2. ADC pins configuration
  - Disable the clock for the ADC GPIOs using macro `_HAL_RCC_GPIOx_CLK_DISABLE()`

3. Optionally, in case of usage of ADC with interruptions:
  - Disable the NVIC for ADC using function HAL\_NVIC\_EnableIRQ(ADCx\_IRQHandler)
4. Optionally, in case of usage of DMA:
  - Deinitialize the DMA using function HAL\_DMA\_Init().
  - Disable the NVIC for DMA using function HAL\_NVIC\_DisableIRQ(DMAx\_Channelx\_IRQHandler)

### 6.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the ADC.
- De-initialize the ADC.

This section contains the following APIs:

- [\*HAL\\_ADC\\_Init\(\)\*](#)
- [\*HAL\\_ADC\\_DeInit\(\)\*](#)
- [\*HAL\\_ADC\\_MspInit\(\)\*](#)
- [\*HAL\\_ADC\\_MspDeInit\(\)\*](#)

### 6.2.4 IO operation functions

This section provides functions allowing to:

- Start conversion of regular group.
- Stop conversion of regular group.
- Poll for conversion complete on regular group.
- Poll for conversion event.
- Get result of regular channel conversion.
- Start conversion of regular group and enable interruptions.
- Stop conversion of regular group and disable interruptions.
- Handle ADC interrupt request
- Start conversion of regular group and enable DMA transfer.
- Stop conversion of regular group and disable ADC DMA transfer.

This section contains the following APIs:

- [\*HAL\\_ADC\\_Start\(\)\*](#)
- [\*HAL\\_ADC\\_Stop\(\)\*](#)
- [\*HAL\\_ADC\\_PollForConversion\(\)\*](#)
- [\*HAL\\_ADC\\_PollForEvent\(\)\*](#)
- [\*HAL\\_ADC\\_Start\\_IT\(\)\*](#)
- [\*HAL\\_ADC\\_Stop\\_IT\(\)\*](#)
- [\*HAL\\_ADC\\_Start\\_DMA\(\)\*](#)
- [\*HAL\\_ADC\\_Stop\\_DMA\(\)\*](#)
- [\*HAL\\_ADC\\_GetValue\(\)\*](#)
- [\*HAL\\_ADC\\_IRQHandler\(\)\*](#)
- [\*HAL\\_ADC\\_ConvCpltCallback\(\)\*](#)
- [\*HAL\\_ADC\\_ConvHalfCpltCallback\(\)\*](#)
- [\*HAL\\_ADC\\_LevelOutOfWindowCallback\(\)\*](#)
- [\*HAL\\_ADC\\_ErrorCallback\(\)\*](#)

## 6.2.5 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on regular group
- Configure the analog watchdog

This section contains the following APIs:

- [\*HAL\\_ADC\\_ConfigChannel\(\)\*](#)
- [\*HAL\\_ADC\\_AnalogWDGConfig\(\)\*](#)

## 6.2.6 Peripheral state and errors functions

This subsection provides functions to get in run-time the status of the peripheral.

- Check the ADC state
- Check the ADC error code

This section contains the following APIs:

- [\*HAL\\_ADC\\_GetState\(\)\*](#)
- [\*HAL\\_ADC\\_GetError\(\)\*](#)

## 6.2.7 Detailed description of functions

### **HAL\_ADC\_Init**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Notes                | <ul style="list-style-type: none"> <li>• As prerequisite, ADC clock must be configured at RCC top level depending on both possible clock sources: PLL clock or AHB clock. See commented example code below that can be copied and uncommented into HAL_ADC_MspInit().</li> <li>• Possibility to update parameters on the fly: This function initializes the ADC MSP (HAL_ADC_MspInit()) only when coming from ADC state reset. Following calls to this function can be used to reconfigure some parameters of ADC_InitTypeDef structure on the fly, without modifying MSP configuration. If ADC MSP has to be modified again, HAL_ADC_DeInit() must be called before HAL_ADC_Init(). The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_InitTypeDef".</li> <li>• This function configures the ADC within 2 scopes: scope of entire ADC and scope of regular group. For parameters details, see comments of structure "ADC_InitTypeDef".</li> <li>• For devices with several ADCs: parameters related to common ADC registers (ADC clock mode) are set only if all ADCs sharing the same common group are disabled. If this is not the case, these common parameters setting are bypassed</li> </ul> |

without error reporting: it can be the intended behaviour in case of update of a parameter of ADC\_InitTypeDef on the fly, without disabling the other ADCs sharing the same common group.

### **HAL\_ADC\_DeInit**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameters    | <ul style="list-style-type: none"> <li>• <b>hadc:</b> ADC handle</li> </ul>                                                                                                                                                                                                                                                                                                                                                   |
| Return values | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status.</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| Notes         | <ul style="list-style-type: none"> <li>• : ADC peripheral disable is forcing stop of potential conversion on injected group. If injected group is under use, it should be preliminarily stopped using HAL_ADCEx_InjectedStop function.</li> <li>• : Case of multimode enabled (for devices with several ADCs): This function is for single-ADC mode only. For multimode, use the dedicated MultimodeStop function.</li> </ul> |

### **HAL\_ADC\_GetValue**

- |                      |                                                                                                                                                                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>uint32_t HAL_ADC_GetValue (ADC_HandleTypeDef * hadc)</b>                                                                                                                                                                                                                 |
| Function description | Get ADC regular group conversion result.                                                                                                                                                                                                                                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hadc:</b> ADC handle</li> </ul>                                                                                                                                                                                                 |
| Return values        | <ul style="list-style-type: none"> <li>• <b>Converted:</b> value</li> </ul>                                                                                                                                                                                                 |
| Notes                | <ul style="list-style-type: none"> <li>• Reading DR register automatically clears EOC (end of conversion of regular group) flag. Additionally, this functions clears EOS (end of sequence of regular group) flag, in case of the end of the sequence is reached.</li> </ul> |

### **HAL\_ADC\_IRQHandler**

- |                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_ADC_IRQHandler (ADC_HandleTypeDef * hadc)</b>                   |
| Function description | Handles ADC interrupt request.                                              |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hadc:</b> ADC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

### **HAL\_ADC\_ConvCpltCallback**

- |                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_ADC_ConvCpltCallback (ADC_HandleTypeDef * hadc)</b>             |
| Function description | Conversion complete callback in non blocking mode.                          |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hadc:</b> ADC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

### **HAL\_ADC\_ConvHalfCpltCallback**

- |                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_ADC_ConvHalfCpltCallback (ADC_HandleTypeDef * hadc)</b>         |
| Function description | Conversion DMA half-transfer callback in non blocking mode.                 |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hadc:</b> ADC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_ADC\_LevelOutOfWindowCallback**

Function name      **void HAL\_ADC\_LevelOutOfWindowCallback  
(ADC\_HandleTypeDef \* hadc)**

Function description      Analog watchdog callback in non blocking mode.

Parameters      • **hadc:** ADC handle

Return values      • **None**

**HAL\_ADC\_ErrorCallback**

Function name      **void HAL\_ADC\_ErrorCallback (ADC\_HandleTypeDef \* hadc)**

Function description      ADC error callback in non blocking mode (ADC conversion with interruption or transfer by DMA)

Parameters      • **hadc:** ADC handle

Return values      • **None**

**HAL\_ADC\_ConfigChannel**

Function name      **HAL\_StatusTypeDef HAL\_ADC\_ConfigChannel  
(ADC\_HandleTypeDef \* hadc, ADC\_ChannelConfTypeDef \*  
sConfig)**

Function description      Configures the the selected channel to be linked to the regular group.

Parameters      • **hadc:** ADC handle  
• **sConfig:** Structure of ADC channel for regular group.

Return values      • **HAL:** status

Notes      • In case of usage of internal measurement channels:  
Vbat/VrefInt/TempSensor. The recommended sampling time  
is at least: For devices STM32F37x: 17.1us for temperature  
sensorFor the other STM32F3 devices: 2.2us for each of  
channels Vbat/VrefInt/TempSensor. These internal paths can  
be disabled using function HAL\_ADC\_DelInit().  
• Possibility to update parameters on the fly: This function  
initializes channel into regular group, following calls to this  
function can be used to reconfigure some parameters of  
structure "ADC\_ChannelConfTypeDef" on the fly, without  
reseting the ADC. The setting of these parameters is  
conditioned to ADC state. For parameters constraints, see  
comments of structure "ADC\_ChannelConfTypeDef".

**HAL\_ADC\_AnalogWDGConfig**

Function name      **HAL\_StatusTypeDef HAL\_ADC\_AnalogWDGConfig  
(ADC\_HandleTypeDef \* hadc, ADC\_AnalogWDGConfTypeDef \*  
AnalogWDGConfig)**

Function description      Configures the analog watchdog.

Parameters      • **hadc:** ADC handle  
• **AnalogWDGConfig:** Structure of ADC analog watchdog

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Return values | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |
| Notes         | <ul style="list-style-type: none"> <li>• Possibility to update parameters on the fly: This function initializes the selected analog watchdog, following calls to this function can be used to reconfigure some parameters of structure "ADC_AnalogWDGConfTypeDef" on the fly, without resetting the ADC. ##### Field Documentation

- ***uint32\_t ADC\_InitTypeDef::ClockPrescaler***  
Select ADC clock source (synchronous clock derived from AHB clock or asynchronous clock derived from ADC dedicated PLL 72MHz) and clock prescaler. The clock is common for all the ADCs. This parameter can be a value of [\*\*ADCEx\\_ClockPrescaler\*\*](#)  
Note: In case of usage of channels on injected group, ADC frequency should be lower than AHB clock frequency /4 for resolution 12 or 10 bits, AHB clock frequency /3 for resolution 8 bits, AHB clock frequency /2 for resolution 6 bits. Note: In case of usage of the ADC dedicated PLL clock, this clock must be preliminarily enabled and prescaler set at RCC top level. Note: This parameter can be modified only if all ADCs of the common ADC group are disabled (for products with several ADCs)
- ***uint32\_t ADC\_InitTypeDef::Resolution***  
Configures the ADC resolution. This parameter can be a value of [\*\*ADCEx\\_Resolution\*\*](#)
- ***uint32\_t ADC\_InitTypeDef::DataAlign***  
Specifies ADC data alignment to right (for resolution 12 bits: MSB on register bit 11 and LSB on register bit 0U) (default setting) or to left (for resolution 12 bits, if offset disabled: MSB on register bit 15 and LSB on register bit 4U, if offset enabled: MSB on register bit 14 and LSB on register bit 3U). See reference manual for alignments with other resolutions. This parameter can be a value of [\*\*ADCEx\\_Data\\_align\*\*](#)
- ***uint32\_t ADC\_InitTypeDef::ScanConvMode***  
Configures the sequencer of regular and injected groups. This parameter can be associated to parameter 'DiscontinuousConvMode' to have main sequence subdivided in successive parts. If disabled: Conversion is performed in single mode (one channel converted, the one defined in rank 1U). Parameters 'NbrOfConversion' and 'InjectedNbrOfConversion' are discarded (equivalent to set to 1U). If enabled: Conversions are performed in sequence mode (multiple ranks defined by 'NbrOfConversion'/'InjectedNbrOfConversion' and each channel rank). Scan direction is upward: from rank1 to rank 'n'. This parameter can be a value of [\*\*ADCEx\\_Scan\\_mode\*\*](#)

- ***uint32\_t ADC\_InitTypeDef::EOCSelection***  
Specifies what EOC (End Of Conversion) flag is used for conversion by polling and interruption: end of conversion of each rank or complete sequence. This parameter can be a value of [\*\*ADCEx\\_EOCSelection\*\*](#).
- ***uint32\_t ADC\_InitTypeDef::LowPowerAutoWait***  
Selects the dynamic low power Auto Delay: ADC conversions are performed only when necessary. New conversion starts only when the previous conversion (for regular group) or previous sequence (for injected group) has been treated by user software. This feature automatically adapts the speed of ADC to the speed of the system that reads the data. Moreover, this avoids risk of overrun for low frequency applications. This parameter can be set to ENABLE or DISABLE. Note: Do not use with interruption or DMA (**HAL\_ADC\_Start\_IT()**, **HAL\_ADC\_Start\_DMA()**) since they have to clear immediately the EOC flag to free the IRQ vector sequencer. Do use with polling: 1. Start conversion with **HAL\_ADC\_Start()**, 2. Later on, when conversion data is needed: use **HAL\_ADC\_PollForConversion()** to ensure that conversion is completed and use **HAL\_ADC\_GetValue()** to retrieve conversion result and trig another conversion (in case of usage of injected group, use the equivalent functions **HAL\_ADCExInjected\_Start()**, **HAL\_ADCEx\_InjectedGetValue()**, ...).
- ***uint32\_t ADC\_InitTypeDef::ContinuousConvMode***  
Specifies whether the conversion is performed in single mode (one conversion) or continuous mode for regular group, after the selected trigger occurred (software start or external trigger). This parameter can be set to ENABLE or DISABLE.
- ***uint32\_t ADC\_InitTypeDef::NbrOfConversion***  
Specifies the number of ranks that will be converted within the regular group sequencer. To use the regular group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min\_Data = 1 and Max\_Data = 16. Note: This parameter must be modified when no conversion is on going on regular group (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32\_t ADC\_InitTypeDef::DiscontinuousConvMode***  
Specifies whether the conversions sequence of regular group is performed in Complete-sequence/Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. If continuous mode is enabled, this parameter setting is discarded. This parameter can be set to ENABLE or DISABLE.
- ***uint32\_t ADC\_InitTypeDef::NbrOfDiscConversion***  
Specifies the number of discontinuous conversions in which the main sequence of regular group (parameter NbrOfConversion) will be subdivided. If parameter 'DiscontinuousConvMode' is disabled, this parameter is discarded. This parameter must be a number between Min\_Data = 1 and Max\_Data = 8.
- ***uint32\_t ADC\_InitTypeDef::ExternalTrigConv***  
Selects the external event used to trigger the conversion start of regular group. If set to ADC\_SOFTWARE\_START, external triggers are disabled. This parameter can be a value of [\*\*ADCEx\\_External\\_trigger\\_source-Regular\*\*](#) Caution: For devices with several ADCs, external trigger source is common to ADC common group (for example: ADC1&ADC2, ADC3&ADC4, if available)
- ***uint32\_t ADC\_InitTypeDef::ExternalTrigConvEdge***  
Selects the external trigger edge of regular group. If trigger is set to ADC\_SOFTWARE\_START, this parameter is discarded. This parameter can be a value of [\*\*ADCEx\\_External\\_trigger\\_edge-Regular\*\*](#)
- ***uint32\_t ADC\_InitTypeDef::DMAContinuousRequests***  
Specifies whether the DMA requests are performed in one shot mode (DMA transfer stop when number of conversions is reached) or in Continuous mode (DMA transfer

- unlimited, whatever number of conversions). Note: In continuous mode, DMA must be configured in circular mode. Otherwise an overrun will be triggered when DMA buffer maximum pointer is reached. This parameter can be set to ENABLE or DISABLE.  
 Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32\_t ADC\_InitTypeDef::Overrun***  
 Select the behaviour in case of overrun: data overwritten (default) or preserved. This parameter is for regular group only. This parameter can be a value of ***ADCEx\_Overrun*** Note: Case of overrun set to data preserved and usage with end on conversion interruption (HAL\_Start\_IT()): ADC IRQ handler has to clear end of conversion flags, this induces the release of the preserved data. If needed, this data can be saved into function **HAL\_ADC\_ConvCpltCallback()** (called before end of conversion flags clear). Note: Error reporting in function of conversion mode:Usage with ADC conversion by polling for event or interruption: Error is reported only if overrun is set to data preserved. If overrun is set to data overwritten, user can willingly not read the conversion data each time, this is not considered as an erroneous case.Usage with ADC conversion by DMA: Error is reported whatever overrun setting (DMA is expected to process all data from data register, any data missed would be abnormal).

## 7.1.2 ADC\_ChannelConfTypeDef

### Data Fields

- ***uint32\_t Channel***
- ***uint32\_t Rank***
- ***uint32\_t SamplingTime***
- ***uint32\_t SingleDiff***
- ***uint32\_t OffsetNumber***
- ***uint32\_t Offset***

### Field Documentation

- ***uint32\_t ADC\_ChannelConfTypeDef::Channel***  
 Specifies the channel to configure into ADC regular group. This parameter can be a value of ***ADCEx\_channels*** Note: Depending on devices, some channels may not be available on package pins. Refer to device datasheet for channels availability.
- ***uint32\_t ADC\_ChannelConfTypeDef::Rank***  
 Specifies the rank in the regular group sequencer. This parameter can be a value of ***ADCEx\_regular\_rank*** Note: In case of need to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions can be adjusted)
- ***uint32\_t ADC\_ChannelConfTypeDef::SamplingTime***  
 Sampling time value to be set for the selected channel. Unit: ADC clock cycles  
 Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADCEx\_sampling\_times*** Caution: This parameter updates the parameter property of the channel, that can be used into regular and/or injected groups. If this same channel has been previously configured in the other group (regular/injected), it will be updated to last setting. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting) Refer to device datasheet for timings values, parameters TS\_vrefint, TS\_vbat, TS\_temp (values rough order: 2.2us min).
- ***uint32\_t ADC\_ChannelConfTypeDef::SingleDiff***  
 Selection of single-ended or differential input. In differential mode: Differential

measurement is between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically. This parameter must be a value of ***ADCEx\_SingleDifferential*** Caution: This parameter updates the parameter property of the channel, that can be used into regular and/or injected groups. If this same channel has been previously configured in the other group (regular/injected), it will be updated to last setting. Note: Channels 1 to 14 are available in differential mode. Channels 15U, 16U, 17U, 18 can be used only in single-ended mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behaviour in case of another parameter update on the fly)

- ***uint32\_t ADC\_ChannelConfTypeDef::OffsetNumber***  
Selects the offset number This parameter can be a value of ***ADCEx\_OffsetNumber*** Caution: Only one channel is allowed per channel. If another channel was on this offset number, the offset will be changed to the new channel
- ***uint32\_t ADC\_ChannelConfTypeDef::Offset***  
Defines the offset to be subtracted from the raw converted data when convert channels. Offset value must be a positive number. Depending of ADC resolution selected (12U, 10U, 8 or 6 bits), this parameter must be a number between Min\_Data = 0x000 and Max\_Data = 0xFFFFU, 0x3FFU, 0xFF or 0x3F respectively. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).

### 7.1.3 ADC\_InjectionConfTypeDef

#### Data Fields

- ***uint32\_t InjectedChannel***
- ***uint32\_t InjectedRank***
- ***uint32\_t InjectedSamplingTime***
- ***uint32\_t InjectedSingleDiff***
- ***uint32\_t InjectedOffsetNumber***
- ***uint32\_t InjectedOffset***
- ***uint32\_t InjectedNbrOfConversion***
- ***uint32\_t InjectedDiscontinuousConvMode***
- ***uint32\_t AutoInjectedConv***
- ***uint32\_t QueueInjectedContext***
- ***uint32\_t ExternalTrigInjecConv***
- ***uint32\_t ExternalTrigInjecConvEdge***

#### Field Documentation

- ***uint32\_t ADC\_InjectionConfTypeDef::InjectedChannel***  
Configure the ADC injected channel This parameter can be a value of ***ADCEx\_channels*** Note: Depending on devices, some channels may not be available on package pins. Refer to device datasheet for channels availability.
- ***uint32\_t ADC\_InjectionConfTypeDef::InjectedRank***  
The rank in the regular group sequencer This parameter must be a value of ***ADCEx\_injected\_rank*** Note: In case of need to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions can be adjusted)
- ***uint32\_t ADC\_InjectionConfTypeDef::InjectedSamplingTime***  
Sampling time value to be set for the selected channel. Unit: ADC clock cycles  
Conversion time is the addition of sampling time and processing time (12.5 ADC clock

- cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADCEx\_sampling\_times*** Caution: This parameter updates the parameter property of the channel, that can be used into regular and/or injected groups. If this same channel has been previously configured in the other group (regular/injected), it will be updated to last setting. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting) Refer to device datasheet for timings values, parameters TS\_vrefint, TS\_vbat, TS\_temp (values rough order: 2.2us min).
- ***uint32\_t ADC\_InjectionConfTypeDef::InjectedSingleDiff***  
Selection of single-ended or differential input. In differential mode: Differential measurement is between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically. This parameter must be a value of ***ADCEx\_SingleDifferential*** Caution: This parameter updates the parameter property of the channel, that can be used into regular and/or injected groups. If this same channel has been previously configured in the other group (regular/injected), it will be updated to last setting. Note: Channels 1 to 14 are available in differential mode. Channels 15U, 16U, 17U, 18 can be used only in single-ended mode. Note: When configuring a channel 'i' in differential mode, the channel 'i-1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behaviour in case of another parameter update on the fly)
  - ***uint32\_t ADC\_InjectionConfTypeDef::InjectedOffsetNumber***  
Selects the offset number This parameter can be a value of ***ADCEx\_OffsetNumber*** Caution: Only one channel is allowed per offset number. If another channel was on this offset number, the offset will be changed to the new channel.
  - ***uint32\_t ADC\_InjectionConfTypeDef::InjectedOffset***  
Defines the offset to be subtracted from the raw converted data. Offset value must be a positive number. Depending of ADC resolution selected (12U, 10U, 8 or 6 bits), this parameter must be a number between Min\_Data = 0x000 and Max\_Data = 0xFFFFU, 0x3FFU, 0xFF or 0x3F respectively.
  - ***uint32\_t ADC\_InjectionConfTypeDef::InjectedNbrOfConversion***  
Specifies the number of ranks that will be converted within the injected group sequencer. To use the injected group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min\_Data = 1 and Max\_Data = 4. Caution: this setting impacts the entire injected group. Therefore, call of **HAL\_ADCEx\_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
  - ***uint32\_t ADC\_InjectionConfTypeDef::InjectedDiscontinuousConvMode***  
Specifies whether the conversions sequence of injected group is performed in Complete-sequence/Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. If continuous mode is enabled, this parameter setting is discarded. This parameter can be set to ENABLE or DISABLE. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). Note: For injected group, number of discontinuous ranks increment is fixed to one-by-one. Caution: this setting impacts the entire injected group. Therefore, call of **HAL\_ADCEx\_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
  - ***uint32\_t ADC\_InjectionConfTypeDef::AutoInjectedConv***  
Enables or disables the selected ADC automatic injected group conversion after

regular one This parameter can be set to ENABLE or DISABLE. Note: To use Automatic injected conversion, discontinuous mode must be disabled ('DiscontinuousConvMode' and 'InjectedDiscontinuousConvMode' set to DISABLE) Note: To use Automatic injected conversion, injected group external triggers must be disabled ('ExternalTrigInjecConv' set to ADC\_SOFTWARE\_START) Note: In case of DMA used with regular group: if DMA configured in normal mode (single shot) JAUTO will be stopped upon DMA transfer complete. To maintain JAUTO always enabled, DMA must be configured in circular mode. Caution: this setting impacts the entire injected group. Therefore, call of **HAL\_ADCEx\_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

- ***uint32\_t ADC\_InjectionTypeDef::QueueInjectedContext***

Specifies whether the context queue feature is enabled. This parameter can be set to ENABLE or DISABLE. If context queue is enabled, injected sequencer&channels configurations are queued on up to 2 contexts. If a new injected context is set when queue is full, error is triggered by interruption and through function 'HAL\_ADCEx\_InjectedQueueOverflowCallback'. Caution: This feature request that the sequence is fully configured before injected conversion start. Therefore, configure channels with **HAL\_ADCEx\_InjectedConfigChannel()** as many times as value of 'InjectedNbrOfConversion' parameter. Caution: this setting impacts the entire injected group. Therefore, call of **HAL\_ADCEx\_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion).

- ***uint32\_t ADC\_InjectionTypeDef::ExternalTrigInjecConv***

Selects the external event used to trigger the conversion start of injected group. If set to ADC\_INJECTED\_SOFTWARE\_START, external triggers are disabled. This parameter can be a value of **ADCEx\_External\_trigger\_source\_Injected** Caution: this setting impacts the entire injected group. Therefore, call of **HAL\_ADCEx\_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

- ***uint32\_t ADC\_InjectionTypeDef::ExternalTrigInjecConvEdge***

Selects the external trigger edge of injected group. This parameter can be a value of **ADCEx\_External\_trigger\_edge\_Injected**. If trigger is set to ADC\_INJECTED\_SOFTWARE\_START, this parameter is discarded. Caution: this setting impacts the entire injected group. Therefore, call of **HAL\_ADCEx\_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

## 7.1.4 ADC\_InjectionConfigTypeDef

### Data Fields

- ***uint32\_t ContextQueue***
- ***uint32\_t ChannelCount***

### Field Documentation

- ***uint32\_t ADC\_InjectionConfigTypeDef::ContextQueue***

Injected channel configuration context: build-up over each **HAL\_ADCEx\_InjectedConfigChannel()** call to finally initialize JSQR register at **HAL\_ADCEx\_InjectedConfigChannel()** last call

- ***uint32\_t ADC\_InjectionConfigTypeDef::ChannelCount***

Number of channels in the injected sequence

## 7.1.5 ADC\_AnalogWDGConfTypeDef

### Data Fields

- *uint32\_t WatchdogNumber*
- *uint32\_t WatchdogMode*
- *uint32\_t Channel*
- *uint32\_t ITMode*
- *uint32\_t HighThreshold*
- *uint32\_t LowThreshold*

### Field Documentation

- ***uint32\_t ADC\_AnalogWDGConfTypeDef::WatchdogNumber***  
Selects which ADC analog watchdog to apply to the selected channel. For Analog Watchdog 1: Only 1 channel can be monitored (or overall group of channels by setting parameter 'WatchdogMode') For Analog Watchdog 2 and 3: Several channels can be monitored (by successive calls of 'HAL\_ADC\_AnalogWDGConfig()' for each channel) This parameter can be a value of [\*ADCEx\\_analog\\_watchdog\\_number\*](#).
- ***uint32\_t ADC\_AnalogWDGConfTypeDef::WatchdogMode***  
For Analog Watchdog 1: Configures the ADC analog watchdog mode: single channel/overall group of channels, regular/injected group. For Analog Watchdog 2 and 3: There is no configuration for overall group of channels as AWD1. Set value 'ADC\_ANALOGWATCHDOG\_NONE' to reset channels group programmed with parameter 'Channel', set any other value to not use this parameter. This parameter can be a value of [\*ADCEx\\_analog\\_watchdog\\_mode\*](#).
- ***uint32\_t ADC\_AnalogWDGConfTypeDef::Channel***  
Selects which ADC channel to monitor by analog watchdog. For Analog Watchdog 1: this parameter has an effect only if parameter 'WatchdogMode' is configured on single channel. Only 1 channel can be monitored. For Analog Watchdog 2 and 3: Several channels can be monitored (successive calls of **HAL\_ADC\_AnalogWDGConfig()** must be done, one for each channel). Channels group reset can be done by setting WatchdogMode to 'ADC\_ANALOGWATCHDOG\_NONE'). This parameter can be a value of [\*ADCEx\\_channels\*](#).
- ***uint32\_t ADC\_AnalogWDGConfTypeDef::ITMode***  
Specifies whether the analog watchdog is configured in interrupt or polling mode. This parameter can be set to ENABLE or DISABLE
- ***uint32\_t ADC\_AnalogWDGConfTypeDef::HighThreshold***  
Configures the ADC analog watchdog High threshold value. Depending of ADC resolution selected (12U, 10U, 8 or 6 bits), this parameter must be a number between Min\_Data = 0x000 and Max\_Data = 0xFFFFU, 0x3FFU, 0xFF or 0x3F respectively.  
Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored.
- ***uint32\_t ADC\_AnalogWDGConfTypeDef::LowThreshold***  
Configures the ADC analog watchdog Low threshold value. Depending of ADC resolution selected (12U, 10U, 8 or 6 bits), this parameter must be a number between Min\_Data = 0x000 and Max\_Data = 0xFFFFU, 0x3FFU, 0xFF or 0x3F respectively.  
Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored.

## 7.1.6 ADC\_MultiModeTypeDef

### Data Fields

- *uint32\_t Mode*
- *uint32\_t DMAAccessMode*
- *uint32\_t TwoSamplingDelay*

### Field Documentation

- ***uint32\_t ADC\_MultiModeTypeDef::Mode***  
Configures the ADC to operate in independent or multi mode. This parameter can be a value of [\*\*ADCEx\\_Common\\_mode\*\*](#)
- ***uint32\_t ADC\_MultiModeTypeDef::DMAAccessMode***  
Configures the DMA mode for multi ADC mode: selection whether 2 DMA channels (each ADC use its own DMA channel) or 1 DMA channel (one DMA channel for both ADC, DMA of ADC master) This parameter can be a value of [\*\*ADCEx\\_Direct\\_memory\\_access\\_mode\\_for\\_multimode\*\*](#) Caution: Limitations with multimode DMA access enabled (1 DMA channel used): In case of dual mode in high speed (more than 5Msps) or high activity of DMA by other peripherals, there is a risk of DMA overrun. Therefore, it is recommended to disable multimode DMA access: each ADC uses its own DMA channel. Refer to device errata sheet for more details.
- ***uint32\_t ADC\_MultiModeTypeDef::TwoSamplingDelay***  
Configures the Delay between 2 sampling phases. This parameter can be a value of [\*\*ADCEx\\_delay\\_between\\_2\\_sampling\\_phases\*\*](#) Delay range depends on selected resolution: from 1 to 12 clock cycles for 12 bits, from 1 to 10 clock cycles for 10 bits from 1 to 8 clock cycles for 8 bits, from 1 to 6 clock cycles for 6 bits

## 7.2 ADCEx Firmware driver API description

### 7.2.1 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the ADC.
- De-initialize the ADC.

This section contains the following APIs:

- [\*\*HAL\\_ADC\\_Init\(\)\*\*](#)
- [\*\*HAL\\_ADC\\_DeInit\(\)\*\*](#)

### 7.2.2 IO operation functions

This section provides functions allowing to:

- Start conversion of regular group.
- Stop conversion of regular group.
- Poll for conversion complete on regular group.
- Poll for conversion event.
- Get result of regular channel conversion.
- Start conversion of regular group and enable interruptions.
- Stop conversion of regular group and disable interruptions.
- Handle ADC interrupt request
- Start conversion of regular group and enable DMA transfer.
- Stop conversion of regular group and disable ADC DMA transfer.
- Start conversion of injected group.
- Stop conversion of injected group.
- Poll for conversion complete on injected group.
- Get result of injected channel conversion.
- Start conversion of injected group and enable interruptions.
- Stop conversion of injected group and disable interruptions.
- Start multimode and enable DMA transfer.
- Stop multimode and disable ADC DMA transfer.
- Get result of multimode conversion.

- Perform the ADC self-calibration for single or differential ending.
- Get calibration factors for single or differential ending.
- Set calibration factors for single or differential ending.

This section contains the following APIs:

- *HAL\_ADC\_Start()*
- *HAL\_ADC\_Stop()*
- *HAL\_ADC\_PollForConversion()*
- *HAL\_ADC\_PollForEvent()*
- *HAL\_ADC\_Start\_IT()*
- *HAL\_ADC\_Stop\_IT()*
- *HAL\_ADC\_Start\_DMA()*
- *HAL\_ADC\_Stop\_DMA()*
- *HAL\_ADC\_GetValue()*
- *HAL\_ADC\_IRQHandler()*
- *HAL\_ADCEx\_Calibration\_Start()*
- *HAL\_ADCEx\_Calibration\_GetValue()*
- *HAL\_ADCEx\_Calibration\_SetValue()*
- *HAL\_ADCEx\_InjectedStart()*
- *HAL\_ADCEx\_InjectedStop()*
- *HAL\_ADCEx\_InjectedPollForConversion()*
- *HAL\_ADCEx\_InjectedStart\_IT()*
- *HAL\_ADCEx\_InjectedStop\_IT()*
- *HAL\_ADCEx\_MultiModeStart\_DMA()*
- *HAL\_ADCEx\_MultiModeStop\_DMA()*
- *HAL\_ADCEx\_MultiModeGetValue()*
- *HAL\_ADCEx\_InjectedGetValue()*
- *HAL\_ADCEx-RegularStop()*
- *HAL\_ADCEx-RegularStop\_IT()*
- *HAL\_ADCEx-RegularStop\_DMA()*
- *HAL\_ADCEx-RegularMultiModeStop\_DMA()*
- *HAL\_ADCEx\_InjectedConvCpltCallback()*
- *HAL\_ADCEx\_InjectedQueueOverflowCallback()*
- *HAL\_ADCEx\_LevelOutOfWindow2Callback()*
- *HAL\_ADCEx\_LevelOutOfWindow3Callback()*

### 7.2.3 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on regular group
- Configure channels on injected group
- Configure multimode
- Configure the analog watchdog

This section contains the following APIs:

- *HAL\_ADC\_ConfigChannel()*
- *HAL\_ADCEx\_InjectedConfigChannel()*
- *HAL\_ADC\_AnalogWDGConfig()*
- *HAL\_ADCEx\_MultiModeConfigChannel()*

## 7.2.4 Detailed description of functions

### HAL\_ADCEx\_Calibration\_Start

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Return values | <ul style="list-style-type: none"> <li>• <b>ADC:</b> group injected conversion data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Notes         | <ul style="list-style-type: none"> <li>• Reading register JDRx automatically clears ADC flag JEOC (ADC group injected end of unitary conversion).</li> <li>• This function does not clear ADC flag JEOS (ADC group injected end of sequence conversion) Occurrence of flag JEOS rising: If sequencer is composed of 1 rank, flag JEOS is equivalent to flag JEOC. If sequencer is composed of several ranks, during the scan sequence flag JEOC only is raised, at the end of the scan sequence both flags JEOC and EOS are raised. Flag JEOS must not be cleared by this function because it would not be compliant with low power features (feature low power auto-wait, not available on all STM32 families). To clear this flag, either use function: in programming model IT: HAL_ADC_IRQHandler(), in programming model polling:<br/>HAL_ADCEx_InjectedPollForConversion() or<br/>__HAL_ADC_CLEAR_FLAG(&amp;hadc, ADC_FLAG_JEOS).</li> </ul> |

| Function name        | <b>void HAL_ADCEx_InjectedQueueOverflowCallback<br/>(ADC_HandleTypeDef * hadc)</b>                                                                                                                                                                                  |
| Function description | Injected context queue overflow flag callback.                                                                                                                                                                                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hadc:</b> ADC handle</li> </ul>                                                                                                                                                                                         |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                                                                                                     |
| Notes                | <ul style="list-style-type: none"> <li>• This callback is called if injected context queue is enabled (parameter "QueueInjectedContext" in injected channel configuration) and if a new injected context is set when queue is full (maximum 2 contexts).</li> </ul> |

### **HAL\_ADCEx\_LevelOutOfWindow2Callback**

|                      |                                                                                |
|----------------------|--------------------------------------------------------------------------------|
| Function name        | <b>void HAL_ADCEx_LevelOutOfWindow2Callback<br/>(ADC_HandleTypeDef * hadc)</b> |
| Function description | Analog watchdog 2 callback in non blocking mode.                               |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hadc:</b> ADC handle</li> </ul>    |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                |

**HAL\_ADCEx\_LevelOutOfWindow3Callback**

Function name      **void HAL\_ADCEx\_LevelOutOfWindow3Callback  
(ADC\_HandleTypeDef \* hadc)**

Function description      Analog watchdog 3 callback in non blocking mode.

Parameters      • **hadc:** ADC handle

Return values      • **None**

**HAL\_ADCEx\_InjectedConfigChannel**

Function name      **HAL\_StatusTypeDef HAL\_ADCEx\_InjectedConfigChannel  
(ADC\_HandleTypeDef \* hadc, ADC\_InjectionConfTypeDef \*  
sConfigInjected)**

Function description      Configures the ADC injected group and the selected channel to be linked to the injected group.

Parameters      • **hadc:** ADC handle  
• **sConfigInjected:** Structure of ADC injected group and ADC channel for injected group.

Return values      • **None**

Notes      • Possibility to update parameters on the fly: This function initializes injected group, following calls to this function can be used to reconfigure some parameters of structure "ADC\_InjectionConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC\_InjectionConfTypeDef".  
 • In case of usage of internal measurement channels: Vbat/VrefInt/TempSensor. The recommended sampling time is at least: For devices STM32F37x: 17.1us for temperature sensorFor the other STM32F3 devices: 2.2us for each of channels Vbat/VrefInt/TempSensor. These internal paths can be disabled using function HAL\_ADC\_DeInit().  
 • To reset injected sequencer, function HAL\_ADCEx\_InjectedStop() can be used.  
 • Caution: For Injected Context Queue use: a context must be fully defined before start of injected conversion: all channels configured consecutively for the same ADC instance. Therefore, Number of calls of HAL\_ADCEx\_InjectedConfigChannel() must correspond to value of parameter InjectedNbrOfConversion for each context. Example 1: If 1 context intended to be used (or not use of this feature: QueueInjectedContext=DISABLE) and usage of the 3 first injected ranks (InjectedNbrOfConversion=3), HAL\_ADCEx\_InjectedConfigChannel() must be called once for each channel (3 times) before launching a conversion. This function must not be called to configure the 4th injected channel: it would start a new context into context queue.Example 2: If 2 contexts intended to be used and usage of the 3 first injected ranks (InjectedNbrOfConversion=3), HAL\_ADCEx\_InjectedConfigChannel() must be called once

for each channel and for each context (3 channels x 2 contexts = 6 calls). Conversion can start once the 1st context is set. The 2nd context can be set on the fly.

### **HAL\_ADCEx\_MultiModeConfigChannel**

***ADCEx Exported Macros*****`_HAL_ADC_ENABLE`****Description:**

- Enable the ADC peripheral.

**Parameters:**

- `_HANDLE_`: ADC handle

**Return value:**

- None

**Notes:**

- ADC enable requires a delay for ADC stabilization time (refer to device datasheet, parameter tSTAB) On STM32F3 devices, some hardware constraints must be strictly respected before using this macro: ADC internal voltage regulator must be preliminarily enabled. This is performed by function `HAL_ADC_Init()`. ADC state requirements: ADC must be disabled, no conversion on going, no calibration on going. These checks are performed by functions `HAL_ADC_start_xxx()`.

**`_HAL_ADC_DISABLE`****Description:**

- Disable the ADC peripheral.

**Parameters:**

- `_HANDLE_`: ADC handle

**Return value:**

- None

**Notes:**

- On STM32F3 devices, some hardware constraints must be strictly respected before using this macro: ADC state requirements: ADC must be enabled, no conversion on going. These checks are performed by functions

HAL\_ADC\_start\_xxx().

### \_HAL\_ADC\_ENABLE\_IT

#### Description:

- Enable the ADC end of conversion interrupt.

#### Parameters:

- \_HANDLE\_: ADC handle
- \_INTERRUPT\_: ADC Interrupt This parameter can be any combination of the following values:
  - ADC\_IT\_RDY: ADC Ready (ADRDY) interrupt source
  - ADC\_IT\_EOSMP: ADC End of Sampling interrupt source
  - ADC\_IT\_EOC: ADC End of Regular Conversion interrupt source
  - ADC\_IT\_EOS: ADC End of Regular sequence of Conversions interrupt source
  - ADC\_IT\_OVR: ADC overrun interrupt source
  - ADC\_IT\_JEOC: ADC End of Injected Conversion interrupt source
  - ADC\_IT\_JEOS: ADC End of Injected sequence of Conversions interrupt source
  - ADC\_IT\_AWD1: ADC Analog watchdog 1 interrupt source (main analog watchdog, present on all STM32 devices)
  - ADC\_IT\_AWD2: ADC Analog watchdog 2 interrupt source (additional analog watchdog, present only on STM32F3 devices)
  - ADC\_IT\_AWD3: ADC Analog watchdog 3 interrupt source (additional analog watchdog, present only on STM32F3 devices)
  - ADC\_IT\_JQOVF: ADC Injected Context Queue Overflow interrupt source

#### Return value:

- None

### \_HAL\_ADC\_DISABLE\_IT

#### Description:

- Disable the ADC end of conversion interrupt.

#### Parameters:

- \_HANDLE\_: ADC handle
- \_INTERRUPT\_: ADC Interrupt This parameter can be any combination of the

following values:

- ADC\_IT\_RDY: ADC Ready (ADRDY) interrupt source
- ADC\_IT\_EOSMP: ADC End of Sampling interrupt source
- ADC\_IT\_EOC: ADC End of Regular Conversion interrupt source
- ADC\_IT\_EOS: ADC End of Regular sequence of Conversions interrupt source
- ADC\_IT\_OVR: ADC overrun interrupt source
- ADC\_IT\_JEOC: ADC End of Injected Conversion interrupt source
- ADC\_IT\_JEOS: ADC End of Injected sequence of Conversions interrupt source
- ADC\_IT\_AWD1: ADC Analog watchdog 1 interrupt source (main analog watchdog, present on all STM32 devices)
- ADC\_IT\_AWD2: ADC Analog watchdog 2 interrupt source (additional analog watchdog, present only on STM32F3 devices)
- ADC\_IT\_AWD3: ADC Analog watchdog 3 interrupt source (additional analog watchdog, present only on STM32F3 devices)
- ADC\_IT\_JQOVF: ADC Injected Context Queue Overflow interrupt source

#### Return value:

- None

### \_\_HAL\_ADC\_GET\_IT\_SOURCE

#### Description:

- Checks if the specified ADC interrupt source is enabled or disabled.

#### Parameters:

- \_\_HANDLE\_\_: ADC handle
- \_\_INTERRUPT\_\_: ADC interrupt source to check This parameter can be any combination of the following values:
  - ADC\_IT\_RDY: ADC Ready (ADRDY) interrupt source
  - ADC\_IT\_EOSMP: ADC End of Sampling interrupt source
  - ADC\_IT\_EOC: ADC End of Regular Conversion interrupt source
  - ADC\_IT\_EOS: ADC End of Regular sequence of Conversions interrupt source

- ADC\_IT\_OVR: ADC overrun interrupt source
- ADC\_IT\_JEOC: ADC End of Injected Conversion interrupt source
- ADC\_IT\_JEOS: ADC End of Injected sequence of Conversions interrupt source
- ADC\_IT\_AWD1: ADC Analog watchdog 1 interrupt source (main analog watchdog, present on all STM32 devices)
- ADC\_IT\_AWD2: ADC Analog watchdog 2 interrupt source (additional analog watchdog, present only on STM32F3 devices)
- ADC\_IT\_AWD3: ADC Analog watchdog 3 interrupt source (additional analog watchdog, present only on STM32F3 devices)
- ADC\_IT\_JQOVF: ADC Injected Context Queue Overflow interrupt source

**Return value:**

- State: of interruption (SET or RESET)

**\_HAL\_ADC\_GET\_FLAG****Description:**

- Get the selected ADC's flag status.

**Parameters:**

- HANDLE: ADC handle
- FLAG: ADC flag This parameter can be any combination of the following values:
  - ADC\_FLAG\_RDY: ADC Ready (ADRDY) flag
  - ADC\_FLAG\_EOSMP: ADC End of Sampling flag
  - ADC\_FLAG\_EOC: ADC End of Regular Conversion flag
  - ADC\_FLAG\_EOS: ADC End of Regular sequence of Conversions flag
  - ADC\_FLAG\_OVR: ADC overrun flag
  - ADC\_FLAG\_JEOC: ADC End of Injected Conversion flag
  - ADC\_FLAG\_JEOS: ADC End of Injected sequence of Conversions flag
  - ADC\_FLAG\_AWD1: ADC Analog watchdog 1 flag (main analog watchdog, present on all STM32 devices)
  - ADC\_FLAG\_AWD2: ADC Analog watchdog 2 flag (additional analog watchdog, present only on STM32F3 devices)

- ADC\_FLAG\_AWD3: ADC Analog watchdog 3 flag (additional analog watchdog, present only on STM32F3 devices)
- ADC\_FLAG\_JQOVF: ADC Injected Context Queue Overflow flag

**Return value:**

- None

[\\_\\_HAL\\_ADC\\_CLEAR\\_FLAG](#)**Description:**

- Clear the ADC's pending flags.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): ADC handle
- [\\_\\_FLAG\\_\\_](#): ADC flag This parameter can be any combination of the following values:
  - ADC\_FLAG\_RDY: ADC Ready (ADRDY) flag
  - ADC\_FLAG\_EOSMP: ADC End of Sampling flag
  - ADC\_FLAG\_EOC: ADC End of Regular Conversion flag
  - ADC\_FLAG\_EOS: ADC End of Regular sequence of Conversions flag
  - ADC\_FLAG\_OVR: ADC overrun flag
  - ADC\_FLAG\_JEOC: ADC End of Injected Conversion flag
  - ADC\_FLAG\_JEOS: ADC End of Injected sequence of Conversions flag
  - ADC\_FLAG\_AWD1: ADC Analog watchdog 1 flag (main analog watchdog, present on all STM32 devices)
  - ADC\_FLAG\_AWD2: ADC Analog watchdog 2 flag (additional analog watchdog, present only on STM32F3 devices)
  - ADC\_FLAG\_AWD3: ADC Analog watchdog 3 flag (additional analog watchdog, present only on STM32F3 devices)
  - ADC\_FLAG\_JQOVF: ADC Injected Context Queue Overflow flag

**Return value:**

- None

[\\_\\_HAL\\_ADC\\_RESET\\_HANDLE\\_STATE](#)**Description:**

- Reset ADC handle state.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): ADC handle

**Return value:**

- None

## 8 HAL CAN Generic Driver

### 8.1 CAN Firmware driver registers structures

#### 8.1.1 CAN\_InitTypeDef

##### Data Fields

- *uint32\_t Prescaler*
- *uint32\_t Mode*
- *uint32\_t SJW*
- *uint32\_t BS1*
- *uint32\_t BS2*
- *uint32\_t TTCM*
- *uint32\_t ABOM*
- *uint32\_t AWUM*
- *uint32\_t NART*
- *uint32\_t RFLM*
- *uint32\_t TXFP*

##### Field Documentation

- ***uint32\_t CAN\_InitTypeDef::Prescaler***  
Specifies the length of a time quantum. This parameter must be a number between Min\_Data = 1 and Max\_Data = 1024.
- ***uint32\_t CAN\_InitTypeDef::Mode***  
Specifies the CAN operating mode. This parameter can be a value of [\*CAN\\_operating\\_mode\*](#)
- ***uint32\_t CAN\_InitTypeDef::SJW***  
Specifies the maximum number of time quanta the CAN hardware is allowed to lengthen or shorten a bit to perform resynchronization. This parameter can be a value of [\*CAN\\_synchronisation\\_jump\\_width\*](#)
- ***uint32\_t CAN\_InitTypeDef::BS1***  
Specifies the number of time quanta in Bit Segment 1. This parameter can be a value of [\*CAN\\_time\\_quantum\\_in\\_bit\\_segment\\_1\*](#)
- ***uint32\_t CAN\_InitTypeDef::BS2***  
Specifies the number of time quanta in Bit Segment 2. This parameter can be a value of [\*CAN\\_time\\_quantum\\_in\\_bit\\_segment\\_2\*](#)
- ***uint32\_t CAN\_InitTypeDef::TTCM***  
Enable or disable the time triggered communication mode. This parameter can be set to ENABLE or DISABLE.
- ***uint32\_t CAN\_InitTypeDef::ABOM***  
Enable or disable the automatic bus-off management. This parameter can be set to ENABLE or DISABLE.
- ***uint32\_t CAN\_InitTypeDef::AWUM***  
Enable or disable the automatic wake-up mode. This parameter can be set to ENABLE or DISABLE.
- ***uint32\_t CAN\_InitTypeDef::NART***  
Enable or disable the non-automatic retransmission mode. This parameter can be set to ENABLE or DISABLE.
- ***uint32\_t CAN\_InitTypeDef::RFLM***  
Enable or disable the Receive FIFO Locked mode. This parameter can be set to ENABLE or DISABLE.

- ***uint32\_t CAN\_InitTypeDef::TXFP***  
Enable or disable the transmit FIFO priority. This parameter can be set to ENABLE or DISABLE.

## 8.1.2 CAN\_FilterConfTypeDef

### Data Fields

- ***uint32\_t FilterIdHigh***
- ***uint32\_t FilterIdLow***
- ***uint32\_t FilterMaskIdHigh***
- ***uint32\_t FilterMaskIdLow***
- ***uint32\_t FilterFIFOAssignment***
- ***uint32\_t FilterNumber***
- ***uint32\_t FilterMode***
- ***uint32\_t FilterScale***
- ***uint32\_t FilterActivation***
- ***uint32\_t BankNumber***

### Field Documentation

- ***uint32\_t CAN\_FilterConfTypeDef::FilterIdHigh***  
Specifies the filter identification number (MSBs for a 32-bit configuration, first one for a 16-bit configuration). This parameter must be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFF.
- ***uint32\_t CAN\_FilterConfTypeDef::FilterIdLow***  
Specifies the filter identification number (LSBs for a 32-bit configuration, second one for a 16-bit configuration). This parameter must be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFF.
- ***uint32\_t CAN\_FilterConfTypeDef::FilterMaskIdHigh***  
Specifies the filter mask number or identification number, according to the mode (MSBs for a 32-bit configuration, first one for a 16-bit configuration). This parameter must be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFF.
- ***uint32\_t CAN\_FilterConfTypeDef::FilterMaskIdLow***  
Specifies the filter mask number or identification number, according to the mode (LSBs for a 32-bit configuration, second one for a 16-bit configuration). This parameter must be a number between Min\_Data = 0x0000 and Max\_Data = 0xFFFF.
- ***uint32\_t CAN\_FilterConfTypeDef::FilterFIFOAssignment***  
Specifies the FIFO (0 or 1U) which will be assigned to the filter. This parameter can be a value of [CAN\\_filter\\_FIFO](#)
- ***uint32\_t CAN\_FilterConfTypeDef::FilterNumber***  
Specifies the filter which will be initialized. This parameter must be a number between Min\_Data = 0 and Max\_Data = 27.
- ***uint32\_t CAN\_FilterConfTypeDef::FilterMode***  
Specifies the filter mode to be initialized. This parameter can be a value of [CAN\\_filter\\_mode](#)
- ***uint32\_t CAN\_FilterConfTypeDef::FilterScale***  
Specifies the filter scale. This parameter can be a value of [CAN\\_filter\\_scale](#)
- ***uint32\_t CAN\_FilterConfTypeDef::FilterActivation***  
Enable or disable the filter. This parameter can be set to ENABLE or DISABLE.
- ***uint32\_t CAN\_FilterConfTypeDef::BankNumber***  
Select the start slave bank filter F3 devices don't support CAN2 interface (Slave). Therefore this parameter is meaningless but it has been kept for compatibility accross STM32 families

### 8.1.3 CanTxMsgTypeDef

#### Data Fields

- *uint32\_t StdId*
- *uint32\_t ExtId*
- *uint32\_t IDE*
- *uint32\_t RTR*
- *uint32\_t DLC*
- *uint8\_t Data*

#### Field Documentation

- ***uint32\_t CanTxMsgTypeDef::StdId***  
Specifies the standard identifier. This parameter must be a number between Min\_Data = 0 and Max\_Data = 0x7FF.
- ***uint32\_t CanTxMsgTypeDef::ExtId***  
Specifies the extended identifier. This parameter must be a number between Min\_Data = 0 and Max\_Data = 0x1FFFFFFF.
- ***uint32\_t CanTxMsgTypeDef::IDE***  
Specifies the type of identifier for the message that will be transmitted. This parameter can be a value of [CAN\\_identifier\\_type](#)
- ***uint32\_t CanTxMsgTypeDef::RTR***  
Specifies the type of frame for the message that will be transmitted. This parameter can be a value of [CAN\\_remote\\_transmission\\_request](#)
- ***uint32\_t CanTxMsgTypeDef::DLC***  
Specifies the length of the frame that will be transmitted. This parameter must be a number between Min\_Data = 0 and Max\_Data = 8.
- ***uint8\_t CanTxMsgTypeDef::Data[8]***  
Contains the data to be transmitted. This parameter must be a number between Min\_Data = 0 and Max\_Data = 0xFF.

### 8.1.4 CanRxMsgTypeDef

#### Data Fields

- *uint32\_t StdId*
- *uint32\_t ExtId*
- *uint32\_t IDE*
- *uint32\_t RTR*
- *uint32\_t DLC*
- *uint8\_t Data*
- *uint32\_t FMI*
- *uint32\_t FIFONumber*

#### Field Documentation

- ***uint32\_t CanRxMsgTypeDef::StdId***  
Specifies the standard identifier. This parameter must be a number between Min\_Data = 0 and Max\_Data = 0x7FF.
- ***uint32\_t CanRxMsgTypeDef::ExtId***  
Specifies the extended identifier. This parameter must be a number between Min\_Data = 0 and Max\_Data = 0x1FFFFFFF.
- ***uint32\_t CanRxMsgTypeDef::IDE***  
Specifies the type of identifier for the message that will be received. This parameter can be a value of [CAN\\_identifier\\_type](#)

- ***uint32\_t CanRxMsgTypeDef::RTR***  
Specifies the type of frame for the received message. This parameter can be a value of **CAN\_remote\_transmission\_request**
- ***uint32\_t CanRxMsgTypeDef::DLC***  
Specifies the length of the frame that will be received. This parameter must be a number between Min\_Data = 0 and Max\_Data = 8.
- ***uint8\_t CanRxMsgTypeDef::Data[8]***  
Contains the data to be received. This parameter must be a number between Min\_Data = 0 and Max\_Data = 0xFF.
- ***uint32\_t CanRxMsgTypeDef::FMI***  
Specifies the index of the filter the message stored in the mailbox passes through. This parameter must be a number between Min\_Data = 0 and Max\_Data = 0xFF.
- ***uint32\_t CanRxMsgTypeDef::FIFONumber***  
Specifies the receive FIFO number. This parameter can be CAN\_FIFO0 or CAN\_FIFO1

## 8.1.5 CAN\_HandleTypeDef

### Data Fields

- ***CAN\_TypeDef \* Instance***
- ***CAN\_InitTypeDef Init***
- ***CanTxMsgTypeDef \* pTxMsg***
- ***CanRxMsgTypeDef \* pRxMsg***
- ***CanRxMsgTypeDef \* pRx1Msg***
- ***HAL\_LockTypeDef Lock***
- ***\_\_IO HAL\_CAN\_StateTypeDef State***
- ***\_\_IO uint32\_t ErrorCode***

### Field Documentation

- ***CAN\_TypeDef\* CAN\_HandleTypeDef::Instance***  
Register base address
- ***CAN\_InitTypeDef CAN\_HandleTypeDef::Init***  
CAN required parameters
- ***CanTxMsgTypeDef\* CAN\_HandleTypeDef::pTxMsg***  
Pointer to transmit structure
- ***CanRxMsgTypeDef\* CAN\_HandleTypeDef::pRxMsg***  
Pointer to reception structure for RX FIFO0 msg
- ***CanRxMsgTypeDef\* CAN\_HandleTypeDef::pRx1Msg***  
Pointer to reception structure for RX FIFO1 msg
- ***HAL\_LockTypeDef CAN\_HandleTypeDef::Lock***  
CAN locking object
- ***\_\_IO HAL\_CAN\_StateTypeDef CAN\_HandleTypeDef::State***  
CAN communication state
- ***\_\_IO uint32\_t CAN\_HandleTypeDef::ErrorCode***  
CAN Error code This parameter can be a value of **CAN\_Error\_Code**

## 8.2 CAN Firmware driver API description

### 8.2.1 How to use this driver

1. Enable the CAN controller interface clock using `__HAL_RCC_CAN1_CLK_ENABLE();`
2. CAN pins configuration
  - Enable the clock for the CAN GPIOs using the following function:  
`__HAL_RCC_GPIOx_CLK_ENABLE();`

- Connect and configure the involved CAN pins to AF9 using the following function `HAL_GPIO_Init()`;
- 3. Initialise and configure the CAN using `HAL_CAN_Init()` function.
- 4. Transmit the desired CAN frame using `HAL_CAN_Transmit()` function.
- 5. Or transmit the desired CAN frame using `HAL_CAN_Transmit_IT()` function.
- 6. Receive a CAN frame using `HAL_CAN_Receive()` function.
- 7. Or receive a CAN frame using `HAL_CAN_Receive_IT()` function.

### Polling mode IO operation

- Start the CAN peripheral transmission and wait the end of this operation using `HAL_CAN_Transmit()`, at this stage user can specify the value of timeout according to his end application
- Start the CAN peripheral reception and wait the end of this operation using `HAL_CAN_Receive()`, at this stage user can specify the value of timeout according to his end application

### Interrupt mode IO operation

- Start the CAN peripheral transmission using `HAL_CAN_Transmit_IT()`
- Start the CAN peripheral reception using `HAL_CAN_Receive_IT()`
- Use `HAL_CAN_IRQHandler()` called under the used CAN Interrupt subroutine
- At CAN end of transmission `HAL_CAN_TxCpltCallback()` function is executed and user can add his own code by customization of function pointer `HAL_CAN_TxCpltCallback`
- In case of CAN Error, `HAL_CAN_ErrorCallback()` function is executed and user can add his own code by customization of function pointer `HAL_CAN_ErrorCallback`

### CAN HAL driver macros list

Below the list of most used macros in CAN HAL driver.

- `_HAL_CAN_ENABLE_IT`: Enable the specified CAN interrupts
- `_HAL_CAN_DISABLE_IT`: Disable the specified CAN interrupts
- `_HAL_CAN_GET_IT_SOURCE`: Check if the specified CAN interrupt source is enabled or disabled
- `_HAL_CAN_CLEAR_FLAG`: Clear the CAN's pending flags
- `_HAL_CAN_GET_FLAG`: Get the selected CAN's flag status

You can refer to the CAN HAL driver header file for more useful macros

## 8.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the CAN.
- De-initialize the CAN.

This section contains the following APIs:

- [`HAL\_CAN\_Init\(\)`](#)
- [`HAL\_CAN\_ConfigFilter\(\)`](#)
- [`HAL\_CAN\_DeInit\(\)`](#)
- [`HAL\_CAN\_MspInit\(\)`](#)

- [\*HAL\\_CAN\\_MspDeInit\(\)\*](#)

### 8.2.3 Peripheral State and Error functions

This subsection provides functions allowing to :

- Check the CAN state.
- Check CAN Errors detected during interrupt process

This section contains the following APIs:

- [\*HAL\\_CAN\\_GetState\(\)\*](#)
- [\*HAL\\_CAN\\_GetError\(\)\*](#)

### 8.2.4 Detailed description of functions

#### **HAL\_CAN\_Init**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_Init (CAN_HandleTypeDef * hcan)</b>                                                                                                             |
| Function description | Initializes the CAN peripheral according to the specified parameters in the CAN_InitStruct.                                                                                  |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                       |

#### **HAL\_CAN\_ConfigFilter**

|                      |                                                                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_ConfigFilter (CAN_HandleTypeDef * hcan, CAN_FilterConfTypeDef * sFilterConfig)</b>                                                                                                                                                                                                |
| Function description | Configures the CAN reception filter according to the specified parameters in the CAN_FilterInitStruct.                                                                                                                                                                                                         |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li> <li>• <b>sFilterConfig:</b> pointer to a CAN_FilterConfTypeDef structure that contains the filter configuration information.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                                                                                                                                                |

#### **HAL\_CAN\_DeInit**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_DeInit (CAN_HandleTypeDef * hcan)</b>                                                                                                           |
| Function description | Deinitializes the CANx peripheral registers to their default reset values.                                                                                                   |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                       |

**HAL\_CAN\_MspInit**

|                      |                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_CAN_MspInit (CAN_HandleTypeDef * hcan)</b>                                                                                                                     |
| Function description | Initializes the CAN MSP.                                                                                                                                                   |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>                                                                                                              |

**HAL\_CAN\_MspDelInit**

|                      |                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_CAN_MspDelInit (CAN_HandleTypeDef * hcan)</b>                                                                                                                  |
| Function description | Deinitializes the CAN MSP.                                                                                                                                                 |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>                                                                                                              |

**HAL\_CAN\_Transmit**

|                      |                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_Transmit (CAN_HandleTypeDef * hcan, uint32_t Timeout)</b>                                                                                                                                 |
| Function description | Initiates and transmits a CAN frame message.                                                                                                                                                                           |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li><li>• <b>Timeout:</b> Timeout duration.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>                                                                                                                                                   |

**HAL\_CAN\_Transmit\_IT**

|                      |                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_Transmit_IT (CAN_HandleTypeDef * hcan)</b>                                                                                                    |
| Function description | Initiates and transmits a CAN frame message.                                                                                                                               |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>                                                                                                       |

**HAL\_CAN\_Receive**

|                      |                                                                                                                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_Receive (CAN_HandleTypeDef * hcan, uint8_t FIFONumber, uint32_t Timeout)</b>                                                                                                                                                        |
| Function description | Receives a correct CAN frame.                                                                                                                                                                                                                                    |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li><li>• <b>FIFONumber:</b> FIFO number.</li><li>• <b>Timeout:</b> Timeout duration.</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>                                                                                                                                                                                             |

**HAL\_CAN\_Receive\_IT**

|                      |                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_Receive_IT<br/>(CAN_HandleTypeDef * hcan, uint8_t FIFONumber)</b>                                                                                                                          |
| Function description | Receives a correct CAN frame.                                                                                                                                                                                           |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcan:</b> pointer to a CAN_HandleTypeDef structure that contains the configuration information for the specified CAN.</li> <li>• <b>FIFONumber:</b> FIFO number.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                  |

**HAL\_CAN\_Sleep**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CAN_Sleep (CAN_HandleTypeDef * hcan)</b>                                                                                                            |
| Function description | Enters the Sleep (low power) mode.                                                                                                                                           |

## 8.3 CAN Firmware driver defines

### 8.3.1 CAN

**CAN Error Code**

|                           |             |
|---------------------------|-------------|
| <b>HAL_CAN_ERROR_NONE</b> | No error    |
| <b>HAL_CAN_ERROR_EWG</b>  | EWG error   |
| <b>HAL_CAN_ERROR_EPV</b>  | EPV error   |
| <b>HAL_CAN_ERROR_BOF</b>  | BOF error   |
| <b>HAL_CAN_ERROR_STF</b>  | Stuff error |
| <b>HAL_CAN_ERROR_FOR</b>  | Form error  |

|                      |                      |
|----------------------|----------------------|
| HAL_CAN_ERROR_ACK    | Acknowledgment error |
| HAL_CAN_ERROR_BR     | Bit recessive        |
| HAL_CAN_ERROR_BD     | LEC dominant         |
| HAL_CAN_ERROR_CRC    | LEC transfer error   |
| HAL_CAN_ERROR_FOV0   | FIFO0 overrun error  |
| HAL_CAN_ERROR_FOV1   | FIFO1 overrun error  |
| HAL_CAN_ERROR_TXFAIL | Transmit failure     |

**CAN Exported Macros**

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                |

[\\_\\_HAL\\_CAN\\_GET\\_FLAG](#)**Description:**

- Check whether the specified CAN flag is set or not.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the CAN Handle.
- [\\_\\_FLAG\\_\\_](#): specifies the flag to check.  
This parameter can be one of the following values:
  - CAN\_TSR\_RQCP0: Request MailBox0 Flag
  - CAN\_TSR\_RQCP1: Request MailBox1 Flag
  - CAN\_TSR\_RQCP2: Request MailBox2 Flag
  - CAN\_FLAG\_TXOK0: Transmission OK MailBox0 Flag
  - CAN\_FLAG\_TXOK1: Transmission OK MailBox1 Flag
  - CAN\_FLAG\_TXOK2: Transmission OK MailBox2 Flag
  - CAN\_FLAG\_TME0: Transmit mailbox 0 empty Flag
  - CAN\_FLAG\_TME1: Transmit mailbox 1 empty Flag
  - CAN\_FLAG\_TME2: Transmit mailbox 2 empty Flag
  - CAN\_FLAG\_FMP0: FIFO 0 Message Pending Flag
  - CAN\_FLAG\_FF0: FIFO 0 Full Flag
  - CAN\_FLAG\_FOV0: FIFO 0 Overrun Flag
  - CAN\_FLAG\_FMP1: FIFO 1 Message Pending Flag
  - CAN\_FLAG\_FF1: FIFO 1 Full Flag
  - CAN\_FLAG\_FOV1: FIFO 1 Overrun Flag
  - CAN\_FLAG\_WKU: Wake up Flag
  - CAN\_FLAG\_SLAK: Sleep acknowledge Flag
  - CAN\_FLAG\_SLAKI: Sleep acknowledge Flag
  - CAN\_FLAG\_EWG: Error Warning Flag
  - CAN\_FLAG\_EPV: Error Passive Flag
  - CAN\_FLAG\_BOF: Bus-Off Flag

**Return value:**

- The new state of [\\_\\_FLAG\\_\\_](#) (TRUE or FALSE).

[\\_\\_HAL\\_CAN\\_CLEAR\\_FLAG](#)**Description:**

- Clear the specified CAN pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the CAN Handle.
- \_\_FLAG\_\_: specifies the flag to check.  
This parameter can be one of the following values:
  - CAN\_TSR\_RQCP0: Request MailBox0 Flag
  - CAN\_TSR\_RQCP1: Request MailBox1 Flag
  - CAN\_TSR\_RQCP2: Request MailBox2 Flag
  - CAN\_FLAG\_TXOK0: Transmission OK MailBox0 Flag
  - CAN\_FLAG\_TXOK1: Transmission OK MailBox1 Flag
  - CAN\_FLAG\_TXOK2: Transmission OK MailBox2 Flag
  - CAN\_FLAG\_TME0: Transmit mailbox 0 empty Flag
  - CAN\_FLAG\_TME1: Transmit mailbox 1 empty Flag
  - CAN\_FLAG\_TME2: Transmit mailbox 2 empty Flag
  - CAN\_FLAG\_FMP0: FIFO 0 Message Pending Flag
  - CAN\_FLAG\_FF0: FIFO 0 Full Flag
  - CAN\_FLAG\_FOV0: FIFO 0 Overrun Flag
  - CAN\_FLAG\_FMP1: FIFO 1 Message Pending Flag
  - CAN\_FLAG\_FF1: FIFO 1 Full Flag
  - CAN\_FLAG\_FOV1: FIFO 1 Overrun Flag
  - CAN\_FLAG\_WKU: Wake up Flag
  - CAN\_FLAG\_SLAKI: Sleep acknowledge Flag
  - CAN\_FLAG\_EWG: Error Warning Flag
  - CAN\_FLAG\_EPV: Error Passive Flag
  - CAN\_FLAG\_BOF: Bus-Off Flag

**Return value:**

- The new state of \_\_FLAG\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_CAN\\_GET\\_IT\\_SOURCE](#)**Description:**

- Check if the specified CAN interrupt source is enabled or disabled.

**Parameters:**

- \_\_HANDLE\_\_: specifies the CAN Handle.
- \_\_INTERRUPT\_\_: specifies the CAN interrupt source to check. This parameter

can be one of the following values:

- CAN\_IT\_TME: Transmit mailbox empty interrupt enable
- CAN\_IT\_FMP0: FIFO0 message pending interrupt enable
- CAN\_IT\_FMP1: FIFO1 message pending interrupt enable

**Return value:**

- The: new state of \_\_IT\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_CAN\\_TRANSMIT\\_STATUS](#)

**Description:**

- Check the transmission status of a CAN Frame.

**Parameters:**

- \_\_HANDLE\_\_: CAN handle.
- \_\_TRANSMITMAILBOX\_\_: the number of the mailbox that is used for transmission.

**Return value:**

- The: new status of transmission (TRUE or FALSE).

[\\_\\_HAL\\_CAN\\_FIFO\\_RELEASE](#)

**Description:**

- Release the specified receive FIFO.

**Parameters:**

- \_\_HANDLE\_\_: CAN handle.
- \_\_FIFONUMBER\_\_: Receive FIFO number, CAN\_FIFO0 or CAN\_FIFO1.

**Return value:**

- None

[\\_\\_HAL\\_CAN\\_CANCEL\\_TRANSMIT](#)

**Description:**

- Cancel a transmit request.

**Parameters:**

- \_\_HANDLE\_\_: specifies the CAN Handle.
- \_\_TRANSMITMAILBOX\_\_: the number of the mailbox that is used for transmission.

**Return value:**

- None

[\\_\\_HAL\\_CAN\\_DBG\\_FREEZE](#)

**Description:**

- Enable or disables the DBG Freeze for CAN.

**Parameters:**

- \_\_HANDLE\_\_: specifies the CAN Handle.
- \_\_NEWSTATE\_\_: new state of the CAN

peripheral. This parameter can be:  
ENABLE (CAN reception/transmission is frozen during debug. Reception FIFOs can still be accessed/controlled normally) or  
DISABLE (CAN is working during debug).

**Return value:**

- None

**CAN Filter FIFO**

|                  |                                       |
|------------------|---------------------------------------|
| CAN_FILTER_FIFO0 | Filter FIFO 0 assignment for filter x |
| CAN_FILTER_FIFO1 | Filter FIFO 1 assignment for filter x |

**CAN Filter Mode**

|                       |                      |
|-----------------------|----------------------|
| CAN_FILTERMODE_IDMASK | Identifier mask mode |
| CAN_FILTERMODE_IDLIST | Identifier list mode |

**CAN Filter Scale**

|                       |                    |
|-----------------------|--------------------|
| CAN_FILTERSCALE_16BIT | Two 16-bit filters |
| CAN_FILTERSCALE_32BIT | One 32-bit filter  |

**CAN Flags**

|                |                                 |
|----------------|---------------------------------|
| CAN_FLAG_RQCP0 | Request MailBox0 flag           |
| CAN_FLAG_RQCP1 | Request MailBox1 flag           |
| CAN_FLAG_RQCP2 | Request MailBox2 flag           |
| CAN_FLAG_TXOK0 | Transmission OK MailBox0 flag   |
| CAN_FLAG_TXOK1 | Transmission OK MailBox1 flag   |
| CAN_FLAG_TXOK2 | Transmission OK MailBox2 flag   |
| CAN_FLAG_TME0  | Transmit mailbox 0 empty flag   |
| CAN_FLAG_TME1  | Transmit mailbox 0 empty flag   |
| CAN_FLAG_TME2  | Transmit mailbox 0 empty flag   |
| CAN_FLAG_FF0   | FIFO 0 Full flag                |
| CAN_FLAG_FOV0  | FIFO 0 Overrun flag             |
| CAN_FLAG_FF1   | FIFO 1 Full flag                |
| CAN_FLAG_FOV1  | FIFO 1 Overrun flag             |
| CAN_FLAG_INAK  | Initialization acknowledge flag |
| CAN_FLAG_SLAK  | Sleep acknowledge flag          |
| CAN_FLAG_ERRI  | Error flag                      |
| CAN_FLAG_WKU   | Wake up flag                    |
| CAN_FLAG_SLAKI | Sleep acknowledge flag          |
| CAN_FLAG_EWG   | Error warning flag              |
| CAN_FLAG_EPV   | Error passive flag              |
| CAN_FLAG_BOF   | Bus-Off flag                    |

**CAN Identifier Type**

|            |             |
|------------|-------------|
| CAN_ID_STD | Standard Id |
| CAN_ID_EXT | Extended Id |

**CAN InitStatus**

|                        |                           |
|------------------------|---------------------------|
| CAN_INITSTATUS_FAILED  | CAN initialization failed |
| CAN_INITSTATUS_SUCCESS | CAN initialization OK     |

**CAN Interrupts**

|             |                                  |
|-------------|----------------------------------|
| CAN_IT_TME  | Transmit mailbox empty interrupt |
| CAN_IT_FMP0 | FIFO 0 message pending interrupt |
| CAN_IT_FF0  | FIFO 0 full interrupt            |
| CAN_IT_FOV0 | FIFO 0 overrun interrupt         |
| CAN_IT_FMP1 | FIFO 1 message pending interrupt |
| CAN_IT_FF1  | FIFO 1 full interrupt            |
| CAN_IT_FOV1 | FIFO 1 overrun interrupt         |
| CAN_IT_WKU  | Wake-up interrupt                |
| CAN_IT_SLK  | Sleep acknowledge interrupt      |
| CAN_IT_EWG  | Error warning interrupt          |
| CAN_IT_EPV  | Error passive interrupt          |
| CAN_IT_BOF  | Bus-off interrupt                |
| CAN_IT_LEC  | Last error code interrupt        |
| CAN_IT_ERR  | Error Interrupt                  |

**CAN Mailboxes**

|                 |
|-----------------|
| CAN_TXMAILBOX_0 |
| CAN_TXMAILBOX_1 |
| CAN_TXMAILBOX_2 |

**CAN Operating Mode**

|                          |                                    |
|--------------------------|------------------------------------|
| CAN_MODE_NORMAL          | Normal mode                        |
| CAN_MODE_LOOPBACK        | Loopback mode                      |
| CAN_MODE_SILENT          | Silent mode                        |
| CAN_MODE_SILENT_LOOPBACK | Loopback combined with silent mode |

**CAN Receive FIFO Number**

|           |                            |
|-----------|----------------------------|
| CAN_FIFO0 | CAN FIFO 0 used to receive |
| CAN_FIFO1 | CAN FIFO 1 used to receive |

**CAN Remote Transmission Request**

|                |              |
|----------------|--------------|
| CAN_RTR_DATA   | Data frame   |
| CAN_RTR_REMOTE | Remote frame |

**CAN Synchronization Jump Width**

|             |                |
|-------------|----------------|
| CAN_SJW_1TQ | 1 time quantum |
| CAN_SJW_2TQ | 2 time quantum |
| CAN_SJW_3TQ | 3 time quantum |
| CAN_SJW_4TQ | 4 time quantum |

**CAN Time Quantum in Bit Segment 1**

|              |                 |
|--------------|-----------------|
| CAN_BS1_1TQ  | 1 time quantum  |
| CAN_BS1_2TQ  | 2 time quantum  |
| CAN_BS1_3TQ  | 3 time quantum  |
| CAN_BS1_4TQ  | 4 time quantum  |
| CAN_BS1_5TQ  | 5 time quantum  |
| CAN_BS1_6TQ  | 6 time quantum  |
| CAN_BS1_7TQ  | 7 time quantum  |
| CAN_BS1_8TQ  | 8 time quantum  |
| CAN_BS1_9TQ  | 9 time quantum  |
| CAN_BS1_10TQ | 10 time quantum |
| CAN_BS1_11TQ | 11 time quantum |
| CAN_BS1_12TQ | 12 time quantum |
| CAN_BS1_13TQ | 13 time quantum |
| CAN_BS1_14TQ | 14 time quantum |
| CAN_BS1_15TQ | 15 time quantum |
| CAN_BS1_16TQ | 16 time quantum |

**CAN Time Quantum in Bit Segment 2**

|             |                |
|-------------|----------------|
| CAN_BS2_1TQ | 1 time quantum |
| CAN_BS2_2TQ | 2 time quantum |
| CAN_BS2_3TQ | 3 time quantum |
| CAN_BS2_4TQ | 4 time quantum |
| CAN_BS2_5TQ | 5 time quantum |
| CAN_BS2_6TQ | 6 time quantum |
| CAN_BS2_7TQ | 7 time quantum |
| CAN_BS2_8TQ | 8 time quantum |

## 9 HAL CEC Generic Driver

### 9.1 CEC Firmware driver registers structures

#### 9.1.1 CEC\_InitTypeDef

##### Data Fields

- *uint32\_t SignalFreeTime*
- *uint32\_t Tolerance*
- *uint32\_t BRERxStop*
- *uint32\_t BREErrorBitGen*
- *uint32\_t LBPEErrorBitGen*
- *uint32\_t BroadcastMsgNoErrorBitGen*
- *uint32\_t SignalFreeTimeOption*
- *uint32\_t ListenMode*
- *uint16\_t OwnAddress*
- *uint8\_t \* RxBuffer*

##### Field Documentation

- ***uint32\_t CEC\_InitTypeDef::SignalFreeTime***  
Set SFT field, specifies the Signal Free Time. It can be one of **CEC\_Signal\_Free\_Time** and belongs to the set {0U,...,7} where 0x0 is the default configuration else means 0.5U + (SignalFreeTime - 1U) nominal data bit periods
- ***uint32\_t CEC\_InitTypeDef::Tolerance***  
Set RXTOL bit, specifies the tolerance accepted on the received waveforms, it can be a value of **CEC\_Tolerance** : it is either CEC\_STANDARD\_TOLERANCE or CEC\_EXTENDED\_TOLERANCE
- ***uint32\_t CEC\_InitTypeDef::BRERxStop***  
Set BRESTRP bit **CEC\_BRERxStop** : specifies whether or not a Bit Rising Error stops the reception. CEC\_NO\_RX\_STOP\_ON\_BRE: reception is not stopped. CEC\_RX\_STOP\_ON\_BRE: reception is stopped.
- ***uint32\_t CEC\_InitTypeDef::BREErrorBitGen***  
Set BREGEN bit **CEC\_BREErrorBitGen** : specifies whether or not an Error-Bit is generated on the CEC line upon Bit Rising Error detection.  
CEC\_BRE\_ERRORBIT\_NO\_GENERATION: no error-bit generation.  
CEC\_BRE\_ERRORBIT\_GENERATION: error-bit generation if BRESTRP is set.
- ***uint32\_t CEC\_InitTypeDef::LBPEErrorBitGen***  
Set LBPEGEN bit **CEC\_LBPEErrorBitGen** : specifies whether or not an Error-Bit is generated on the CEC line upon Long Bit Period Error detection.  
CEC\_LBPE\_ERRORBIT\_NO\_GENERATION: no error-bit generation.  
CEC\_LBPE\_ERRORBIT\_GENERATION: error-bit generation.
- ***uint32\_t CEC\_InitTypeDef::BroadcastMsgNoErrorBitGen***  
Set BRDNOGEN bit **CEC\_BroadcastMsgErrorBitGen** : allows to avoid an Error-Bit generation on the CEC line upon an error detected on a broadcast message. It supersedes BREGEN and LBPEGEN bits for a broadcast message error handling. It can take two values:1U) CEC\_BROADCASTERROR\_ERRORBIT\_GENERATION. a) BRE detection: error-bit generation on the CEC line if BRESTRP=CEC\_RX\_STOP\_ON\_BRE and BREGEN=CEC\_BRE\_ERRORBIT\_NO\_GENERATION. b) LBPE detection: error-bit generation on the CEC line if LBPGEN=CEC\_LBPE\_ERRORBIT\_NO\_GENERATION.2U)

CEC\_BROADCASTERROR\_NO\_ERRORBIT\_GENERATION. no error-bit generation in case neither a) nor b) are satisfied. Additionally, there is no error-bit generation in case of Short Bit Period Error detection in a broadcast message while LSTN bit is set.

- ***uint32\_t CEC\_InitTypeDef::SignalFreeTimeOption***  
Set SFTOP bit ***CEC\_SFT\_Option*** : specifies when SFT timer starts.  
CEC\_SFT\_START\_ON\_TXSOM SFT: timer starts when TXSOM is set by software.  
CEC\_SFT\_START\_ON\_RX\_END: SFT timer starts automatically at the end of message transmission/reception.
- ***uint32\_t CEC\_InitTypeDef::ListenMode***  
Set LSTN bit ***CEC\_Listening\_Mode*** : specifies device listening mode. It can take two values:  
CEC\_REDUCED\_LISTENING\_MODE: CEC peripheral receives only message addressed to its own address (OAR). Messages addressed to different destination are ignored. Broadcast messages are always received.  
CEC\_FULL\_LISTENING\_MODE: CEC peripheral receives messages addressed to its own address (OAR) with positive acknowledge. Messages addressed to different destination are received, but without interfering with the CEC bus: no acknowledge sent.
- ***uint16\_t CEC\_InitTypeDef::OwnAddress***  
Own addresses configuration This parameter can be a value of  
***CEC\_OWN\_ADDRESS***
- ***uint8\_t\* CEC\_InitTypeDef::RxBuffer***  
CEC Rx buffer pointeur

## 9.1.2 CEC\_HandleTypeDef

### Data Fields

- ***CEC\_TypeDef \* Instance***
- ***CEC\_InitTypeDef Init***
- ***uint8\_t \* pTxBuffPtr***
- ***uint16\_t TxXferCount***
- ***uint16\_t RxXferSize***
- ***HAL\_LockTypeDef Lock***
- ***HAL\_CEC\_StateTypeDef gState***
- ***HAL\_CEC\_StateTypeDef RxState***
- ***uint32\_t ErrorCode***

### Field Documentation

- ***CEC\_TypeDef\* CEC\_HandleTypeDef::Instance***  
CEC registers base address
- ***CEC\_InitTypeDef CEC\_HandleTypeDef::Init***  
CEC communication parameters
- ***uint8\_t\* CEC\_HandleTypeDef::pTxBuffPtr***  
Pointer to CEC Tx transfer Buffer
- ***uint16\_t CEC\_HandleTypeDef::TxXferCount***  
CEC Tx Transfer Counter
- ***uint16\_t CEC\_HandleTypeDef::RxXferSize***  
CEC Rx Transfer size, 0: header received only
- ***HAL\_LockTypeDef CEC\_HandleTypeDef::Lock***  
Locking object
- ***HAL\_CEC\_StateTypeDef CEC\_HandleTypeDef::gState***  
CEC state information related to global Handle management and also related to Tx operations. This parameter can be a value of ***HAL\_CEC\_StateTypeDef***
- ***HAL\_CEC\_StateTypeDef CEC\_HandleTypeDef::RxState***  
CEC state information related to Rx operations. This parameter can be a value of ***HAL\_CEC\_StateTypeDef***

- ***uint32\_t CEC\_HandleTypeDef::ErrorCode***  
For errors handling purposes, copy of ISR register in case error is reported

## 9.2 CEC Firmware driver API description

### 9.2.1 How to use this driver

The specific CEC interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros \_\_HAL\_CEC\_ENABLE\_IT() and \_\_HAL\_CEC\_DISABLE\_IT() inside the transmit and receive process. (#) Program the Signal Free Time (SFT) and SFT option, Tolerance, reception stop in in case of Bit Rising Error, Error-Bit generation conditions, device logical address and Listen mode in the hcec Init structure. (#) Initialize the CEC registers by calling the HAL\_CEC\_Init() API.

This API (HAL\_CEC\_Init()) configures also the low level Hardware GPIO, CLOCK, CORTEX...etc by calling the customized HAL\_CEC\_MspInit() API.

### 9.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the CEC

- The following parameters need to be configured:
  - SignalFreeTime
  - Tolerance
  - BRERxStop (RX stopped or not upon Bit Rising Error)
  - BREErrorBitGen (Error-Bit generation in case of Bit Rising Error)
  - LBPEErrorBitGen (Error-Bit generation in case of Long Bit Period Error)
  - BroadcastMsgNoErrorBitGen (Error-bit generation in case of broadcast message error)
  - SignalFreeTimeOption (SFT Timer start definition)
  - OwnAddress (CEC device address)
  - ListenMode

This section contains the following APIs:

- [\*\*HAL\\_CEC\\_Init\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_DelInit\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_SetDeviceAddress\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_MspDelInit\(\)\*\*](#)

### 9.2.3 IO operation functions

This section contains the following APIs:

- [\*\*HAL\\_CEC\\_Transmit\\_IT\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_GetLastReceivedFrameSize\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_ChangeRxBuffer\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_IRQHandler\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_TxCpltCallback\(\)\*\*](#)
- [\*\*HAL\\_CEC\\_RxCpltCallback\(\)\*\*](#)

- [\*HAL\\_CEC\\_ErrorCallback\(\)\*](#)

## 9.2.4 Peripheral Control function

This subsection provides a set of functions allowing to control the CEC.

- HAL\_CEC\_GetState() API can be helpful to check in run-time the state of the CEC peripheral.
- HAL\_CEC\_GetError() API can be helpful to check in run-time the error of the CEC peripheral.

This section contains the following APIs:

- [\*HAL\\_CEC\\_GetState\(\)\*](#)
- [\*HAL\\_CEC\\_GetError\(\)\*](#)

## 9.2.5 Detailed description of functions

### **HAL\_CEC\_Init**

|                      |                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CEC_Init (CEC_HandleTypeDef * hcec)</b>                                                          |
| Function description | Initializes the CEC mode according to the specified parameters in the CEC_InitTypeDef and creates the associated handle . |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> CEC handle</li> </ul>                                               |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                    |

### **HAL\_CEC\_DelInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CEC_DelInit (CEC_HandleTypeDef * hcec)</b>         |
| Function description | Delinitializes the CEC peripheral.                                          |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> CEC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>      |

### **HAL\_CEC\_SetDeviceAddress**

|                      |                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CEC_SetDeviceAddress (CEC_HandleTypeDef * hcec, uint16_t CEC_OwnAddress)</b>                              |
| Function description | Initializes the Own Address of the CEC device.                                                                                     |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> CEC handle</li> <li>• <b>CEC_OwnAddress:</b> The CEC own address.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                             |

### **HAL\_CEC\_MspInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_CEC_MspInit (CEC_HandleTypeDef * hcec)</b>                      |
| Function description | CEC MSP Init.                                                               |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> CEC handle</li> </ul> |

|               |                                                               |
|---------------|---------------------------------------------------------------|
| Return values | <ul style="list-style-type: none"><li>• <b>None</b></li></ul> |
|---------------|---------------------------------------------------------------|

### HAL\_CEC\_MspDelInit

Function name      **void HAL\_CEC\_MspDelInit (CEC\_HandleTypeDef \* hcec)**

Function description      CEC MSP DelInit.

Parameters      

- **hcec:** CEC handle

Return values      

- **None**

### HAL\_CEC\_Transmit\_IT

Function name      **HAL\_StatusTypeDef HAL\_CEC\_Transmit\_IT  
(CEC\_HandleTypeDef \* hcec, uint8\_t InitiatorAddress, uint8\_t  
DestinationAddress, uint8\_t \* pData, uint32\_t Size)**

Function description      Send data in interrupt mode.

Parameters      

- **hcec:** CEC handle
- **InitiatorAddress:** Initiator address
- **DestinationAddress:** destination logical address
- **pData:** pointer to input byte data buffer
- **Size:** amount of data to be sent in bytes (without counting the header). 0 means only the header is sent (ping operation). Maximum TX size is 15 bytes (1 opcode and up to 14 operands).

Return values      

- **HAL:** status

### HAL\_CEC\_GetLastReceivedFrameSize

Function name      **uint32\_t HAL\_CEC\_GetLastReceivedFrameSize  
(CEC\_HandleTypeDef \* hcec)**

Function description      Get size of the received frame.

Parameters      

- **hcec:** CEC handle

Return values      

- **Frame:** size

### HAL\_CEC\_ChangeRxBuffer

Function name      **void HAL\_CEC\_ChangeRxBuffer (CEC\_HandleTypeDef \* hcec,  
uint8\_t \* Rxbuffer)**

Function description      Change Rx Buffer.

Parameters      

- **hcec:** CEC handle
- **Rxbuffer:** Rx Buffer

Return values      

- **Frame:** size

Notes      

- This function can be called only inside the HAL\_CEC\_RxCpltCallback()

**HAL\_CEC\_IRQHandler**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_CEC_IRQHandler (CEC_HandleTypeDef * hcec)</b>                   |
| Function description | This function handles CEC interrupt requests.                               |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> CEC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_CEC\_TxCpltCallback**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_CEC_TxCpltCallback (CEC_HandleTypeDef * hcec)</b>               |
| Function description | Tx Transfer completed callback.                                             |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> CEC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_CEC\_RxCpltCallback**

|                      |                                                                                                                          |

| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> pointer to a CEC_HandleTypeDef structure that contains the configuration information for the specified CEC module.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> state</li> </ul>                                                                                                               |

**HAL\_CEC\_GetError**

|                      |                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------|
| Function name        | <b>uint32_t HAL_CEC_GetError (CEC_HandleTypeDef * hcec)</b>                                                    |
| Function description | Return the CEC error code.                                                                                     |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcec:</b> pointer to a CEC_HandleTypeDef structure that</li> </ul> |

contains the configuration information for the specified CEC.

Return values

- **CEC:** Error Code

## 9.3 CEC Firmware driver defines

### 9.3.1 CEC

**CEC all RX or TX errors flags**

`CEC_ISR_ALL_ERROR`

**CEC Error Bit Generation if Bit Rise Error reported**

`CEC_BRE_ERRORBIT_NO_GENERATION`

`CEC_BRE_ERRORBIT_GENERATION`

**CEC Reception Stop on Error**

`CEC_NO_RX_STOP_ON_BRE`

`CEC_RX_STOP_ON_BRE`

**CEC Error Bit Generation on Broadcast message**

`CEC_BROADCASTERROR_ERRORBIT_GENERATION`

`CEC_BROADCASTERROR_NO_ERRORBIT_GENERATION`

**CEC Error Code**

`HAL_CEC_ERROR_NONE` no error

`HAL_CEC_ERROR_RXOVR` CEC Rx-Overrun

`HAL_CEC_ERROR_BRE` CEC Rx Bit Rising Error

`HAL_CEC_ERROR_SBPE` CEC Rx Short Bit period Error

`HAL_CEC_ERROR_LBPE` CEC Rx Long Bit period Error

`HAL_CEC_ERROR_RXACKE` CEC Rx Missing Acknowledge

`HAL_CEC_ERROR_ARBLST` CEC Arbitration Lost

`HAL_CEC_ERROR_TXUDR` CEC Tx-Buffer Underrun

`HAL_CEC_ERROR_TXERR` CEC Tx-Error

`HAL_CEC_ERROR_TXACKE` CEC Tx Missing Acknowledge

**CEC Exported Macros**

`_HAL_CEC_RESET_HANDLE_STATE`

**Description:**

- Reset CEC handle gstate & RxState.

**Parameters:**

- `_HANDLE_`: CEC handle.

**Return value:**

- None

**Description:**

- Checks whether or not the

`_HAL_CEC_GET_FLAG`

specified CEC interrupt flag is set.

**Parameters:**

- \_\_HANDLE\_\_: specifies the CEC Handle.
- \_\_FLAG\_\_: specifies the flag to check.
  - CEC\_FLAG\_TXACKE: Tx Missing acknowledge Error
  - CEC\_FLAG\_TXERR: Tx Error.
  - CEC\_FLAG\_RXUDR: Rx-Buffer Underrun.
  - CEC\_FLAG\_TXEND: End of transmission (successful transmission of the last byte).
  - CEC\_FLAG\_RXBR: Rx-Byte Request.
  - CEC\_FLAG\_ARBLST: Arbitration Lost
  - CEC\_FLAG\_RXACKE: Rx-Missing Acknowledge
  - CEC\_FLAG\_LBPE: Rx Long period Error
  - CEC\_FLAG\_SBPE: Rx Short period Error
  - CEC\_FLAG\_BRE: Rx Bit Rising Error
  - CEC\_FLAG\_RXOVR: Rx Overrun.
  - CEC\_FLAG\_RXEND: End Of Reception.
  - CEC\_FLAG\_RXBR: Rx-Byte Received.

**Return value:**

- ITStatus

[\\_\\_HAL\\_CEC\\_CLEAR\\_FLAG](#)

**Description:**

- Clears the interrupt or status flag when raised (write at 1U)

**Parameters:**

- \_\_HANDLE\_\_: specifies the CEC Handle.
- \_\_FLAG\_\_: specifies the interrupt/status flag to clear. This parameter can be one of the following values:
  - CEC\_FLAG\_TXACKE: Tx Missing acknowledge Error
  - CEC\_FLAG\_TXERR: Tx

- Error.
- CEC\_FLAG\_TXUDR: Tx-Buffer Underrun.
- CEC\_FLAG\_TXEND: End of transmission (successful transmission of the last byte).
- CEC\_FLAG\_RXBR: Rx-Byte Request.
- CEC\_FLAG\_ARBLST: Arbitration Lost
- CEC\_FLAG\_RXACKE: Rx-Missing Acknowledge
- CEC\_FLAG\_LBPE: Rx Long period Error
- CEC\_FLAG\_SBPE: Rx Short period Error
- CEC\_FLAG\_BRE: Rx Bit Rising Error
- CEC\_FLAG\_RXOVR: Rx Overrun.
- CEC\_FLAG\_RXEND: End Of Reception.
- CEC\_FLAG\_RXBR: Rx-Byte Received.

**Return value:**

- none

**\_HAL\_CEC\_ENABLE\_IT****Description:**

- Enables the specified CEC interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the CEC Handle.
- \_\_INTERRUPT\_\_: specifies the CEC interrupt to enable. This parameter can be one of the following values:
  - CEC\_IT\_RXACKE: Rx-Missing acknowledge Error IT Enable
  - CEC\_IT\_TXERR: Tx Error IT Enable
  - CEC\_IT\_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC\_IT\_TXEND: End of transmission IT Enable
  - CEC\_IT\_RXBR: Rx-Byte Request IT Enable
  - CEC\_IT\_ARBLST: Arbitration Lost IT Enable
  - CEC\_IT\_RXACKE: Rx-Missing acknowledge Error IT Enable

- Missing Acknowledge IT Enable
- CEC\_IT\_LBPE: Rx Long period Error IT Enable
- CEC\_IT\_SBPE: Rx Short period Error IT Enable
- CEC\_IT\_BRE: Rx Bit Rising Error IT Enable
- CEC\_IT\_RXOVR: Rx Overrun IT Enable
- CEC\_IT\_RXEND: End Of Reception IT Enable
- CEC\_IT\_RXBR: Rx-Byte Received IT Enable

**Return value:**

- none

**\_HAL\_CEC\_DISABLE\_IT****Description:**

- Disables the specified CEC interrupt.

**Parameters:**

- \_HANDLE\_: specifies the CEC Handle.
- \_INTERRUPT\_: specifies the CEC interrupt to disable. This parameter can be one of the following values:
  - CEC\_IT\_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC\_IT\_TXERR: Tx Error IT Enable
  - CEC\_IT\_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC\_IT\_TXEND: End of transmission IT Enable
  - CEC\_IT\_TXBR: Tx-Byte Request IT Enable
  - CEC\_IT\_ARBLST: Arbitration Lost IT Enable
  - CEC\_IT\_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC\_IT\_LBPE: Rx Long period Error IT Enable
  - CEC\_IT\_SBPE: Rx Short period Error IT Enable
  - CEC\_IT\_BRE: Rx Bit Rising Error IT Enable
  - CEC\_IT\_RXOVR: Rx Overrun IT Enable
  - CEC\_IT\_RXEND: End Of

- Reception IT Enable
- CEC\_IT\_RXBR: Rx-Byte Received IT Enable

**Return value:**

- none

**\_HAL\_CEC\_GET\_IT\_SOURCE****Description:**

- Checks whether or not the specified CEC interrupt is enabled.

**Parameters:**

- \_\_HANDLE\_\_: specifies the CEC Handle.
- \_\_INTERRUPT\_\_: specifies the CEC interrupt to check. This parameter can be one of the following values:
  - CEC\_IT\_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC\_IT\_TXERR: Tx Error IT Enable
  - CEC\_IT\_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC\_IT\_TXEND: End of transmission IT Enable
  - CEC\_IT\_TXBR: Tx-Byte Request IT Enable
  - CEC\_IT\_ARBLST: Arbitration Lost IT Enable
  - CEC\_IT\_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC\_IT\_LBPE: Rx Long period Error IT Enable
  - CEC\_IT\_SBPE: Rx Short period Error IT Enable
  - CEC\_IT\_BRE: Rx Bit Rising Error IT Enable
  - CEC\_IT\_RXOVR: Rx Overrun IT Enable
  - CEC\_IT\_RXEND: End Of Reception IT Enable
  - CEC\_IT\_RXBR: Rx-Byte Received IT Enable

**Return value:**

- FlagStatus

**\_HAL\_CEC\_ENABLE****Description:**

- Enables the CEC device.

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.

**Return value:**

- none

`__HAL_CEC_DISABLE`

**Description:**

- Disables the CEC device.

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.

**Return value:**

- none

`__HAL_CEC_FIRST_BYTE_TX_SET`

**Description:**

- Set Transmission Start flag.

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.

**Return value:**

- none

`__HAL_CEC_LAST_BYTE_TX_SET`

**Description:**

- Set Transmission End flag.

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.

**Return value:**

- None If the CEC message consists of only one byte, TXEOM must be set before of TXSOM.

`__HAL_CEC_GET_TRANSMISSION_START_FLAG`

**Description:**

- Get Transmission Start flag.

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.

**Return value:**

- FlagStatus

`__HAL_CEC_GET_TRANSMISSION_END_FLAG`

**Description:**

- Get Transmission End flag.

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.

**Return value:**

- `FlagStatus`

**Description:**

- Clear OAR register.

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.

**Return value:**

- `none`

**Description:**

- Set OAR register (without resetting previously set address in case of multi-address mode)  
To reset OAR,

**Parameters:**

- `__HANDLE__`: specifies the CEC Handle.
- `__ADDRESS__`: Own Address value (CEC logical address is identified by bit position)

**Return value:**

- `none`

## 10 HAL COMP Generic Driver

### 10.1 COMP Firmware driver registers structures

#### 10.1.1 COMP\_InitTypeDef

##### Data Fields

- *uint32\_t InvertingInput*
- *uint32\_t NonInvertingInput*
- *uint32\_t Output*
- *uint32\_t OutputPol*
- *uint32\_t Hysteresis*
- *uint32\_t BlankingSrce*
- *uint32\_t Mode*
- *uint32\_t WindowMode*
- *uint32\_t TriggerMode*

##### Field Documentation

- ***uint32\_t COMP\_InitTypeDef::InvertingInput***  
Selects the inverting input of the comparator. This parameter can be a value of [\*\*COMPEx\\_InvertingInput\*\*](#)
- ***uint32\_t COMP\_InitTypeDef::NonInvertingInput***  
Selects the non inverting input of the comparator. This parameter can be a value of [\*\*COMPEx\\_NonInvertingInput\*\*](#) Note: Only available on STM32F302xB/xC, STM32F303xB/xC and STM32F358xx devices
- ***uint32\_t COMP\_InitTypeDef::Output***  
Selects the output redirection of the comparator. This parameter can be a value of [\*\*COMPEx\\_Output\*\*](#)
- ***uint32\_t COMP\_InitTypeDef::OutputPol***  
Selects the output polarity of the comparator. This parameter can be a value of [\*\*COMP\\_OutputPolarity\*\*](#)
- ***uint32\_t COMP\_InitTypeDef::Hysteresis***  
Selects the hysteresis voltage of the comparator. This parameter can be a value of [\*\*COMPEx\\_Hysteresis\*\*](#) Note: Only available on STM32F302xB/xC, STM32F303xB/xC, STM32F373xB/xC, STM32F358xx and STM32F378xx devices
- ***uint32\_t COMP\_InitTypeDef::BlankingSrce***  
Selects the output blanking source of the comparator. This parameter can be a value of [\*\*COMPEx\\_BlinkingSrce\*\*](#) Note: Not available on STM32F373xB/C and STM32F378xx devices
- ***uint32\_t COMP\_InitTypeDef::Mode***  
Selects the operating consumption mode of the comparator to adjust the speed/consumption. This parameter can be a value of [\*\*COMPEx\\_Mode\*\*](#) Note: Not available on STM32F301x6/x8, STM32F302x6/x8, STM32F334x6/x8, STM32F318xx and STM32F328xx devices
- ***uint32\_t COMP\_InitTypeDef::WindowMode***  
Selects the window mode of the comparator X (X=2U, 4 or 6 if available). This parameter can be a value of [\*\*COMPEx\\_WindowMode\*\*](#)
- ***uint32\_t COMP\_InitTypeDef::TriggerMode***  
Selects the trigger mode of the comparator (interrupt mode). This parameter can be a value of [\*\*COMP\\_TriggerMode\*\*](#)

## 10.2 COMP Firmware driver API description

### 10.2.1 COMP Peripheral features

The STM32F3xx device family integrates up to 7 analog comparators COMP1, COMP2...COMP7:

1. The non inverting input and inverting input can be set to GPIO pins. For STM32F3xx devices please refer to the COMP peripheral section in corresponding Reference Manual.
2. The COMP output is available using HAL\_COMP\_GetOutputLevel() and can be set on GPIO pins. For STM32F3xx devices please refer to the COMP peripheral section in corresponding Reference Manual.
3. The COMP output can be redirected to embedded timers (TIM1, TIM2, TIM3...). For STM32F3xx devices please refer to the COMP peripheral section in corresponding Reference Manual.
4. Each couple of comparators COMP1 and COMP2, COMP3 and COMP4, COMP5 and COMP6 can be combined in window mode and respectively COMP1, COMP3 and COMP5 non inverting input is used as common non-inverting input.
5. The seven comparators have interrupt capability with wake-up from Sleep and Stop modes (through the EXTI controller):
  - COMP1 is internally connected to EXTI Line 21
  - COMP2 is internally connected to EXTI Line 22
  - COMP3 is internally connected to EXTI Line 29
  - COMP4 is internally connected to EXTI Line 30
  - COMP5 is internally connected to EXTI Line 31
  - COMP6 is internally connected to EXTI Line 32
  - COMP7 is internally connected to EXTI Line 33. From the corresponding IRQ handler, the right interrupt source can be retrieved with the adequate macro `__HAL_COMP_COMPx_EXTI_GET_FLAG()`.

### 10.2.2 How to use this driver

This driver provides functions to configure and program the Comparators of all STM32F3xx devices. To use the comparator, perform the following steps:

1. Fill in the HAL\_COMP\_MspInit() to
  - Configure the comparator input in analog mode using HAL\_GPIO\_Init()

- Configure the comparator output in alternate function mode using HAL\_GPIO\_Init() to map the comparator output to the GPIO pin
  - If required enable the COMP interrupt (EXTI line Interrupt): by configuring and enabling EXTI line in Interrupt mode and selecting the desired sensitivity level using HAL\_GPIO\_Init() function. After that enable the comparator interrupt vector using HAL\_NVIC\_SetPriority() and HAL\_NVIC\_EnableIRQ() functions.
2. Configure the comparator using HAL\_COMP\_Init() function:
    - Select the inverting input (input minus)
    - Select the non-inverting input (input plus)
    - Select the output polarity
    - Select the output redirection
    - Select the hysteresis level
    - Select the power mode
    - Select the event/interrupt mode HAL\_COMP\_Init() calls internally \_\_HAL\_RCC\_SYSCFG\_CLK\_ENABLE() in order to enable the comparator(s).
  3. On-the-fly reconfiguration of comparator(s) may be done by calling again HAL\_COMP\_Init() function with new input parameter values; HAL\_COMP\_MspInit() function shall be adapted to support multi configurations.
  4. Enable the comparator using HAL\_COMP\_Start() or HAL\_COMP\_Start\_IT() functions.
  5. Use HAL\_COMP\_TriggerCallback() and/or HAL\_COMP\_GetOutputLevel() functions to manage comparator outputs (events and output level).
  6. Disable the comparator using HAL\_COMP\_Stop() or HAL\_COMP\_Stop\_IT() function.
  7. De-initialize the comparator using HAL\_COMP\_DelInit() function.
  8. For safety purposes comparator(s) can be locked using HAL\_COMP\_Lock() function. Only a MCU reset can reset that protection.

### 10.2.3 Initialization and de-initialization functions

This section provides functions to initialize and de-initialize comparators.

This section contains the following APIs:

- [\*\*HAL\\_COMP\\_Init\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_DelInit\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_MspDelInit\(\)\*\*](#)

### 10.2.4 Start Stop operation functions

This section provides functions allowing to:

- Start a comparator without interrupt generation.
- Stop a comparator without interrupt generation.
- Start a comparator with interrupt generation.
- Stop a comparator with interrupt generation.
- Handle interrupts from a comparator with associated callback function.

This section contains the following APIs:

- [\*\*HAL\\_COMP\\_Start\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_Stop\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_Start\\_IT\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_Stop\\_IT\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_IRQHandler\(\)\*\*](#)
- [\*\*HAL\\_COMP\\_TriggerCallback\(\)\*\*](#)

### 10.2.5 Peripheral Control functions

This subsection provides a set of functions allowing to control the comparators.

This section contains the following APIs:

- [\*HAL\\_COMP\\_Lock\(\)\*](#)
- [\*HAL\\_COMP\\_GetOutputLevel\(\)\*](#)

### 10.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- [\*HAL\\_COMP\\_GetState\(\)\*](#)

### 10.2.7 Detailed description of functions

#### **HAL\_COMP\_Init**

|                      |                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_COMP_Init (COMP_HandleTypeDef * hcomp)</b>                                                                                                                |
| Function description | Initialize the COMP peripheral according to the specified parameters in the COMP_InitTypeDef and initialize the associated handle.                                                 |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcomp:</b> COMP handle</li> </ul>                                                                                                      |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                             |
| Notes                | <ul style="list-style-type: none"> <li>• If the selected comparator is locked, initialization cannot be performed. To unlock the configuration, perform a system reset.</li> </ul> |

#### **HAL\_COMP\_DelInit**

|                      |                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_COMP_DelInit (COMP_HandleTypeDef * hcomp)</b>                                                                                                               |
| Function description | Deinitialize the COMP peripheral.                                                                                                                                                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcomp:</b> COMP handle</li> </ul>                                                                                                        |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                               |
| Notes                | <ul style="list-style-type: none"> <li>• If the selected comparator is locked, deinitialization cannot be performed. To unlock the configuration, perform a system reset.</li> </ul> |

#### **HAL\_COMP\_MspInit**

|                      |                                                                               |
|----------------------|-------------------------------------------------------------------------------|
| Function name        | <b>void HAL_COMP_MspInit (COMP_HandleTypeDef * hcomp)</b>                     |
| Function description | Initialize the COMP MSP.                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcomp:</b> COMP handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>               |

**HAL\_COMP\_MspDeInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_COMP_MspDeInit (COMP_HandleTypeDef * hcomp)</b>                 |
| Function description | DeInitialize the COMP MSP.                                                  |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>               |

**HAL\_COMP\_Start**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_COMP_Start (COMP_HandleTypeDef * hcomp)</b>        |
| Function description | Start the comparator.                                                       |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>        |

**HAL\_COMP\_Stop**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_COMP_Stop (COMP_HandleTypeDef * hcomp)</b>         |
| Function description | Stop the comparator.                                                        |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>        |

**HAL\_COMP\_Start\_IT**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_COMP_Start_IT (COMP_HandleTypeDef * hcomp)</b>     |
| Function description | Start the comparator in Interrupt mode.                                     |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status.</li></ul>       |

**HAL\_COMP\_Stop\_IT**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_COMP_Stop_IT (COMP_HandleTypeDef * hcomp)</b>      |
| Function description | Stop the comparator in Interrupt mode.                                      |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>        |

### HAL\_COMP\_IRQHandler

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_COMP_IRQHandler (COMP_HandleTypeDef * hcomp)</b>                |
| Function description | Comparator IRQ Handler.                                                     |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>        |

### HAL\_COMP\_TriggerCallback

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_COMP_TriggerCallback (COMP_HandleTypeDef * hcomp)</b>           |
| Function description | Comparator callback.                                                        |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>               |

### HAL\_COMP\_Lock

|                      |                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_COMP_Lock (COMP_HandleTypeDef * hcomp)</b>                                                  |
| Function description | Lock the selected comparator configuration.                                                                          |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul>                                          |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>                                                 |
| Notes                | <ul style="list-style-type: none"><li>• A system reset is required to unlock the comparator configuration.</li></ul> |

### HAL\_COMP\_GetOutputLevel

|                      |                                                                      |
|----------------------|----------------------------------------------------------------------|
| Function name        | <b>uint32_t HAL_COMP_GetOutputLevel (COMP_HandleTypeDef * hcomp)</b> |
| Function description | Return the output level (high or low) of the selected comparator.    |

### HAL\_COMP\_GetState

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_COMP_StateTypeDef HAL_COMP_GetState (COMP_HandleTypeDef * hcomp)</b> |
| Function description | Return the COMP handle state.                                               |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcomp:</b> COMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> state</li></ul>         |

## 10.3 COMP Firmware driver defines

### 10.3.1 COMP

#### **COMP Exported Macros**

|                                           |                                                                                         |
|-------------------------------------------|-----------------------------------------------------------------------------------------|
| <code>_HAL_COMP_RESET_HANDLE_STATE</code> | <b>Description:</b>                                                                     |
|                                           | <ul style="list-style-type: none"> <li>• Reset COMP handle state.</li> </ul>            |
|                                           | <b>Parameters:</b>                                                                      |
|                                           | <ul style="list-style-type: none"> <li>• <code>_HANDLE_</code>: COMP handle.</li> </ul> |
|                                           | <b>Return value:</b>                                                                    |
|                                           | <ul style="list-style-type: none"> <li>• None</li> </ul>                                |

#### **COMP Flag**

`COMP_FLAG_LOCK` Lock flag

**COMP Extended Private macro to get the EXTI line associated with a comparator handle**

|                                 |                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>COMP_GET_EXTI_LINE</code> | <b>Description:</b>                                                                                        |
|                                 | <ul style="list-style-type: none"> <li>• Get the specified EXTI line for a comparator instance.</li> </ul> |
|                                 | <b>Parameters:</b>                                                                                         |
|                                 | <ul style="list-style-type: none"> <li>• <code>_INSTANCE_</code>: specifies the COMP instance.</li> </ul>  |
|                                 | <b>Return value:</b>                                                                                       |
|                                 | <ul style="list-style-type: none"> <li>• value: of</li> </ul>                                              |

**COMP Private macros to check input parameters**

`IS_COMP_OUTPUTPOL`

`IS_COMP_TRIGGERMODE`

#### **COMP Output Level**

`COMP_OUTPUTLEVEL_LOW`

`COMP_OUTPUTLEVEL_HIGH`

#### **COMP Output Polarity**

`COMP_OUTPUTPOL_NONINVERTED` COMP output on GPIO isn't inverted

`COMP_OUTPUTPOL_INVERTED` COMP output on GPIO is inverted

#### **COMP State Lock**

`COMP_STATE_BIT_LOCK`

#### **COMP Trigger Mode**

|                                    |                                         |
|------------------------------------|-----------------------------------------|
| <code>COMP_TRIGGERMODE_NONE</code> | No External Interrupt trigger detection |
|------------------------------------|-----------------------------------------|

|                                         |                                                            |
|-----------------------------------------|------------------------------------------------------------|
| <code>COMP_TRIGGERMODE_IT_RISING</code> | External Interrupt Mode with Rising edge trigger detection |
|-----------------------------------------|------------------------------------------------------------|

|                                          |                                                             |
|------------------------------------------|-------------------------------------------------------------|
| <code>COMP_TRIGGERMODE_IT_FALLING</code> | External Interrupt Mode with Falling edge trigger detection |
|------------------------------------------|-------------------------------------------------------------|

|                                       |                                                                    |
|---------------------------------------|--------------------------------------------------------------------|
| COMP_TRIGGERMODE_IT_RISING_FALLING    | External Interrupt Mode with Rising/Falling edge trigger detection |
| COMP_TRIGGERMODE_EVENT_RISING         | Event Mode with Rising edge trigger detection                      |
| COMP_TRIGGERMODE_EVENT_FALLING        | Event Mode with Falling edge trigger detection                     |
| COMP_TRIGGERMODE_EVENT_RISING_FALLING | Event Mode with Rising/Falling edge trigger detection              |

## 11 HAL COMP Extension Driver

### 11.1 COMPEx Firmware driver defines

#### 11.1.1 COMPEx

***COMP Extended Blanking Source  
(STM32F303xE/STM32F398xx/STM32F303xC/STM32F358xx Product devices)***

|                            |                                                                        |
|----------------------------|------------------------------------------------------------------------|
| COMP_BLANKINGSRCE_NONE     | No blanking source                                                     |
| COMP_BLANKINGSRCE_TIM1OC5  | TIM1 OC5 selected as blanking source for COMP1, COMP2, COMP3 and COMP7 |

***COMP Extended Exported Macros***

`_HAL_COMP_ENABLE`

**Description:**

- Enable the specified comparator.

**Parameters:**

- `_HANDLE_`: COMP handle.

**Return value:**

- None

`_HAL_COMP_DISABLE`

**Description:**

- Disable the specified comparator.

**Parameters:**

- `_HANDLE_`: COMP handle.

**Return value:**

- None

`__HAL_COMP_LOCK`

**Description:**

- Lock a comparator instance.

**Parameters:**

- `__HANDLE__`: COMP handle

**Return value:**

- None.

`__HAL_COMP_GET_FLAG`

**Description:**

- Check whether the specified COMP flag is set or not.

**Parameters:**

- `__HANDLE__`: COMP Handle.
- `__FLAG__`: flag to check.  
This parameter can be one of the following values:
  - `COMP_FLAG_LOCK`  
lock flag

**Return value:**

- The new state of `__FLAG__` (TRUE or FALSE).

`__HAL_COMP_COMP1_EXTI_ENABLE_RISING_EDGE`

**Description:**

- Enable the COMP1 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_DISABLE_RISING_EDGE`

**Description:**

- Disable the COMP1 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_ENABLE_FALLING_EDGE`

**Description:**

- Enable the COMP1 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_DISABLE_FALLING_EDGE`

**Description:**

- Disable the COMP1 EXTI line falling edge trigger.

**Return value:**

- None

---

`__HAL_COMP_COMP1_EXTI_ENABLE_RISING_FALLING_EDGE`

**Description:**

- Enable the COMP1 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_DISABLE_RISING_FALLING_EDGE`

**Description:**

- Disable the COMP1 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_ENABLE_IT`

**Description:**

- Enable the COMP1 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_DISABLE_IT`

**Description:**

- Disable the COMP1 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_GENERATE_SWIT`

**Description:**

- Generate a software interrupt on the COMP1 EXTI line.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_ENABLE_EVENT`

**Description:**

- Enable the COMP1 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_DISABLE_EVENT`

**Description:**

- Disable the COMP1 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP1_EXTI_GET_FLAG`

**Description:**

- Check whether the COMP1 EXTI line flag is set or not.

`__HAL_COMP_COMP1_EXTI_CLEAR_FLAG`

**Return value:**

- RESET: or SET

**Description:**

- Clear the COMP1 EXTI flag.

**Return value:**

- None

**Description:**

- Enable the COMP2 EXTI line rising edge trigger.

**Return value:**

- None

**Description:**

- Disable the COMP2 EXTI line rising edge trigger.

**Return value:**

- None

**Description:**

- Enable the COMP2 EXTI line falling edge trigger.

**Return value:**

- None

**Description:**

- Disable the COMP2 EXTI line falling edge trigger.

**Return value:**

- None

**Description:**

- Enable the COMP2 EXTI line rising & falling edge trigger.

**Return value:**

- None

**Description:**

- Disable the COMP2 EXTI line rising & falling edge trigger.

**Return value:**

- None

**Description:**

- Enable the COMP2 EXTI line

in interrupt mode.

**Return value:**

- None

**Description:**

- Disable the COMP2 EXTI line in interrupt mode.

**Return value:**

- None

**Description:**

- Generate a software interrupt on the COMP2 EXTI line.

**Return value:**

- None

**Description:**

- Enable the COMP2 EXTI line in event mode.

**Return value:**

- None

**Description:**

- Disable the COMP2 EXTI line in event mode.

**Return value:**

- None

**Description:**

- Check whether the COMP2 EXTI line flag is set or not.

**Return value:**

- RESET: or SET

**Description:**

- Clear the COMP2 EXTI flag.

**Return value:**

- None

**Description:**

- Enable the COMP3 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_DISABLE_RISING_EDGE`

**Description:**

- Disable the COMP3 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_ENABLE_FALLING_EDGE`

**Description:**

- Enable the COMP3 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_DISABLE_FALLING_EDGE`

**Description:**

- Disable the COMP3 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_ENABLE_RISING_FALLING_EDGE`

**Description:**

- Enable the COMP3 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_DISABLE_RISING_FALLING_EDGE`

**Description:**

- Disable the COMP3 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_ENABLE_IT`

**Description:**

- Enable the COMP3 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_DISABLE_IT`

**Description:**

- Disable the COMP3 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP3_EXTI_GENERATE_SWIT`

**Description:**

- Generate a software interrupt on the COMP3 EXTI line.

**Return value:**

- None

**Description:**

- Enable the COMP3 EXTI line in event mode.

**Return value:**

- None

**Description:**

- Disable the COMP3 EXTI line in event mode.

**Return value:**

- None

**Description:**

- Check whether the COMP3 EXTI line flag is set or not.

**Return value:**

- RESET: or SET

**Description:**

- Clear the COMP3 EXTI flag.

**Return value:**

- None

**Description:**

- Enable the COMP4 EXTI line rising edge trigger.

**Return value:**

- None

**Description:**

- Disable the COMP4 EXTI line rising edge trigger.

**Return value:**

- None

**Description:**

- Enable the COMP4 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_DISABLE_FALLING_EDGE`

**Description:**

- Disable the COMP4 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_ENABLE_RISING_FALLING_EDGE`

**Description:**

- Enable the COMP4 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_DISABLE_RISING_FALLING_EDGE`

**Description:**

- Disable the COMP4 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_ENABLE_IT`

**Description:**

- Enable the COMP4 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_DISABLE_IT`

**Description:**

- Disable the COMP4 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_GENERATE_SWIT`

**Description:**

- Generate a software interrupt on the COMP4 EXTI line.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_ENABLE_EVENT`

**Description:**

- Enable the COMP4 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP4_EXTI_DISABLE_EVENT`

**Description:**

- Disable the COMP4 EXTI line in event mode.

**Return value:**

- None

**Description:**

- Check whether the COMP4 EXTI line flag is set or not.

**Return value:**

- RESET: or SET

**Description:**

- Clear the COMP4 EXTI flag.

**Return value:**

- None

**Description:**

- Enable the COMP5 EXTI line rising edge trigger.

**Return value:**

- None

**Description:**

- Disable the COMP5 EXTI line rising edge trigger.

**Return value:**

- None

**Description:**

- Enable the COMP5 EXTI line falling edge trigger.

**Return value:**

- None

**Description:**

- Disable the COMP5 EXTI line falling edge trigger.

**Return value:**

- None

**Description:**

- Enable the COMP5 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP5_EXTI_DISABLE_RISING_  
FALLING_EDGE`

**Description:**

- Disable the COMP5 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP5_EXTI_ENABLE_IT`

**Description:**

- Enable the COMP5 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP5_EXTI_DISABLE_IT`

**Description:**

- Disable the COMP5 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP5_EXTI_GENERATE_SWIT`

**Description:**

- Generate a software interrupt on the COMP5 EXTI line.

**Return value:**

- None

`__HAL_COMP_COMP5_EXTI_ENABLE_EVENT`

**Description:**

- Enable the COMP5 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP5_EXTI_DISABLE_EVENT`

**Description:**

- Disable the COMP5 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP5_EXTI_GET_FLAG`

**Description:**

- Check whether the COMP5 EXTI line flag is set or not.

**Return value:**

- RESET: or SET

`__HAL_COMP_COMP5_EXTI_CLEAR_FLAG`**Description:**

- Clear the COMP5 EXTI flag.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_ENABLE_RISING_EDGE`**Description:**

- Enable the COMP6 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_DISABLE_RISING_EDGE`**Description:**

- Disable the COMP6 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_ENABLE_FALLING_EDGE`**Description:**

- Enable the COMP6 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_DISABLE_FALLING_EDGE`**Description:**

- Disable the COMP6 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_ENABLE_RISING_FALLING_EDGE`**Description:**

- Enable the COMP6 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_DISABLE_RISING_FALLING_EDGE`**Description:**

- Disable the COMP6 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_ENABLE_IT`**Description:**

- Enable the COMP6 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_DISABLE_IT`**Description:**

- Disable the COMP6 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_GENERATE_SWIT`**Description:**

- Generate a software interrupt on the COMP6 EXTI line.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_ENABLE_EVENT`**Description:**

- Enable the COMP6 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_DISABLE_EVENT`**Description:**

- Disable the COMP6 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP6_EXTI_GET_FLAG`**Description:**

- Check whether the COMP6 EXTI line flag is set or not.

**Return value:**

- RESET: or SET

`__HAL_COMP_COMP6_EXTI_CLEAR_FLAG`**Description:**

- Clear the COMP6 EXTI flag.

**Return value:**

- None

---

`__HAL_COMP_COMP7_EXTI_ENABLE_RISING_EDGE`

**Description:**

- Enable the COMP7 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_DISABLE_RISING_EDGE`

**Description:**

- Disable the COMP7 EXTI line rising edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_ENABLE_FALLING_EDGE`

**Description:**

- Enable the COMP7 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_DISABLE_FALLING_EDGE`

**Description:**

- Disable the COMP7 EXTI line falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_ENABLE_RISING_FALLING_EDGE`

**Description:**

- Enable the COMP7 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_DISABLE_RISING_FALLING_EDGE`

**Description:**

- Disable the COMP7 EXTI line rising & falling edge trigger.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_ENABLE_IT`

**Description:**

- Enable the COMP7 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_DISABLE_IT`**Description:**

- Disable the COMP7 EXTI line in interrupt mode.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_GENERATE_SWIT`**Description:**

- Generate a software interrupt on the COMP7 EXTI line.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_ENABLE_EVENT`**Description:**

- Enable the COMP7 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_DISABLE_EVENT`**Description:**

- Disable the COMP7 EXTI line in event mode.

**Return value:**

- None

`__HAL_COMP_COMP7_EXTI_GET_FLAG`**Description:**

- Check whether the COMP7 EXTI line flag is set or not.

**Return value:**

- RESET: or SET

`__HAL_COMP_COMP7_EXTI_CLEAR_FLAG`**Description:**

- Clear the COMP7 EXTI flag.

**Return value:**

- None

## 12 HAL CORTEX Generic Driver

### 12.1 CORTEX Firmware driver registers structures

#### 12.1.1 MPU\_Region\_InitTypeDef

##### Data Fields

- *uint8\_t Enable*
- *uint8\_t Number*
- *uint32\_t BaseAddress*
- *uint8\_t Size*
- *uint8\_t SubRegionDisable*
- *uint8\_t TypeExtField*
- *uint8\_t AccessPermission*
- *uint8\_t DisableExec*
- *uint8\_t IsShareable*
- *uint8\_t IsCacheable*
- *uint8\_t IsBufferable*

##### Field Documentation

- ***uint8\_t MPU\_Region\_InitTypeDef::Enable***  
Specifies the status of the region. This parameter can be a value of [\*\*CORTEX MPU Region Enable\*\*](#)
- ***uint8\_t MPU\_Region\_InitTypeDef::Number***  
Specifies the number of the region to protect. This parameter can be a value of [\*\*CORTEX MPU Region Number\*\*](#)
- ***uint32\_t MPU\_Region\_InitTypeDef::BaseAddress***  
Specifies the base address of the region to protect.
- ***uint8\_t MPU\_Region\_InitTypeDef::Size***  
Specifies the size of the region to protect. This parameter can be a value of [\*\*CORTEX MPU Region Size\*\*](#)
- ***uint8\_t MPU\_Region\_InitTypeDef::SubRegionDisable***  
Specifies the number of the subregion protection to disable. This parameter must be a number between Min\_Data = 0x00 and Max\_Data = 0xFF
- ***uint8\_t MPU\_Region\_InitTypeDef::TypeExtField***  
Specifies the TEX field level. This parameter can be a value of [\*\*CORTEX MPU TEX Levels\*\*](#)
- ***uint8\_t MPU\_Region\_InitTypeDef::AccessPermission***  
Specifies the region access permission type. This parameter can be a value of [\*\*CORTEX MPU Region Permission Attributes\*\*](#)
- ***uint8\_t MPU\_Region\_InitTypeDef::DisableExec***  
Specifies the instruction access status. This parameter can be a value of [\*\*CORTEX MPU Instruction Access\*\*](#)
- ***uint8\_t MPU\_Region\_InitTypeDef::IsShareable***  
Specifies the shareability status of the protected region. This parameter can be a value of [\*\*CORTEX MPU Access Shareable\*\*](#)
- ***uint8\_t MPU\_Region\_InitTypeDef::IsCacheable***  
Specifies the cacheable status of the region protected. This parameter can be a value of [\*\*CORTEX MPU Access Cacheable\*\*](#)

- ***uint8\_t MPU\_Region\_InitTypeDef::IsBufferable***  
Specifies the bufferable status of the protected region. This parameter can be a value of **CORTEX\_MPUMemoryAccessBufferable**

## 12.2 CORTEX Firmware driver API description

### 12.2.1 How to use this driver

#### How to configure Interrupts using CORTEX HAL driver

This section provides functions allowing to configure the NVIC interrupts (IRQ). The Cortex-M4 exceptions are managed by CMSIS functions.

1. Configure the NVIC Priority Grouping using HAL\_NVIC\_SetPriorityGrouping() function
2. Configure the priority of the selected IRQ Channels using HAL\_NVIC\_SetPriority()
3. Enable the selected IRQ Channels using HAL\_NVIC\_EnableIRQ() When the NVIC\_PRIORITYGROUP\_0 is selected, IRQ pre-emption is no more possible. The pending IRQ priority will be managed only by the sub priority. IRQ priority order (sorted by highest to lowest priority): Lowest pre-emption priorityLowest sub priorityLowest hardware priority (IRQ number)

#### How to configure Systick using CORTEX HAL driver

Setup SysTick Timer for time base

- The HAL\_SYSTICK\_Config() function calls the SysTick\_Config() function which is a CMSIS function that:
  - Configures the SysTick Reload register with value passed as function parameter.
  - Configures the SysTick IRQ priority to the lowest value (0x0FU).
  - Resets the SysTick Counter register.
  - Configures the SysTick Counter clock source to be Core Clock Source (HCLK).
  - Enables the SysTick Interrupt.
  - Starts the SysTick Counter.
- You can change the SysTick Clock source to be HCLK\_Div8 by calling the macro \_\_HAL\_CORTEX\_SYSTICKCLK\_CONFIG(SYSTICK\_CLKSOURCE\_HCLK\_DIV8) just after the HAL\_SYSTICK\_Config() function call. The \_\_HAL\_CORTEX\_SYSTICKCLK\_CONFIG() macro is defined inside the stm32f3xx\_hal\_cortex.h file.
- You can change the SysTick IRQ priority by calling the HAL\_NVIC\_SetPriority(SysTick\_IRQn,...) function just after the HAL\_SYSTICK\_Config() function call. The HAL\_NVIC\_SetPriority() call the NVIC\_SetPriority() function which is a CMSIS function.
- To adjust the SysTick time base, use the following formula: Reload Value = SysTick Counter Clock (Hz) x Desired Time base (s)
  - Reload Value is the parameter to be passed for HAL\_SYSTICK\_Config() function
  - Reload Value should not exceed 0xFFFFFFF

### 12.2.2 Initialization and de-initialization functions

This section provides the CORTEX HAL driver functions allowing to configure Interrupts Systick functionalities

This section contains the following APIs:

- [\*HAL\\_NVIC\\_SetPriorityGrouping\(\)\*](#)
- [\*HAL\\_NVIC\\_SetPriority\(\)\*](#)
- [\*HAL\\_NVIC\\_EnableIRQ\(\)\*](#)
- [\*HAL\\_NVIC\\_DisableIRQ\(\)\*](#)
- [\*HAL\\_NVIC\\_SystemReset\(\)\*](#)
- [\*HAL\\_SYSTICK\\_Config\(\)\*](#)

### 12.2.3 Peripheral Control functions

This subsection provides a set of functions allowing to control the CORTEX (NVIC, SYSTICK, MPU) functionalities.

This section contains the following APIs:

- [\*HAL\\_MPU\\_Disable\(\)\*](#)
- [\*HAL\\_MPU\\_Enable\(\)\*](#)
- [\*HAL\\_MPU\\_ConfigRegion\(\)\*](#)
- [\*HAL\\_NVIC\\_GetPriorityGrouping\(\)\*](#)
- [\*HAL\\_NVIC\\_GetPriority\(\)\*](#)
- [\*HAL\\_NVIC\\_SetPendingIRQ\(\)\*](#)
- [\*HAL\\_NVIC\\_GetPendingIRQ\(\)\*](#)
- [\*HAL\\_NVIC\\_ClearPendingIRQ\(\)\*](#)
- [\*HAL\\_NVIC\\_GetActive\(\)\*](#)
- [\*HAL\\_SYSTICK\\_CLKSourceConfig\(\)\*](#)
- [\*HAL\\_SYSTICK\\_IRQHandler\(\)\*](#)
- [\*HAL\\_SYSTICK\\_Callback\(\)\*](#)

### 12.2.4 Detailed description of functions

#### **HAL\_NVIC\_SetPriorityGrouping**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Function name        | <b>uint32_t HAL_NVIC_GetActive (IRQn_Type IRQn)</b>                                                                                                                                                                                                                           |
| Function description | Gets active interrupt ( reads the active register in NVIC and returns the active bit).                                                                                                                                                                                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>IRQn:</b> External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32f3xxxx.h))</li> </ul> |

- Return values
- **status:** - 0 Interrupt status is not pending.  
– 1 Interrupt status is pending.

### **HAL\_SYSTICK\_CLKSourceConfig**

Function name **void HAL\_SYSTICK\_CLKSourceConfig (uint32\_t CLKSource)**

Function description Configures the SysTick clock source.

- Parameters
- **CLKSource:** specifies the SysTick clock source. This parameter can be one of the following values:
    - SYSTICK\_CLKSOURCE\_HCLK\_DIV8: AHB clock divided by 8 selected as SysTick clock source.
    - SYSTICK\_CLKSOURCE\_HCLK: AHB clock selected as SysTick clock source.

- Return values
- **None**

### **HAL\_SYSTICK\_IRQHandler**

Function name **void HAL\_SYSTICK\_IRQHandler (void )**

Function description This function handles SYSTICK interrupt request.

- Return values
- **None**

### **HAL\_SYSTICK\_Callback**

Function name **void HAL\_SYSTICK\_Callback (void )**

Function description SYSTICK callback.

- Return values
- **None**

### **HAL\_MPU\_Disable**

Function name **void HAL\_MPU\_Disable (void )**

Function description Disables the MPU also clears the HFNMIEA bit (ARM recommendation)

- Return values
- **None**

### **HAL\_MPU\_Enable**

Function name **void HAL\_MPU\_Enable (uint32\_t MPU\_Control)**

Function description Enables the MPU.

- Parameters
- **MPU\_Control:** Specifies the control mode of the MPU during hard fault, NMI, FAULTMASK and privileged access to the default memory This parameter can be one of the following values:
    - MPU\_HFNMI\_PRIVDEF\_NONE
    - MPU\_HARDFAULT\_NMI
    - MPU\_PRIVILEGED\_DEFAULT
    - MPU\_HFNMI\_PRIVDEF

- Return values
- **None**

## 13 HAL CRC Generic Driver

### 13.1 CRC Firmware driver registers structures

#### 13.1.1 CRC\_InitTypeDef

##### Data Fields

- *uint8\_t DefaultPolynomialUse*
- *uint8\_t DefaultInitValueUse*
- *uint32\_t GeneratingPolynomial*
- *uint32\_t CRCLength*
- *uint32\_t InitValue*
- *uint32\_t InputDataInversionMode*
- *uint32\_t OutputDataInversionMode*

##### Field Documentation

- ***uint8\_t CRC\_InitTypeDef::DefaultPolynomialUse***  
This parameter is a value of [CRC\\_Default\\_Polynomial](#) and indicates if default polynomial is used. If set to DEFAULT\_POLYNOMIAL\_ENABLE, resort to default  $X^{32}U + X^{26}U + X^{23}U + X^{22}U + X^{16}U + X^{12}U + X^{11}U + X^{10}U + X^8U + X^7U + X^5U + X^4U + X^2U + X + 1$ . In that case, there is no need to set GeneratingPolynomial field. If otherwise set to DEFAULT\_POLYNOMIAL\_DISABLE, GeneratingPolynomial and CRCLength fields must be set.
- ***uint8\_t CRC\_InitTypeDef::DefaultInitValueUse***  
This parameter is a value of [CRC\\_Default\\_InitValue\\_Use](#) and indicates if default init value is used. If set to DEFAULT\_INIT\_VALUE\_ENABLE, resort to default 0xFFFFFFFF value. In that case, there is no need to set InitValue field. If otherwise set to DEFAULT\_INIT\_VALUE\_DISABLE, InitValue field must be set.
- ***uint32\_t CRC\_InitTypeDef::GeneratingPolynomial***  
Set CRC generating polynomial as a 7U, 8U, 16 or 32-bit long value for a polynomial degree respectively equal to 7U, 8U, 16 or 32. This field is written in normal representation, e.g., for a polynomial of degree 7U,  $X^7U + X^6U + X^5U + X^2U + 1$  is written 0x65. No need to specify it if DefaultPolynomialUse is set to DEFAULT\_POLYNOMIAL\_ENABLE.
- ***uint32\_t CRC\_InitTypeDef::CRCLength***  
This parameter is a value of [CRC\\_Polynomial\\_Sizes](#) and indicates CRC length. Value can be either one of CRC\_POLYLENGTH\_32B (32-bit CRC), CRC\_POLYLENGTH\_16B (16-bit CRC), CRC\_POLYLENGTH\_8B (8-bit CRC), CRC\_POLYLENGTH\_7B (7-bit CRC).
- ***uint32\_t CRC\_InitTypeDef::InitValue***  
Init value to initiate CRC computation. No need to specify it if DefaultInitValueUse is set to DEFAULT\_INIT\_VALUE\_ENABLE.
- ***uint32\_t CRC\_InitTypeDef::InputDataInversionMode***  
This parameter is a value of [CRCEX\\_Input\\_Data\\_Inversion](#) and specifies input data inversion mode. Can be either one of the following values  
CRC\_INPUTDATA\_INVERSION\_NONE, no input data inversion  
CRC\_INPUTDATA\_INVERSION\_BYTE, byte-wise inversion, 0x1A2B3C4D becomes 0x58D43CB2  
CRC\_INPUTDATA\_INVERSION\_HALFWORD, halfword-wise inversion, 0x1A2B3C4D becomes 0xD458B23C  
CRC\_INPUTDATA\_INVERSION\_WORD, word-wise inversion, 0x1A2B3C4D becomes 0xB23CD458U

- ***uint32\_t CRC\_InitTypeDef::OutputDataInversionMode***  
This parameter is a value of [\*\*CRCEx\\_Output\\_Data\\_Inversion\*\*](#) and specifies output data (i.e. CRC) inversion mode. Can be either  
CRC\_OUTPUTDATA\_INVERSION\_DISABLE: no CRC inversion,  
CRC\_OUTPUTDATA\_INVERSION\_ENABLE: CRC 0x11223344 is converted into 0x22CC4488U

### 13.1.2 CRC\_HandleTypeDef

#### Data Fields

- ***CRC\_TypeDef \* Instance***
- ***CRC\_InitTypeDef Init***
- ***HAL\_LockTypeDef Lock***
- ***\_IO HAL\_CRC\_StateTypeDef State***
- ***uint32\_t InputDataFormat***

#### Field Documentation

- ***CRC\_TypeDef\* CRC\_HandleTypeDef::Instance***  
Register base address
- ***CRC\_InitTypeDef CRC\_HandleTypeDef::Init***  
CRC configuration parameters
- ***HAL\_LockTypeDef CRC\_HandleTypeDef::Lock***  
CRC Locking object
- ***\_IO HAL\_CRC\_StateTypeDef CRC\_HandleTypeDef::State***  
CRC communication state
- ***uint32\_t CRC\_HandleTypeDef::InputDataFormat***  
This parameter is a value of [\*\*CRC\\_Input\\_Buffer\\_Format\*\*](#) and specifies input data format. Can be either CRC\_INPUTDATA\_FORMAT\_BYTES, input data is a stream of bytes (8-bit data) CRC\_INPUTDATA\_FORMAT\_HALFWORDS, input data is a stream of half-words (16-bit data) CRC\_INPUTDATA\_FORMAT\_WORDS, input data is a stream of words (32-bit data) Note that constant CRC\_INPUT\_FORMAT\_UNDEFINED is defined but an initialization error must occur if InputBufferFormat is not one of the three values listed above

## 13.2 CRC Firmware driver API description

### 13.2.1 How to use this driver

- Enable CRC AHB clock using `__HAL_RCC_CRC_CLK_ENABLE();`
- Initialize CRC calculator
  - specify generating polynomial (IP default or non-default one)
  - specify initialization value (IP default or non-default one)
  - specify input data format
  - specify input or output data inversion mode if any
- Use `HAL_CRC_Accumulate()` function to compute the CRC value of the input data buffer starting with the previously computed CRC as initialization value
- Use `HAL_CRC_Calculate()` function to compute the CRC value of the input data buffer starting with the defined initialization value (default or non-default) to initiate CRC calculation

### 13.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the CRC according to the specified parameters in the CRC\_InitTypeDef and create the associated handle
- DeInitialize the CRC peripheral
- Initialize the CRC MSP (MCU Specific Package)
- DeInitialize the CRC MSP

This section contains the following APIs:

- [\*HAL\\_CRC\\_Init\(\)\*](#)
- [\*HAL\\_CRC\\_DelInit\(\)\*](#)
- [\*HAL\\_CRC\\_MspInit\(\)\*](#)
- [\*HAL\\_CRC\\_MspDelInit\(\)\*](#)

### 13.2.3 Peripheral Control functions

This section provides functions allowing to:

- compute the 7U, 8U, 16 or 32-bit CRC value of an 8U, 16 or 32-bit data buffer using the combination of the previous CRC value and the new one  
or
- compute the 7U, 8U, 16 or 32-bit CRC value of an 8U, 16 or 32-bit data buffer independently of the previous CRC value.

This section contains the following APIs:

- [\*HAL\\_CRC\\_Accumulate\(\)\*](#)
- [\*HAL\\_CRC\\_Calculate\(\)\*](#)

### 13.2.4 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- [\*HAL\\_CRC\\_GetState\(\)\*](#)

### 13.2.5 Detailed description of functions

#### **HAL\_CRC\_Init**

|                      |                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CRC_Init (CRC_HandleTypeDef *<br/>hcrc)</b>                                                     |
| Function description | Initialize the CRC according to the specified parameters in the<br>CRC_InitTypeDef and initialize the associated handle. |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hcrc:</b> CRC handle</li></ul>                                                |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>                                                     |

**HAL\_CRC\_DeInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_CRC_DeInit (CRC_HandleTypeDef * hcrc)</b>          |
| Function description | DeInitialize the CRC peripheral.                                            |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcrc:</b> CRC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>      |

**HAL\_CRC\_MspInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_CRC_MspInit (CRC_HandleTypeDef * hcrc)</b>                      |
| Function description | Initializes the CRC MSP.                                                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcrc:</b> CRC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_CRC\_MspDeInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_CRC_MspDeInit (CRC_HandleTypeDef * hcrc)</b>                    |
| Function description | DeInitialize the CRC MSP.                                                   |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcrc:</b> CRC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_CRC\_Accumulate**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>uint32_t HAL_CRC_Accumulate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)</b>                                                                                                                                                                                                                                                                                                                |
| Function description | Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with the previously computed CRC as initialization value.                                                                                                                                                                                                                                                                         |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcrc:</b> CRC handle</li> <li>• <b>pBuffer:</b> pointer to the input data buffer, exact input data format is provided by hcrc-&gt;InputDataFormat.</li> <li>• <b>BufferLength:</b> input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>uint32_t:</b> CRC (returned value LSBs for CRC shorter than 32 bits)</li> </ul>                                                                                                                                                                                                                                                                                           |
| Notes                | <ul style="list-style-type: none"> <li>• By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc-&gt;InputDataFormat.</li> </ul>                                                                                              |

**HAL\_CRC\_Calculate**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <code>uint32_t HAL_CRC_Calculate (CRC_HandleTypeDef * hcrc,<br/>uint32_t pBuffer, uint32_t BufferLength)</code>                                                                                                                                                                                                                                                                                                       |
| Function description | Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with hcrc->Instance->INIT as initialization value.                                                                                                                                                                                                                                                                                |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcrc:</b> CRC handle</li> <li>• <b>pBuffer:</b> pointer to the input data buffer, exact input data format is provided by hcrc-&gt;InputDataFormat.</li> <li>• <b>BufferLength:</b> input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>uint32_t:</b> CRC (returned value LSBs for CRC shorter than 32 bits)</li> </ul>                                                                                                                                                                                                                                                                                           |
| Notes                | <ul style="list-style-type: none"> <li>• By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc-&gt;InputDataFormat.</li> </ul>                                                                                              |

|                      |                                                                                   |
|----------------------|-----------------------------------------------------------------------------------|
| Function name        | <code>HAL_CRC_StateTypeDef HAL_CRC_GetState<br/>(CRC_HandleTypeDef * hcrc)</code> |
| Function description | Return the CRC handle state.                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hcrc:</b> CRC handle</li> </ul>       |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> state</li> </ul>             |

## 13.3 CRC Firmware driver defines

### 13.3.1 CRC

***Default CRC computation initialization value***

`DEFAULT_CRC_INITVALUE` Initial CRC default value

***Indicates whether or not default init value is used***

`DEFAULT_INIT_VALUE_ENABLE` Enable initial CRC default value

`DEFAULT_INIT_VALUE_DISABLE` Disable initial CRC default value

***Indicates whether or not default polynomial is used***

`DEFAULT_POLYNOMIAL_ENABLE` Enable default generating polynomial 0x04C11DB7

`DEFAULT_POLYNOMIAL_DISABLE` Disable default generating polynomial 0x04C11DB7U

***Default CRC generating polynomial***

`DEFAULT_CRC32_POLY`  $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$

**CRC Exported Macros**`__HAL_CRC_RESET_HANDLE_STATE`**Description:**

- Reset CRC handle state.

**Parameters:**

- `__HANDLE__`: CRC handle.

**Return value:**

- None

`__HAL_CRC_DR_RESET`**Description:**

- Reset CRC Data Register.

**Parameters:**

- `__HANDLE__`: CRC handle

**Return value:**

- None

`__HAL_CRC_INITIALCRCVALUE_CONFIG`**Description:**

- Set CRC INIT non-default value.

**Parameters:**

- `__HANDLE__`: CRC handle
- `__INIT__`: 32-bit initial value

**Return value:**

- None

`__HAL_CRC_SET_IDR`**Description:**

- Store a 8-bit data in the Independent Data(ID) register.

**Parameters:**

- `__HANDLE__`: CRC handle
- `__VALUE__`: 8-bit value to be stored in the ID register

**Return value:**

- None

`__HAL_CRC_GET_IDR`**Description:**

- Return the 8-bit data stored in the Independent Data(ID) register.

**Parameters:**

- `__HANDLE__`: CRC handle

**Return value:**

- 8-bit: value of the ID register

***Input Buffer Format***

|                                |                                |
|--------------------------------|--------------------------------|
| CRC_INPUTDATA_FORMAT_UNDEFINED | Undefined input data format    |
| CRC_INPUTDATA_FORMAT_BYTES     | Input data in byte format      |
| CRC_INPUTDATA_FORMAT_HALFWORDS | Input data in half-word format |
| CRC_INPUTDATA_FORMAT_WORDS     | Input data in word format      |

***Polynomial sizes to configure the IP***

|                    |                                               |
|--------------------|-----------------------------------------------|
| CRC_POLYLENGTH_32B | Resort to a 32-bit long generating polynomial |
| CRC_POLYLENGTH_16B | Resort to a 16-bit long generating polynomial |
| CRC_POLYLENGTH_8B  | Resort to a 8-bit long generating polynomial  |
| CRC_POLYLENGTH_7B  | Resort to a 7-bit long generating polynomial  |

***CRC polynomial possible sizes actual definitions***

|                    |                 |
|--------------------|-----------------|
| HAL_CRC_LENGTH_32B | 32-bit long CRC |
| HAL_CRC_LENGTH_16B | 16-bit long CRC |
| HAL_CRC_LENGTH_8B  | 8-bit long CRC  |
| HAL_CRC_LENGTH_7B  | 7-bit long CRC  |

## 14 HAL CRC Extension Driver

### 14.1 CRCEEx Firmware driver API description

#### 14.1.1 How to use this driver

- Set user-defined generating polynomial thru HAL\_CRCEEx\_Polynomial\_Set()
- Configure Input or Output data inversion

#### 14.1.2 Detailed description of functions

##### **HAL\_CRCEEx\_Polynomial\_Set**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Pointer DMA handler for channel 2U
- ***\_IO uint32\_t \_\_DAC\_HandleTypeDef::ErrorCode***  
DAC Error code

## 15.2 DAC Firmware driver API description

### 15.2.1 DAC Peripheral features

#### DAC Channels

The device integrates up to 3 12-bit Digital Analog Converters that can be used independently or simultaneously (dual mode):

1. DAC1 channel1 with DAC1\_OUT1 (PA4) as output
2. DAC1 channel2 with DAC1\_OUT2 (PA5) as output (for STM32F3 devices having 2 channels on DAC1)
3. DAC2 channel1 with DAC2\_OUT1 (PA6) as output (for STM32F3 devices having 2 DAC)

#### DAC Triggers

Digital to Analog conversion can be non-triggered using DAC\_TRIGGER\_NONE and DAC1\_OUT1/DAC1\_OUT2/DAC2\_OUT1 is available once writing to DHRx register.

Digital to Analog conversion can be triggered by:

1. External event: EXTI Line 9 (any GPIOx\_PIN\_9) using DAC\_TRIGGER\_EXT\_IT9. The used pin (GPIOx\_PIN\_9) must be configured in input mode.
2. Timers TRGO: TIM2, TIM4, TIM5, TIM6, TIM7 and TIM8 (DAC\_TRIGGER\_T2\_TRGO, DAC\_TRIGGER\_T4\_TRGO...)
3. Software using DAC\_TRIGGER\_SOFTWARE

#### DAC Buffer mode feature

Each DAC channel integrates an output buffer that can be used to reduce the output impedance, and to drive external loads directly without having to add an external operational amplifier. To enable, the output buffer use sConfig.DAC\_OutputBuffer = DAC\_OUTPUTBUFFER\_ENABLE; Or An output switch (in STM32F303x4, STM32F303x6, STM32F303x8 c, STM32F334x6, STM32F334x8 & STM32F334xx). To enable, the output switch sConfig.DAC\_OutputSwitch = DAC\_OUTPUTSWITCH\_ENABLE;

Refer to the device datasheet for more details about output impedance value with and without output buffer.

#### GPIO configurations guidelines

When a DAC channel is used (ex channel1 on PA4) and the other is not (ex channel2 on PA5 is configured in Analog and disabled). Channel1 may disturb channel2 as coupling effect. Note that there is no coupling on channel2 as soon as channel2 is turned on. Coupling on adjacent channel could be avoided as follows: when unused PA5 is configured as INPUT PULL-UP or DOWN. PA5 is configured in ANALOG just before it is turned on.

#### DAC wave generation feature

Both DAC channels of DAC1 can be used to generate note that wave generation is not available in DAC2.

1. Noise wave
2. Triangle wave Wave generation is NOT available in DAC2.

### DAC data format

The DAC data format can be:

1. 8-bit right alignment using DAC\_ALIGN\_8B\_R
2. 12-bit left alignment using DAC\_ALIGN\_12B\_L
3. 12-bit right alignment using DAC\_ALIGN\_12B\_R

### DAC data value to voltage correspondance

The analog output voltage on each DAC channel pin is determined by the following equation:

$$\text{DAC\_OUTx} = \text{VREF+} * \text{DOR} / 4095$$

- with DOR is the Data Output Register

VREF+ is the input voltage reference (refer to the device datasheet)

e.g. To set DAC\_OUT1 to 0.7V, use

- Assuming that VREF+ = 3.3V, DAC\_OUT1 =  $(3.3U * 868U) / 4095U = 0.7V$

### DMA requests

A DMA1 or DMA2 request can be generated when an external trigger (but not a software trigger) occurs if DMA1 or DMA2 requests are enabled using HAL\_DAC\_Start\_DMA().

For Dual mode and specific signal (Triangle and noise) generation please refer to Extended Features Driver description

## 15.2.2 How to use this driver

- DAC APB clock must be enabled to get write access to DAC registers using HAL\_DAC\_Init()
- Configure DAC\_OUTx (DAC\_OUT1: PA4, DAC\_OUT2: PA5) in analog mode.
- Configure the DAC channel using HAL\_DAC\_ConfigChannel() function.
- Enable the DAC channel using HAL\_DAC\_Start() or HAL\_DAC\_Start\_DMA() functions

### Polling mode IO operation

- Start the DAC peripheral using HAL\_DAC\_Start()
- To read the DAC last data output value, use the HAL\_DAC\_GetValue() function.
- Stop the DAC peripheral using HAL\_DAC\_Stop()

### DMA mode IO operation

- Start the DAC peripheral using HAL\_DAC\_Start\_DMA(), at this stage the user specify the length of data to be transferred at each end of conversion
- At the middle of data transfer HAL\_DAC\_ConvHalfCpltCallbackCh1() or HAL\_DACEx\_ConvHalfCpltCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL\_DAC\_ConvHalfCpltCallbackCh1() or HAL\_DACEx\_ConvHalfCpltCallbackCh2()
- At The end of data transfer HAL\_DAC\_ConvCpltCallbackCh1() or HAL\_DACEx\_ConvHalfCpltCallbackCh2() function is executed and user can add his

- own code by customization of function pointer HAL\_DAC\_ConvCpltCallbackCh1() or HAL\_DACEx\_ConvHalfCpltCallbackCh2()
- In case of transfer Error, HAL\_DAC\_ErrorCallbackCh1() function is executed and user can add his own code by customization of function pointer HAL\_DAC\_ErrorCallbackCh1
- In case of DMA underrun, DAC interruption triggers and execute internal function HAL\_DAC\_IRQHandler. HAL\_DAC\_DMAUnderrunCallbackCh1() or HAL\_DACEx\_DMAUnderrunCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL\_DAC\_DMAUnderrunCallbackCh1() or HAL\_DACEx\_DMAUnderrunCallbackCh2() and add his own code by customization of function pointer HAL\_DAC\_ErrorCallbackCh1()
- Stop the DAC peripheral using HAL\_DAC\_Stop\_DMA()

### DAC HAL driver macros list

Below the list of most used macros in DAC HAL driver.

- `__HAL_DAC_ENABLE` : Enable the DAC peripheral
- `__HAL_DAC_DISABLE` : Disable the DAC peripheral
- `__HAL_DAC_CLEAR_FLAG`: Clear the DAC's pending flags
- `__HAL_DAC_GET_FLAG`: Get the selected DAC's flag status

You can refer to the DAC HAL driver header file for more useful macros

### 15.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the DAC.
- De-initialize the DAC.

This section contains the following APIs:

- `HAL_DAC_Init()`
- `HAL_DAC_DeInit()`
- `HAL_DAC_MspInit()`
- `HAL_DAC_MspDeInit()`

### 15.2.4 IO operation functions

This section provides functions allowing to:

- Start conversion.
- Stop conversion.
- Start conversion and enable DMA transfer.
- Stop conversion and disable DMA transfer.
- Get result of conversion.
- Get result of dual mode conversion.

This section contains the following APIs:

- `HAL_DAC_Start()`
- `HAL_DAC_Stop()`
- `HAL_DAC_Stop_DMA()`

- [`HAL\_DAC\_GetValue\(\)`](#)
- [`HAL\_DACEx\_DualGetValue\(\)`](#)
- [`HAL\_DAC\_ConvCpltCallbackCh1\(\)`](#)
- [`HAL\_DAC\_ConvHalfCpltCallbackCh1\(\)`](#)
- [`HAL\_DAC\_ErrorCallbackCh1\(\)`](#)
- [`HAL\_DAC\_DMAUnderrunCallbackCh1\(\)`](#)
- [`HAL\_DAC\_Start\_DMA\(\)`](#)
- [`HAL\_DAC\_ConfigChannel\(\)`](#)
- [`HAL\_DAC\_IRQHandler\(\)`](#)

### 15.2.5 Peripheral Control functions

This section provides functions allowing to:

- Configure channels.
- Configure Triangle wave generation.
- Configure Noise wave generation.
- Set the specified data holding register value for DAC channel.
- Set the specified data holding register value for Dual DAC channels.

This section contains the following APIs:

- [`HAL\_DAC\_ConfigChannel\(\)`](#)
- [`HAL\_DAC\_SetValue\(\)`](#)
- [`HAL\_DACEx\_DualSetValue\(\)`](#)

### 15.2.6 DAC Peripheral State and Error functions

This subsection provides functions allowing to

- Check the DAC state.
- Check the DAC Errors.

This section contains the following APIs:

- [`HAL\_DAC\_GetState\(\)`](#)
- [`HAL\_DAC\_GetError\(\)`](#)

### 15.2.7 Detailed description of functions

#### `HAL_DAC_Init`

- Reset DAC handle state.

**Parameters:**

- `_HANDLE_`: specifies the DAC handle.

**Return value:**

- None

`_HAL_DAC_ENABLE`**Description:**

- Enable the DAC channel.

**Parameters:**

- `_HANDLE_`: specifies the DAC handle.
- `_DAC_Channel_`: specifies the DAC channel

**Return value:**

- None

`_HAL_DAC_DISABLE`**Description:**

- Disable the DAC channel.

**Parameters:**

- `_HANDLE_`: specifies the DAC handle

- DAC\_Channel: specifies the DAC channel.

**Return value:**

- None

DAC\_DHR12R1\_ALIGNMENT

**Description:**

- Set DHR12R1 alignment.

**Parameters:**

- ALIGNMENT: specifies the DAC alignment

**Return value:**

- None

DAC\_DHR12R2\_ALIGNMENT

**Description:**

- Set DHR12R2 alignment.

**Parameters:**

- ALIGNMENT: specifies the DAC alignment

**Return value:**

- None

DAC\_DHR12RD\_ALIGNMENT

**Description:**

- Set DHR12RD alignment.

**Parameters:**

- ALIGNMENT: specifies the DAC alignment

**Return value:**

- None

\_HAL\_DAC\_ENABLE\_IT**Description:**

- Enable the DAC interrupt.

**Parameters:**

- HANDLE: specifies the DAC handle
- INTERRUPT: specifies the DAC interrupt. This parameter can be any combination of the following values:
  - DAC\_IT\_DMAUDR1: DAC channel 1 DMA underrun interrupt
  - DAC\_IT\_DMAUDR2: DAC channel 2 DMA underrun interrupt

**Return value:**

- None

\_\_HAL\_DAC\_DISABLE\_IT**Description:**

- Disable the DAC interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the DAC handle
- \_\_INTERRUPT\_\_: specifies the DAC interrupt. This parameter can be any combination of the following values:
  - DAC\_IT\_DMAUDR1: DAC channel 1 DMA underrun interrupt
  - DAC\_IT\_DMAUDR2: DAC channel 2 DMA underrun interrupt

**Return value:**

- None

\_\_HAL\_DAC\_GET\_IT\_SOURCE**Description:**

- Check whether the specified DAC interrupt source is enabled or not.

**Parameters:**

- \_\_HANDLE\_\_: DAC handle
- \_\_INTERRUPT\_\_: DAC interrupt source to check. This parameter can be any combination of the following values:
  - DAC\_IT\_DMAUDR1: DAC channel 1 DMA underrun interrupt
  - DAC\_IT\_DMAUDR2: DAC channel 2 DMA underrun interrupt

**Return value:**

- State: of interruption (SET or RESET)

\_\_HAL\_DAC\_GET\_FLAG**Description:**

- Get the selected DAC's flag status.

**Parameters:**

- \_\_HANDLE\_\_: specifies the DAC handle.
- \_\_FLAG\_\_: specifies the DAC flag to get. This parameter can be any combination of the following values:
  - DAC\_FLAG\_DMAUDR1: DAC channel 1 DMA underrun flag
  - DAC\_FLAG\_DMAUDR2: DAC channel 2 DMA underrun flag

**Return value:**

- None

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 16 HAL DAC Extension Driver

### 16.1 DACEx Firmware driver API description

#### 16.1.1 How to use this driver

- When Dual mode is enabled (i.e. DAC Channel1 and Channel2 are used simultaneously) : Use HAL\_DACEx\_DualGetValue() to get digital data to be converted and use HAL\_DACEx\_DualSetValue() to set digital value to converted simultaneously in Channel 1 and Channel 2.
- Use HAL\_DACEx\_TriangleWaveGenerate() to generate Triangle signal.
- Use HAL\_DACEx\_NoiseWaveGenerate() to generate Noise signal.

#### 16.1.2 Peripheral Control functions

This section provides functions allowing to:

- Set the specified data holding register value for DAC channel.
- Set the specified data holding register value for dual DAC channel (when DAC channel 2 is present in DAC 1U)

This section contains the following APIs:

- [`HAL\_DAC\_SetValue\(\)`](#)
- [`HAL\_DACEx\_DualSetValue\(\)`](#)

#### 16.1.3 IO operation functions

This section provides functions allowing to:

- Start conversion.
- Start conversion and enable DMA transfer.
- Get result of conversion.
- Handle DAC IRQ's.
- Generate triangular-wave
- Generate noise-wave
- Callback functions for DAC1 Channel2 (when supported)

This section contains the following APIs:

- [`HAL\_DAC\_Start\(\)`](#)
- [`HAL\_DAC\_Start\_DMA\(\)`](#)
- [`HAL\_DAC\_GetValue\(\)`](#)
- [`HAL\_DACEx\_DualGetValue\(\)`](#)
- [`HAL\_DAC\_IRQHandler\(\)`](#)
- [`HAL\_DAC\_ConfigChannel\(\)`](#)
- [`HAL\_DACEx\_TriangleWaveGenerate\(\)`](#)
- [`HAL\_DACEx\_NoiseWaveGenerate\(\)`](#)
- [`HAL\_DACEx\_ConvCpltCallbackCh2\(\)`](#)
- [`HAL\_DACEx\_ConvHalfCpltCallbackCh2\(\)`](#)
- [`HAL\_DACEx\_ErrorCallbackCh2\(\)`](#)
- [`HAL\_DACEx\_DMAUnderrunCallbackCh2\(\)`](#)
- [`HAL\_DACEx\_DualSetValue\(\)`](#)

### 16.1.4 Detailed description of functions

#### HAL\_DACEx\_DualGetValue

##### Field Documentation

- ***uint32\_t DMA\_InitTypeDef::Direction***  
Specifies if the data will be transferred from memory to peripheral, from memory to memory or from peripheral to memory. This parameter can be a value of [\*\*DMA\\_Data\\_transfer\\_direction\*\*](#)
- ***uint32\_t DMA\_InitTypeDef::PeriphInc***  
Specifies whether the Peripheral address register should be incremented or not. This parameter can be a value of [\*\*DMA\\_Peripheral\\_incremented\\_mode\*\*](#)
- ***uint32\_t DMA\_InitTypeDef::MemInc***  
Specifies whether the memory address register should be incremented or not. This parameter can be a value of [\*\*DMA\\_Memory\\_incremented\\_mode\*\*](#)
- ***uint32\_t DMA\_InitTypeDef::PeriphDataAlignment***  
Specifies the Peripheral data width. This parameter can be a value of [\*\*DMA\\_Peripheral\\_data\\_size\*\*](#)
- ***uint32\_t DMA\_InitTypeDef::MemDataAlignment***  
Specifies the Memory data width. This parameter can be a value of [\*\*DMA\\_Memory\\_data\\_size\*\*](#)
- ***uint32\_t DMA\_InitTypeDef::Mode***  
Specifies the operation mode of the DMAy Channelx. This parameter can be a value of [\*\*DMA\\_mode\*\*](#)  
**Note:**The circular buffer mode cannot be used if the memory-to-memory data transfer is configured on the selected Channel
- ***uint32\_t DMA\_InitTypeDef::Priority***  
Specifies the software priority for the DMAy Channelx. This parameter can be a value of [\*\*DMA\\_Priority\\_level\*\*](#)

DMA transfer state
- `void* __DMA_HandleTypeDef::Parent`  
Parent object state
- `void(* __DMA_HandleTypeDef::XferCpltCallback)(struct __DMA_HandleTypeDef *hdma)`  
DMA transfer complete callback
- `void(* __DMA_HandleTypeDef::XferHalfCpltCallback)(struct __DMA_HandleTypeDef *hdma)`  
DMA Half transfer complete callback
- `void(* __DMA_HandleTypeDef::XferErrorCallback)(struct __DMA_HandleTypeDef *hdma)`  
DMA transfer error callback
- `void(* __DMA_HandleTypeDef::XferAbortCallback)(struct __DMA_HandleTypeDef *hdma)`  
DMA transfer abort callback
- `__IO uint32_t __DMA_HandleTypeDef::ErrorCode`  
DMA Error code
- `DMA_TypeDef* __DMA_HandleTypeDef::DmaBaseAddress`  
DMA Channel Base Address
- `uint32_t __DMA_HandleTypeDef::ChannelIndex`  
DMA Channel Index

## 17.2 DMA Firmware driver API description

### 17.2.1 How to use this driver

1. Enable and configure the peripheral to be connected to the DMA Channel (except for internal SRAM / FLASH memories: no initialization is necessary). Please refer to Reference manual for connection between peripherals and DMA requests .
2. For a given Channel, program the required configuration through the following parameters: Transfer Direction, Source and Destination data formats, Circular or Normal mode, Channel Priority level, Source and Destination Increment mode, using HAL\_DMA\_Init() function.
3. Use HAL\_DMA\_GetState() function to return the DMA state and HAL\_DMA\_GetError() in case of error detection.
4. Use HAL\_DMA\_Abort() function to abort the current transfer In Memory-to-Memory transfer mode, Circular mode is not allowed.

### Polling mode IO operation

- Use HAL\_DMA\_Start() to start DMA transfer after the configuration of Source address and destination address and the Length of data to be transferred
- Use HAL\_DMA\_PollForTransfer() to poll for the end of current transfer, in this case a fixed Timeout can be configured by User depending from his application.

### Interrupt mode IO operation

- Configure the DMA interrupt priority using HAL\_NVIC\_SetPriority()
- Enable the DMA IRQ handler using HAL\_NVIC\_EnableIRQ()
- Use HAL\_DMA\_Start\_IT() to start DMA transfer after the configuration of Source address and destination address and the Length of data to be transferred. In this case the DMA interrupt is configured
- Use HAL\_DMA\_Channel\_IRQHandler() called under DMA\_IRQHandler() Interrupt subroutine
- At the end of data transfer HAL\_DMA\_IRQHandler() function is executed and user can add his own function by customization of function pointer XferCpltCallback and XferErrorCallback (i.e a member of DMA handle structure).

### DMA HAL driver macros list

Below the list of most used macros in DMA HAL driver.

You can refer to the DMA HAL driver header file for more useful macros

## 17.2.2 Initialization and de-initialization functions

This section provides functions allowing to initialize the DMA Channel source and destination addresses, incrementation and data sizes, transfer direction, circular/normal mode selection, memory-to-memory mode selection and Channel priority value.

The HAL\_DMA\_Init() function follows the DMA configuration procedures as described in reference manual.

This section contains the following APIs:

- [\*\*HAL\\_DMA\\_Init\(\)\*\*](#)
- [\*\*HAL\\_DMA\\_DeInit\(\)\*\*](#)

## 17.2.3 IO operation functions

This section provides functions allowing to:

- Configure the source, destination address and data length and Start DMA transfer
- Configure the source, destination address and data length and Start DMA transfer with interrupt
- Abort DMA transfer
- Poll for transfer complete
- Handle DMA interrupt request

This section contains the following APIs:

- [\*\*HAL\\_DMA\\_Start\(\)\*\*](#)
- [\*\*HAL\\_DMA\\_Start\\_IT\(\)\*\*](#)
- [\*\*HAL\\_DMA\\_Abort\(\)\*\*](#)

- [\*HAL\\_DMA\\_Abort\\_IT\(\)\*](#)
- [\*HAL\\_DMA\\_PollForTransfer\(\)\*](#)
- [\*HAL\\_DMA\\_IRQHandler\(\)\*](#)
- [\*HAL\\_DMA\\_RegisterCallback\(\)\*](#)
- [\*HAL\\_DMA\\_UnRegisterCallback\(\)\*](#)

#### 17.2.4 State and Errors functions

This subsection provides functions allowing to

- Check the DMA state
- Get error code

This section contains the following APIs:

- [\*HAL\\_DMA\\_GetState\(\)\*](#)
- [\*HAL\\_DMA\\_GetError\(\)\*](#)

#### 17.2.5 Detailed description of functions

##### **HAL\_DMA\_Init**

| <b>HAL_DMA_ERROR_TE</b>            | Transfer error      |
| <b>HAL_DMA_ERROR_NO_XFER</b>       | no ongoing transfer |
| <b>HAL_DMA_ERROR_TIMEOUT</b>       | Timeout error       |
| <b>HAL_DMA_ERROR_NOT_SUPPORTED</b> | Not supported mode  |

*DMA Exported Macros***\_HAL\_DMA\_RESET\_HANDLE\_STATE** **Description:**

- Reset DMA handle state.

**Parameters:**

- **\_HANDLE\_**: DMA handle.

**Return value:**

- None

`__HAL_DMA_ENABLE`

**Description:**

- Enable the specified DMA Channel.

**Parameters:**

- `__HANDLE__`: DMA handle

**Return value:**

- None

`__HAL_DMA_DISABLE`

**Description:**

- Disable the specified DMA Channel.

**Parameters:**

- `__HANDLE__`: DMA handle

**Return value:**

- None

`__HAL_DMA_ENABLE_IT`

**Description:**

- Enables the specified DMA Channel interrupts.

**Parameters:**

- `__HANDLE__`: DMA handle
- `__INTERRUPT__`: specifies the DMA interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - `DMA_IT_TC`: Transfer complete interrupt mask
  - `DMA_IT_HT`: Half transfer complete interrupt mask
  - `DMA_IT_TE`: Transfer error interrupt mask

**Return value:**

- None

`__HAL_DMA_DISABLE_IT`

**Description:**

- Disables the specified DMA Channel interrupts.

**Parameters:**

- `__HANDLE__`: DMA handle
- `__INTERRUPT__`: specifies the DMA interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - `DMA_IT_TC`: Transfer complete interrupt mask
  - `DMA_IT_HT`: Half transfer complete interrupt mask

- DMA\_IT\_TE: Transfer error interrupt mask

**Return value:**

- None

`__HAL_DMA_GET_IT_SOURCE`

- Description:**

  - Checks whether the specified DMA Channel interrupt is enabled or disabled.

**Parameters:**

- `__HANDLE__`: DMA handle
- `__INTERRUPT__`: specifies the DMA interrupt source to check. This parameter can be one of the following values:
  - DMA\_IT\_TC: Transfer complete interrupt mask
  - DMA\_IT\_HT: Half transfer complete interrupt mask
  - DMA\_IT\_TE: Transfer error interrupt mask

**Return value:**

- The: state of DMA\_IT (SET or RESET).

`__HAL_DMA_GET_COUNTER`

- Description:**

  - Returns the number of remaining data units in the current DMAy Channelx transfer.

**Parameters:**

- `__HANDLE__`: DMA handle

**Return value:**

- The: number of remaining data units in the current DMA Channel transfer.

**DMA flag definitions**

**DMA Peripheral incremented mode**

`DMA_PINC_ENABLE` Peripheral increment mode Enable

`DMA_PINC_DISABLE` Peripheral increment mode Disable

**DMA Priority level**

`DMA_PRIORITY_LOW` Priority level : Low

`DMA_PRIORITY_MEDIUM` Priority level : Medium

`DMA_PRIORITY_HIGH` Priority level : High

`DMA_PRIORITY VERY_HIGH` Priority level : Very\_High

**DMA Remap Enable**

`__HAL_DMA_REMAP_CHANNEL_ENABLE` **Description:**

- DMA remapping enable/disable macros.

**Parameters:**

- `__DMA_REMAP__`: This parameter can be a value of

`__HAL_DMA_REMAP_CHANNEL_DISABLE`

## 18 HAL DMA Extension Driver

### 18.1 DMAEx Firmware driver defines

#### 18.1.1 DMAEx

##### *DMA Extended Exported Macros*

- `__HAL_DMA_GET_TC_FLAG_INDEX` **Description:**
- Returns the current DMA Channel transfer complete flag.
- Parameters:**
- `__HANDLE__`: DMA handle
- Return value:**
- The: specified transfer complete flag index.
- `__HAL_DMA_GET_HT_FLAG_INDEX` **Description:**
- Returns the current DMA Channel half transfer complete flag.
- Parameters:**
- `__HANDLE__`: DMA handle
- Return value:**
- The: specified half transfer complete flag index.
- `__HAL_DMA_GET_TE_FLAG_INDEX` **Description:**
- Returns the current DMA Channel transfer error flag.
- Parameters:**
- `__HANDLE__`: DMA handle
- Return value:**
- The: specified transfer error flag index.
- `__HAL_DMA_GET_GI_FLAG_INDEX` **Description:**
- Return the current DMA Channel Global interrupt flag.
- Parameters:**
- `__HANDLE__`: DMA handle
- Return value:**
- The: specified transfer error flag index.
- `__HAL_DMA_GET_FLAG` **Description:**
- Get the DMA Channel pending flags.

**Parameters:**

- `_HANDLE_`: DMA handle
- `_FLAG_`: Get the specified flag. This parameter can be any combination of the following values:
  - `DMA_FLAG_TCx`: Transfer complete flag
  - `DMA_FLAG_HTx`: Half transfer complete flag
  - `DMA_FLAG_TEx`: Transfer error flag Where x can be `1_7` or `1_5` (depending on DMA1 or DMA2) to select the DMA Channel flag.

**Return value:**

- The state of FLAG (SET or RESET).

`__HAL_DMA_CLEAR_FLAG`

**Description:**

- Clears the DMA Channel pending flags.

**Parameters:**

- `_HANDLE_`: DMA handle
- `_FLAG_`: specifies the flag to clear. This parameter can be any combination of the following values:
  - `DMA_FLAG_TCx`: Transfer complete flag
  - `DMA_FLAG_HTx`: Half transfer complete flag
  - `DMA_FLAG_TEx`: Transfer error flag Where x can be `1_7` or `1_5` (depending on DMA1 or DMA2) to select the DMA Channel flag.

**Return value:**

- None

## 19 HAL FLASH Generic Driver

### 19.1 FLASH Firmware driver registers structures

#### 19.1.1 FLASH\_ProcTypeDef

##### Data Fields

- `__IO FLASH_ProcTypeDef ProcedureOnGoing`
- `__IO uint32_t DataRemaining`
- `__IO uint32_t Address`
- `__IO uint64_t Data`
- `HAL_LockTypeDef Lock`
- `__IO uint32_t ErrorCode`

##### Field Documentation

- `__IO FLASH_ProcTypeDef FLASH_ProcTypeDef::ProcedureOnGoing`  
Internal variable to indicate which procedure is ongoing or not in IT context
- `__IO uint32_t FLASH_ProcTypeDef::DataRemaining`  
Internal variable to save the remaining pages to erase or half-word to program in IT context
- `__IO uint32_t FLASH_ProcTypeDef::Address`  
Internal variable to save address selected for program or erase
- `__IO uint64_t FLASH_ProcTypeDef::Data`  
Internal variable to save data to be programmed
- `HAL_LockTypeDef FLASH_ProcTypeDef::Lock`  
FLASH locking object
- `__IO uint32_t FLASH_ProcTypeDef::ErrorCode`  
FLASH error code This parameter can be a value of [FLASH\\_Error\\_Codes](#)

### 19.2 FLASH Firmware driver API description

#### 19.2.1 FLASH peripheral features

The Flash memory interface manages CPU AHB I-Code and D-Code accesses to the Flash memory. It implements the erase and program Flash memory operations and the read and write protection mechanisms.

The Flash memory interface accelerates code execution with a system of instruction prefetch.

The FLASH main features are:

- Flash memory read operations
- Flash memory program/erase operations
- Read / write protections
- Prefetch on I-Code
- Option Bytes programming

### 19.2.2 How to use this driver

This driver provides functions and macros to configure and program the FLASH memory of all STM32F3xx devices.

1. FLASH Memory I/O Programming functions: this group includes all needed functions to erase and program the main memory:
  - Lock and Unlock the FLASH interface
  - Erase function: Erase page, erase all pages
  - Program functions: half word, word and doubleword
2. FLASH Option Bytes Programming functions: this group includes all needed functions to manage the Option Bytes:
  - Lock and Unlock the Option Bytes
  - Set/Reset the write protection
  - Set the Read protection Level
  - Program the user Option Bytes
  - Launch the Option Bytes loader
  - Erase Option Bytes
  - Program the data Option Bytes
  - Get the Write protection.
  - Get the user option bytes.
3. Interrupts and flags management functions : this group includes all needed functions to:
  - Handle FLASH interrupts
  - Wait for last FLASH operation according to its status
  - Get error flag status

In addition to these function, this driver includes a set of macros allowing to handle the following operations:

- Set/Get the latency
- Enable/Disable the prefetch buffer
- Enable/Disable the half cycle access
- Enable/Disable the FLASH interrupts
- Monitor the FLASH flags status

### 19.2.3 Peripheral Control functions

This subsection provides a set of functions allowing to control the FLASH memory operations.

This section contains the following APIs:

- [\*HAL\\_FLASH\\_Unlock\(\)\*](#)
- [\*HAL\\_FLASH\\_Lock\(\)\*](#)
- [\*HAL\\_FLASH\\_OB\\_Unlock\(\)\*](#)
- [\*HAL\\_FLASH\\_OB\\_Lock\(\)\*](#)
- [\*HAL\\_FLASH\\_OB\\_Launch\(\)\*](#)

### 19.2.4 Peripheral Errors functions

This subsection permit to get in run-time errors of the FLASH peripheral.

This section contains the following APIs:

- [\*HAL\\_FLASH\\_GetError\(\)\*](#)

## 19.2.5 Detailed description of functions

### HAL\_FLASH\_Program

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**HAL\_FLASH\_OB\_Lock**

Function name      **HAL\_StatusTypeDef HAL\_FLASH\_OB\_Lock (void )**

Function description      Lock the FLASH Option Control Registers access.

Return values      •    **HAL:** Status

**HAL\_FLASH\_OB\_Launch**

Function name      **HAL\_StatusTypeDef HAL\_FLASH\_OB\_Launch (void )**

Function description      Launch the option byte loading.

Return values      •    **HAL:** Status

Notes      •    This function will reset automatically the MCU.

**HAL\_FLASH\_GetError**

Function name      **uint32\_t HAL\_FLASH\_GetError (void )**

Function description      Get the specific FLASH error flag.

Return values      •    **FLASH\_ErrorCode:** The returned value can be: FLASH Error Codes

**FLASH\_WaitForLastOperation**

Function name      **HAL\_StatusTypeDef FLASH\_WaitForLastOperation (uint32\_t Timeout)**

Function description      Wait for a FLASH operation to complete.

Parameters      •    **Timeout:** maximum flash operation timeout

Return values      •    **HAL:** Status

## 19.3 FLASH Firmware driver defines

### 19.3.1 FLASH

***FLASH Error Codes***

**HAL\_FLASH\_ERROR\_NONE**      No error

**HAL\_FLASH\_ERROR\_PROG**      Programming error

**HAL\_FLASH\_ERROR\_WRP**      Write protection error

***FLASH Flag definition***

**FLASH\_FLAG\_BSY**      FLASH Busy flag

**FLASH\_FLAG\_PGERR**      FLASH Programming error flag

**FLASH\_FLAG\_WRPERR**      FLASH Write protected error flag

**FLASH\_FLAG\_EOP**      FLASH End of Operation flag

***FLASH Half Cycle***

`__HAL_FLASH_HALF_CYCLE_ACCESS_ENABLE`   **Description:**  
• Enable the FLASH half cycle access.

**Return value:**

- None

`__HAL_FLASH_HALF_CYCLE_ACCESS_DISABLE`   **Description:**  
• Disable the FLASH half cycle access.

**Return value:**

- None

***FLASH Interrupts***

`__HAL_FLASH_ENABLE_IT`   **Description:**  
• Enable the specified FLASH interrupt.

**Parameters:**

- `__INTERRUPT__`: FLASH interrupt This parameter can be any combination of the following values:
  - `FLASH_IT_EOP` End of FLASH Operation Interrupt
  - `FLASH_IT_ERR` Error Interrupt

**Return value:**

- none

`__HAL_FLASH_DISABLE_IT`   **Description:**  
• Disable the specified FLASH interrupt.

**Parameters:**

- `__INTERRUPT__`: FLASH interrupt This parameter can be any combination of the following values:
  - `FLASH_IT_EOP` End of FLASH Operation Interrupt
  - `FLASH_IT_ERR` Error Interrupt

**Return value:**

- none

`__HAL_FLASH_GET_FLAG`   **Description:**  
• Get the specified FLASH flag status.

**Parameters:**

- `__FLAG__`: specifies the FLASH flag to check. This parameter can be one of the following values:
  - `FLASH_FLAG_BSY` FLASH Busy flag
  - `FLASH_FLAG_EOP` FLASH End of Operation flag
  - `FLASH_FLAG_WRPERR` FLASH Write

- protected error flag
- FLASH\_FLAG\_PGERR FLASH Programming error flag

**Return value:**

- The new state of \_\_FLAG\_\_ (SET or RESET).

**\_HAL\_FLASH\_CLEAR\_FLAG****Description:**

- Clear the specified FLASH flag.

**Parameters:**

- \_\_FLAG\_\_: specifies the FLASH flags to clear. This parameter can be any combination of the following values:
  - FLASH\_FLAG\_EOP FLASH End of Operation flag
  - FLASH\_FLAG\_WRPERR FLASH Write protected error flag
  - FLASH\_FLAG\_PGERR FLASH Programming error flag

**Return value:**

- none

***FLASH Interrupt definition***

**FLASH\_IT\_EOP** End of FLASH Operation Interrupt source

**FLASH\_IT\_ERR** Error Interrupt source

***FLASH Latency***

**FLASH\_LATENCY\_0** FLASH Zero Latency cycle

**FLASH\_LATENCY\_1** FLASH One Latency cycle

**FLASH\_LATENCY\_2** FLASH Two Latency cycles

***FLASH Prefetch*****\_HAL\_FLASH\_PREFETCH\_BUFFER\_ENABLE** **Description:**

- Enable the FLASH prefetch buffer.

**Return value:**

- None

**\_HAL\_FLASH\_PREFETCH\_BUFFER\_DISABLE** **Description:**

- Disable the FLASH prefetch buffer.

**Return value:**

- None

***FLASH Type Program***

|                              |                                                       |
|------------------------------|-------------------------------------------------------|
| FLASH_TYPEPROGRAM_HALFWORD   | Program a half-word (16-bit) at a specified address.  |
| FLASH_TYPEPROGRAM_WORD       | Program a word (32-bit) at a specified address.       |
| FLASH_TYPEPROGRAM_DOUBLEWORD | Program a double word (64-bit) at a specified address |

## 20 HAL FLASH Extension Driver

### 20.1 FLASHEx Firmware driver registers structures

#### 20.1.1 FLASH\_EraseInitTypeDef

##### Data Fields

- *uint32\_t TypeErase*
- *uint32\_t PageAddress*
- *uint32\_t NbPages*

##### Field Documentation

- ***uint32\_t FLASH\_EraseInitTypeDef::TypeErase***  
TypeErase: Mass erase or page erase. This parameter can be a value of [\*\*FLASHEx\\_Type\\_Erase\*\*](#)
- ***uint32\_t FLASH\_EraseInitTypeDef::PageAddress***  
PageAddress: Initial FLASH page address to erase when mass erase is disabled. This parameter must be a number between Min\_Data = FLASH\_BASE and Max\_Data = FLASH\_BANK1\_END
- ***uint32\_t FLASH\_EraseInitTypeDef::NbPages***  
NbPages: Number of pages to be erased. This parameter must be a value between Min\_Data = 1 and Max\_Data = (max number of pages - value of initial page)

#### 20.1.2 FLASH\_OBProgramInitTypeDef

##### Data Fields

- *uint32\_t OptionType*
- *uint32\_t WRPState*
- *uint32\_t WRPPage*
- *uint8\_t RDPLevel*
- *uint8\_t USERConfig*
- *uint32\_t DATAAddress*
- *uint8\_t DATAData*

##### Field Documentation

- ***uint32\_t FLASH\_OBProgramInitTypeDef::OptionType***  
OptionType: Option byte to be configured. This parameter can be a value of [\*\*FLASHEx\\_OB\\_Type\*\*](#)
- ***uint32\_t FLASH\_OBProgramInitTypeDef::WRPState***  
WRPState: Write protection activation or deactivation. This parameter can be a value of [\*\*FLASHEx\\_OB\\_WRP\\_State\*\*](#)
- ***uint32\_t FLASH\_OBProgramInitTypeDef::WRPPage***  
WRPPage: specifies the page(s) to be write protected. This parameter can be a value of [\*\*FLASHEx\\_OB\\_Write\\_Protection\*\*](#)
- ***uint8\_t FLASH\_OBProgramInitTypeDef::RDPLevel***  
RDPLevel: Set the read protection level.. This parameter can be a value of [\*\*FLASHEx\\_OB\\_Read\\_Protection\*\*](#)
- ***uint8\_t FLASH\_OBProgramInitTypeDef::USERConfig***  
USERConfig: Program the FLASH User Option Byte: IWDG / STOP / STDBY / BOOT1 / VDDA\_ANALOG / SRAM\_PARITY / SDADC12\_VDD\_MONITOR. This parameter can be a combination of [\*\*FLASHEx\\_OB\\_IWatchdog\*\*](#).

- FLASHEx\_OB\_nRST\_STOP, FLASHEx\_OB\_nRST\_STDBY,  
 FLASHEx\_OB\_BOOT1, FLASHEx\_OB\_VDDA\_Analog\_Monitoring,  
 FLASHEx\_OB\_RAM\_Parity\_Check\_Enable.*
- ***uint32\_t FLASH\_OBProgramInitTypeDef::DATAAddress***  
 DATAAddress: Address of the option byte DATA to be programmed This parameter can be a value of *FLASHEx\_OB\_Data\_Address*
  - ***uint8\_t FLASH\_OBProgramInitTypeDef::DATAData***  
 DATAData: Data to be stored in the option byte DATA This parameter must be a number between Min\_Data = 0x00 and Max\_Data = 0xFFU

## 20.2 FLASHEx Firmware driver API description

### 20.2.1 FLASH Erasing Programming functions

The FLASH Memory Erasing functions, includes the following functions:

- *@ref HAL\_FLASHEx\_Erase*: return only when erase has been done
- *@ref HAL\_FLASHEx\_Erase\_IT*: end of erase is done when *@ref HAL\_FLASH\_EndOfOperationCallback* is called with parameter 0xFFFFFFFF

Any operation of erase should follow these steps:

1. Call the *@ref HAL\_FLASH\_Unlock()* function to enable the flash control register and program memory access.
2. Call the desired function to erase page.
3. Call the *@ref HAL\_FLASH\_Lock()* to disable the flash program memory access (recommended to protect the FLASH memory against possible unwanted operation).

This section contains the following APIs:

- ***HAL\_FLASHEx\_Erase()***
- ***HAL\_FLASHEx\_Erase\_IT()***

### 20.2.2 Option Bytes Programming functions

This subsection provides a set of functions allowing to control the FLASH option bytes operations.

This section contains the following APIs:

- ***HAL\_FLASHEx\_OBErase()***
- ***HAL\_FLASHEx\_OBProgram()***
- ***HAL\_FLASHEx\_OBGetConfig()***
- ***HAL\_FLASHEx\_OBGetUserData()***

### 20.2.3 Detailed description of functions

#### HAL\_FLASHEx\_Erase

Function name      **HAL\_StatusTypeDef HAL\_FLASHEx\_Erase  
 (FLASH\_EraselInitTypeDef \* pEraselInit, uint32\_t \* PageError)**

Function description      Perform a mass erase or erase the specified FLASH memory pages.

Parameters     
 

- **pEraselInit**: pointer to an *FLASH\_EraselInitTypeDef* structure that contains the configuration information for the erasing.
- **PageError**: pointer to variable that contains the configuration information on faulty page in case of error (0xFFFFFFFF)

---

## 21 HAL GPIO Generic Driver

### 21.1 GPIO Firmware driver registers structures

#### 21.1.1 GPIO\_InitTypeDef

##### Data Fields

- *uint32\_t Pin*
- *uint32\_t Mode*
- *uint32\_t Pull*
- *uint32\_t Speed*
- *uint32\_t Alternate*

##### Field Documentation

- ***uint32\_t GPIO\_InitTypeDef::Pin***  
Specifies the GPIO pins to be configured. This parameter can be any value of [\*\*GPIO\\_pins\*\*](#)
- ***uint32\_t GPIO\_InitTypeDef::Mode***  
Specifies the operating mode for the selected pins. This parameter can be a value of [\*\*GPIO\\_mode\*\*](#)
- ***uint32\_t GPIO\_InitTypeDef::Pull***  
Specifies the Pull-up or Pull-Down activation for the selected pins. This parameter can be a value of [\*\*GPIO\\_pull\*\*](#)
- ***uint32\_t GPIO\_InitTypeDef::Speed***  
Specifies the speed for the selected pins. This parameter can be a value of [\*\*GPIO\\_speed\*\*](#)
- ***uint32\_t GPIO\_InitTypeDef::Alternate***  
Peripheral to be connected to the selected pins This parameter can be a value of [\*\*GPIOEx\\_Alternate\\_function\\_selection\*\*](#)

### 21.2 GPIO Firmware driver API description

#### 21.2.1 GPIO Peripheral features

- Each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:
  - Input mode
  - Analog mode
  - Output mode
  - Alternate function mode
  - External interrupt/event lines
- During and just after reset, the alternate functions and external interrupt lines are not active and the I/O ports are configured in input floating mode.
- All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not.
- In Output or Alternate mode, each IO can be configured on open-drain or push-pull type and the IO speed can be selected depending on the VDD value.
- The microcontroller IO pins are connected to onboard peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an IO pin at a time. In this way, there can be no conflict between peripherals sharing the same IO pin.

- All ports have external interrupt/event capability. To use external interrupt lines, the port must be configured in input mode. All available GPIO pins are connected to the 16 external interrupt/event lines from EXTI0 to EXTI15.
- The external interrupt/event controller consists of up to 23 edge detectors (16 lines are connected to GPIO) for generating event/interrupt requests (each input line can be independently configured to select the type (interrupt or event) and the corresponding trigger event (rising or falling or both). Each line can also be masked independently).

### 21.2.2 How to use this driver

1. Enable the GPIO AHB clock using the following function:  
`__HAL_RCC_GPIOx_CLK_ENABLE()`.
2. Configure the GPIO pin(s) using `HAL_GPIO_Init()`.
  - Configure the IO mode using "Mode" member from `GPIO_InitTypeDef` structure
  - Activate Pull-up, Pull-down resistor using "Pull" member from `GPIO_InitTypeDef` structure.
  - In case of Output or alternate function mode selection: the speed is configured through "Speed" member from `GPIO_InitTypeDef` structure.
  - In alternate mode is selection, the alternate function connected to the IO is configured through "Alternate" member from `GPIO_InitTypeDef` structure.
  - Analog mode is required when a pin is to be used as ADC channel or DAC output.
  - In case of external interrupt/event selection the "Mode" member from `GPIO_InitTypeDef` structure select the type (interrupt or event) and the corresponding trigger event (rising or falling or both).
3. In case of external interrupt/event mode selection, configure NVIC IRQ priority mapped to the EXTI line using `HAL_NVIC_SetPriority()` and enable it using `HAL_NVIC_EnableIRQ()`.
4. To get the level of a pin configured in input mode use `HAL_GPIO_ReadPin()`.
5. To set/reset the level of a pin configured in output mode use `HAL_GPIO_WritePin()`/`HAL_GPIO_TogglePin()`.
6. To lock pin configuration until next reset use `HAL_GPIO_LockPin()`.
7. During and just after reset, the alternate functions are not active and the GPIO pins are configured in input floating mode (except JTAG pins).
8. The LSE oscillator pins OSC32\_IN and OSC32\_OUT can be used as general purpose (PC14 and PC15U, respectively) when the LSE oscillator is off. The LSE has priority over the GPIO function.
9. The HSE oscillator pins OSC\_IN/OSC\_OUT can be used as general purpose PF0 and PF1, respectively, when the HSE oscillator is off. The HSE has priority over the GPIO function.

### 21.2.3 Initialization and de-initialization functions

This section contains the following APIs:

- `HAL_GPIO_Init()`
- `HAL_GPIO_DeInit()`

### 21.2.4 IO operation functions

This section contains the following APIs:

- `HAL_GPIO_ReadPin()`
- `HAL_GPIO_WritePin()`
- `HAL_GPIO_TogglePin()`
- `HAL_GPIO_LockPin()`
- `HAL_GPIO_EXTI_IRQHandler()`

- [\*HAL\\_GPIO\\_EXTI\\_Callback\(\)\*](#)

## 21.2.5 Detailed description of functions

### **HAL\_GPIO\_Init**

**21.3 GPIO Firmware driver defines****21.3.1 GPIO*****GPIO Exported Macros*****\_HAL\_GPIO\_EXTI\_GET\_FLAG****Description:**

- Check whether the specified EXTI line flag is set or not.

**Parameters:**

- \_EXTI\_LINE\_: specifies the EXTI line flag to check. This parameter can be GPIO\_PIN\_x where x can be(0..15)

**Return value:**

- The: new state of \_EXTI\_LINE\_ (SET or RESET).

**\_HAL\_GPIO\_EXTI\_CLEAR\_FLAG****Description:**

- Clear the EXTI's line pending flags.

**Parameters:**

- \_EXTI\_LINE\_: specifies the EXTI lines flags to clear. This parameter can be any combination of GPIO\_PIN\_x where x can be (0..15)

**Return value:**

- None

**\_HAL\_GPIO\_EXTI\_GET\_IT****Description:**

- Check whether the specified EXTI line is asserted or not.

**Parameters:**

- \_EXTI\_LINE\_: specifies the EXTI line to check. This parameter can be GPIO\_PIN\_x where x can be(0..15)

**Return value:**

- The: new state of \_EXTI\_LINE\_ (SET or RESET).

[\\_\\_HAL\\_GPIO\\_EXTI\\_CLEAR\\_IT](#)**Description:**

- Clear the EXTI's line pending bits.

**Parameters:**

- \_\_EXTI\_LINE\_\_: specifies the EXTI lines to clear. This parameter can be any combination of GPIO\_PIN\_x where x can be (0..15)

**Return value:**

- None

[\\_\\_HAL\\_GPIO\\_EXTI\\_GENERATE\\_SWIT](#)**Description:**

- Generate a Software interrupt on selected EXTI line.

**Parameters:**

- \_\_EXTI\_LINE\_\_: specifies the EXTI line to check. This parameter can be GPIO\_PIN\_x where x can be(0..15)

**Return value:**

- None

## 23 HAL HRTIM Generic Driver

### 23.1 HRTIM Firmware driver registers structures

#### 23.1.1 HRTIM\_InitTypeDef

##### Data Fields

- *uint32\_t HRTIMInterruptRequests*
- *uint32\_t SyncOptions*
- *uint32\_t SyncInputSource*
- *uint32\_t SyncOutputSource*
- *uint32\_t SyncOutputPolarity*

##### Field Documentation

- *uint32\_t HRTIM\_InitTypeDef::HRTIMInterruptRequests*  
Specifies which interrupts requests must enabled for the HRTIM instance. This parameter can be any combination of [\*HRTIM\\_Common Interrupt Enable\*](#)
- *uint32\_t HRTIM\_InitTypeDef::SyncOptions*  
Specifies how the HRTIM instance handles the external synchronization signals. The HRTIM instance can be configured to act as a slave (waiting for a trigger to be synchronized) or a master (generating a synchronization signal) or both. This parameter can be a combination of [\*HRTIM\\_Synchronization Options\*](#).
- *uint32\_t HRTIM\_InitTypeDef::SyncInputSource*  
Specifies the external synchronization input source (significant only when the HRTIM instance is configured as a slave). This parameter can be a value of [\*HRTIM\\_Synchronization Input Source\*](#).
- *uint32\_t HRTIM\_InitTypeDef::SyncOutputSource*  
Specifies the source and event to be sent on the external synchronization outputs (significant only when the HRTIM instance is configured as a master). This parameter can be a value of [\*HRTIM\\_Synchronization Output Source\*](#)
- *uint32\_t HRTIM\_InitTypeDef::SyncOutputPolarity*  
Specifies the conditioning of the event to be sent on the external synchronization outputs (significant only when the HRTIM instance is configured as a master). This parameter can be a value of [\*HRTIM\\_Synchronization Output Polarity\*](#)

#### 23.1.2 HRTIM\_TimerParamTypeDef

##### Data Fields

- *uint32\_t CaptureTrigger1*
- *uint32\_t CaptureTrigger2*
- *uint32\_t InterruptRequests*
- *uint32\_t DMARequests*
- *uint32\_t DMASrcAddress*
- *uint32\_t DMADstAddress*
- *uint32\_t DMASize*

##### Field Documentation

- *uint32\_t HRTIM\_TimerParamTypeDef::CaptureTrigger1*  
Event(s) triggering capture unit 1. When the timer operates in Simple mode, this parameter can be a value of [\*HRTIM\\_External\\_Event\\_Channels\*](#). When the timer

- operates in Waveform mode, this parameter can be a combination of [\*\*HRTIM\\_Capture\\_Unit\\_Trigger\*\*](#).
- ***uint32\_t HRTIM\_TimerParamTypeDef::CaptureTrigger2***  
Event(s) triggering capture unit 2. When the timer operates in Simple mode, this parameter can be a value of [\*\*HRTIM\\_External\\_Event\\_Channels\*\*](#). When the timer operates in Waveform mode, this parameter can be a combination of [\*\*HRTIM\\_Capture\\_Unit\\_Trigger\*\*](#).
- ***uint32\_t HRTIM\_TimerParamTypeDef::InterruptRequests***  
Interrupts requests enabled for the timer.
- ***uint32\_t HRTIM\_TimerParamTypeDef::DMARequests***  
DMA requests enabled for the timer.
- ***uint32\_t HRTIM\_TimerParamTypeDef::DMASrcAddress***  
Address of the source address of the DMA transfer.
- ***uint32\_t HRTIM\_TimerParamTypeDef::DMADstAddress***  
Address of the destination address of the DMA transfer.
- ***uint32\_t HRTIM\_TimerParamTypeDef::DMASize***  
Size of the DMA transfer

### 23.1.3 [\\_\\_HRTIM\\_HandleTypeDef](#)

#### Data Fields

- ***HRTIM\_TypeDef \* Instance***
- ***HRTIM\_InitTypeDef Init***
- ***HRTIM\_TimerParamTypeDef TimerParam***
- ***HAL\_LockTypeDef Lock***
- ***\_IO HAL\_HRTIM\_StateTypeDef State***
- ***DMA\_HandleTypeDef \* hdmaMaster***
- ***DMA\_HandleTypeDef \* hdmaTimerA***
- ***DMA\_HandleTypeDef \* hdmaTimerB***
- ***DMA\_HandleTypeDef \* hdmaTimerC***
- ***DMA\_HandleTypeDef \* hdmaTimerD***
- ***DMA\_HandleTypeDef \* hdmaTimerE***

#### Field Documentation

- ***HRTIM\_TypeDef\* \_\_HRTIM\_HandleTypeDef::Instance***  
Register base address
- ***HRTIM\_InitTypeDef \_\_HRTIM\_HandleTypeDef::Init***  
HRTIM required parameters
- ***HRTIM\_TimerParamTypeDef \_\_HRTIM\_HandleTypeDef::TimerParam[MAX\_HRTIM\_TIMER]***  
HRTIM timers - including the master - parameters
- ***HAL\_LockTypeDef \_\_HRTIM\_HandleTypeDef::Lock***  
Locking object
- ***\_IO HAL\_HRTIM\_StateTypeDef \_\_HRTIM\_HandleTypeDef::State***  
HRTIM communication state
- ***DMA\_HandleTypeDef\* \_\_HRTIM\_HandleTypeDef::hdmaMaster***  
Master timer DMA handle parameters
- ***DMA\_HandleTypeDef\* \_\_HRTIM\_HandleTypeDef::hdmaTimerA***  
Timer A DMA handle parameters
- ***DMA\_HandleTypeDef\* \_\_HRTIM\_HandleTypeDef::hdmaTimerB***  
Timer B DMA handle parameters
- ***DMA\_HandleTypeDef\* \_\_HRTIM\_HandleTypeDef::hdmaTimerC***  
Timer C DMA handle parameters

- **DMA\_HandleTypeDef\* \_\_HRTIM\_HandleTypeDef::hdmaTimerD**  
Timer D DMA handle parameters
- **DMA\_HandleTypeDef\* \_\_HRTIM\_HandleTypeDef::hdmaTimerE**  
Timer E DMA handle parameters

### 23.1.4 HRTIM\_TimeBaseCfgTypeDef

#### Data Fields

- **uint32\_t Period**
- **uint32\_t RepetitionCounter**
- **uint32\_t PrescalerRatio**
- **uint32\_t Mode**

#### Field Documentation

- **uint32\_t HRTIM\_TimeBaseCfgTypeDef::Period**  
Specifies the timer period. The period value must be above 3 periods of the fHRTIM clock. Maximum value is = 0xFFFFFU
- **uint32\_t HRTIM\_TimeBaseCfgTypeDef::RepetitionCounter**  
Specifies the timer repetition period. This parameter must be a number between Min\_Data = 0x00 and Max\_Data = 0xFF.
- **uint32\_t HRTIM\_TimeBaseCfgTypeDef::PrescalerRatio**  
Specifies the timer clock prescaler ratio. This parameter can be any value of [HRTIM\\_Prescaler\\_Ratio](#)
- **uint32\_t HRTIM\_TimeBaseCfgTypeDef::Mode**  
Specifies the counter operating mode. This parameter can be any value of [HRTIM\\_Counter\\_Operating\\_Mode](#)

### 23.1.5 HRTIM\_SimpleOCChannelCfgTypeDef

#### Data Fields

- **uint32\_t Mode**
- **uint32\_t Pulse**
- **uint32\_t Polarity**
- **uint32\_t IdleLevel**

#### Field Documentation

- **uint32\_t HRTIM\_SimpleOCChannelCfgTypeDef::Mode**  
Specifies the output compare mode (toggle, active, inactive). This parameter can be any value of [HRTIM\\_Simple\\_OC\\_Mode](#)
- **uint32\_t HRTIM\_SimpleOCChannelCfgTypeDef::Pulse**  
Specifies the compare value to be loaded into the Compare Register. The compare value must be above or equal to 3 periods of the fHRTIM clock
- **uint32\_t HRTIM\_SimpleOCChannelCfgTypeDef::Polarity**  
Specifies the output polarity. This parameter can be any value of [HRTIM\\_Output\\_Polarity](#)
- **uint32\_t HRTIM\_SimpleOCChannelCfgTypeDef::IdleLevel**  
Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of [HRTIM\\_Output\\_IDLE\\_Level](#)

### 23.1.6 HRTIM\_SimplePWMChannelCfgTypeDef

#### Data Fields

- **uint32\_t Pulse**
- **uint32\_t Polarity**

- *uint32\_t IdleLevel*

#### Field Documentation

- *uint32\_t HRTIM\_SimplePWMChannelCfgTypeDef::Pulse*  
Specifies the compare value to be loaded into the Compare Register. The compare value must be above or equal to 3 periods of the fHRTIM clock
- *uint32\_t HRTIM\_SimplePWMChannelCfgTypeDef::Polarity*  
Specifies the output polarity. This parameter can be any value of [HRTIM\\_Output\\_Polarity](#)
- *uint32\_t HRTIM\_SimplePWMChannelCfgTypeDef::IdleLevel*  
Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of [HRTIM\\_Output\\_IDLE\\_Level](#)

### 23.1.7 HRTIM\_SimpleCaptureChannelCfgTypeDef

#### Data Fields

- *uint32\_t Event*
- *uint32\_t EventPolarity*
- *uint32\_t EventSensitivity*
- *uint32\_t EventFilter*

#### Field Documentation

- *uint32\_t HRTIM\_SimpleCaptureChannelCfgTypeDef::Event*  
Specifies the external event triggering the capture. This parameter can be any 'EEVx' value of [HRTIM\\_External\\_Event\\_Channels](#)
- *uint32\_t HRTIM\_SimpleCaptureChannelCfgTypeDef::EventPolarity*  
Specifies the polarity of the external event (in case of level sensitivity). This parameter can be a value of [HRTIM\\_External\\_Event\\_Polarity](#)
- *uint32\_t HRTIM\_SimpleCaptureChannelCfgTypeDef::EventSensitivity*  
Specifies the sensitivity of the external event. This parameter can be a value of [HRTIM\\_External\\_Event\\_Sensitivity](#)
- *uint32\_t HRTIM\_SimpleCaptureChannelCfgTypeDef::EventFilter*  
Defines the frequency used to sample the External Event and the length of the digital filter. This parameter can be a value of [HRTIM\\_External\\_Event\\_Filter](#)

### 23.1.8 HRTIM\_SimpleOnePulseChannelCfgTypeDef

#### Data Fields

- *uint32\_t Pulse*
- *uint32\_t OutputPolarity*
- *uint32\_t OutputIdleLevel*
- *uint32\_t Event*
- *uint32\_t EventPolarity*
- *uint32\_t EventSensitivity*
- *uint32\_t EventFilter*

#### Field Documentation

- *uint32\_t HRTIM\_SimpleOnePulseChannelCfgTypeDef::Pulse*  
Specifies the compare value to be loaded into the Compare Register. The compare value must be above or equal to 3 periods of the fHRTIM clock
- *uint32\_t HRTIM\_SimpleOnePulseChannelCfgTypeDef::OutputPolarity*  
Specifies the output polarity. This parameter can be any value of [HRTIM\\_Output\\_Polarity](#)

- ***uint32\_t HRTIM\_SimpleOnePulseChannelCfgTypeDef::OutputIdleLevel***  
Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of [\*HRTIM\\_Output\\_IDLE\\_Level\*](#)
- ***uint32\_t HRTIM\_SimpleOnePulseChannelCfgTypeDef::Event***  
Specifies the external event triggering the pulse generation. This parameter can be any 'EEVx' value of [\*HRTIM\\_External\\_Event\\_Channels\*](#)
- ***uint32\_t HRTIM\_SimpleOnePulseChannelCfgTypeDef::EventPolarity***  
Specifies the polarity of the external event (in case of level sensitivity). This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Polarity\*](#)
- ***uint32\_t HRTIM\_SimpleOnePulseChannelCfgTypeDef::EventSensitivity***  
Specifies the sensitivity of the external event. This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Sensitivity\*](#).
- ***uint32\_t HRTIM\_SimpleOnePulseChannelCfgTypeDef::EventFilter***  
Defines the frequency used to sample the External Event and the length of the digital filter. This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Filter\*](#)

### 23.1.9 HRTIM\_TimerCfgTypeDef

#### Data Fields

- ***uint32\_t InterruptRequests***
- ***uint32\_t DMARequests***
- ***uint32\_t DMASrcAddress***
- ***uint32\_t DMADstAddress***
- ***uint32\_t DMASize***
- ***uint32\_t HalfModeEnable***
- ***uint32\_t StartOnSync***
- ***uint32\_t ResetOnSync***
- ***uint32\_t DACSynchro***
- ***uint32\_t PreloadEnable***
- ***uint32\_t UpdateGating***
- ***uint32\_t BurstMode***
- ***uint32\_t RepetitionUpdate***
- ***uint32\_t PushPull***
- ***uint32\_t FaultEnable***
- ***uint32\_t FaultLock***
- ***uint32\_t DeadTimeInsertion***
- ***uint32\_t DelayedProtectionMode***
- ***uint32\_t UpdateTrigger***
- ***uint32\_t ResetTrigger***
- ***uint32\_t ResetUpdate***

#### Field Documentation

- ***uint32\_t HRTIM\_TimerCfgTypeDef::InterruptRequests***  
Relevant for all HRTIM timers, including the master. Specifies which interrupts requests must be enabled for the timer. This parameter can be any combination of [\*HRTIM\\_Master\\_Interrupt\\_Enable\*](#) or [\*HRTIM\\_Timing\\_Unit\\_Interrupt\\_Enable\*](#)
- ***uint32\_t HRTIM\_TimerCfgTypeDef::DMARequests***  
Relevant for all HRTIM timers, including the master. Specifies which DMA requests must be enabled for the timer. This parameter can be any combination of [\*HRTIM\\_Master\\_DMA\\_Request\\_Enable\*](#) or [\*HRTIM\\_Timing\\_Unit\\_DMA\\_Request\\_Enable\*](#)
- ***uint32\_t HRTIM\_TimerCfgTypeDef::DMASrcAddress***  
Relevant for all HRTIM timers, including the master. Specifies the address of the source address of the DMA transfer

- **`uint32_t HRTIM_TimerCfgTypeDef::DMADstAddress`**  
Relevant for all HRTIM timers, including the master. Specifies the address of the destination address of the DMA transfer
- **`uint32_t HRTIM_TimerCfgTypeDef::DMASize`**  
Relevant for all HRTIM timers, including the master. Specifies the size of the DMA transfer
- **`uint32_t HRTIM_TimerCfgTypeDef::HalfModeEnable`**  
Relevant for all HRTIM timers, including the master. Specifies whether or not half mode is enabled. This parameter can be any value of [`HRTIM\_Half\_Mode\_Enable`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::StartOnSync`**  
Relevant for all HRTIM timers, including the master. Specifies whether or not timer is reset by a rising edge on the synchronization input (when enabled). This parameter can be any value of [`HRTIM\_Start\_On\_Sync\_Input\_Event`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::ResetOnSync`**  
Relevant for all HRTIM timers, including the master. Specifies whether or not timer is reset by a rising edge on the synchronization input (when enabled). This parameter can be any value of [`HRTIM\_Reset\_On\_Sync\_Input\_Event`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::DACSynchro`**  
Relevant for all HRTIM timers, including the master. Indicates whether or not a DAC synchronization event is generated. This parameter can be any value of [`HRTIM\_DAC\_Synchronization`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::PreloadEnable`**  
Relevant for all HRTIM timers, including the master. Specifies whether or not register preload is enabled. This parameter can be any value of [`HRTIM\_Register\_Preload\_Enable`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::UpdateGating`**  
Relevant for all HRTIM timers, including the master. Specifies how the update occurs with respect to a burst DMA transaction or update enable inputs (Slave timers only). This parameter can be any value of [`HRTIM\_Update\_Gating`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::BurstMode`**  
Relevant for all HRTIM timers, including the master. Specifies how the timer behaves during a burst mode operation. This parameter can be any value of [`HRTIM\_Timer\_Burst\_Mode`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::RepetitionUpdate`**  
Relevant for all HRTIM timers, including the master. Specifies whether or not registers update is triggered by the repetition event. This parameter can be any value of [`HRTIM\_Timer\_Repetition\_Update`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::PushPull`**  
Relevant for Timer A to Timer E. Specifies whether or not the push-pull mode is enabled. This parameter can be any value of [`HRTIM\_Timer\_Push\_Pull\_Mode`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::FaultEnable`**  
Relevant for Timer A to Timer E. Specifies which fault channels are enabled for the timer. This parameter can be a combination of [`HRTIM\_Timer\_Fault\_Enabling`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::FaultLock`**  
Relevant for Timer A to Timer E. Specifies whether or not fault enabling status is write protected. This parameter can be a value of [`HRTIM\_Timer\_Fault\_Lock`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::DeadTimeInsertion`**  
Relevant for Timer A to Timer E. Specifies whether or not dead-time insertion is enabled for the timer. This parameter can be a value of [`HRTIM\_Timer\_Deadtime\_Insertion`](#)
- **`uint32_t HRTIM_TimerCfgTypeDef::DelayedProtectionMode`**  
Relevant for Timer A to Timer E. Specifies the delayed protection mode. This parameter can be a value of [`HRTIM\_Timer\_Delayed\_Protection\_Mode`](#)

- ***uint32\_t HRTIM\_TimerCfgTypeDef::UpdateTrigger***  
Relevant for Timer A to Timer E. Specifies source(s) triggering the timer registers update. This parameter can be a combination of [\*HRTIM\\_Timer\\_Update\\_Trigger\*](#)
- ***uint32\_t HRTIM\_TimerCfgTypeDef::ResetTrigger***  
Relevant for Timer A to Timer E. Specifies source(s) triggering the timer counter reset. This parameter can be a combination of [\*HRTIM\\_Timer\\_Reset\\_Trigger\*](#)
- ***uint32\_t HRTIM\_TimerCfgTypeDef::ResetUpdate***  
Relevant for Timer A to Timer E. Specifies whether or not registers update is triggered when the timer counter is reset. This parameter can be a value of [\*HRTIM\\_Timer\\_Reset\\_Update\*](#)

### 23.1.10 HRTIM\_CompareCfgTypeDef

#### Data Fields

- ***uint32\_t CompareValue***
- ***uint32\_t AutoDelayedMode***
- ***uint32\_t AutoDelayedTimeout***

#### Field Documentation

- ***uint32\_t HRTIM\_CompareCfgTypeDef::CompareValue***  
Specifies the compare value of the timer compare unit. The minimum value must be greater than or equal to 3 periods of the fHRTIM clock. The maximum value must be less than or equal to 0xFFFFFU - 1 periods of the fHRTIM clock
- ***uint32\_t HRTIM\_CompareCfgTypeDef::AutoDelayedMode***  
Specifies the auto delayed mode for compare unit 2 or 4. This parameter can be a value of [\*HRTIM\\_Compare\\_Unit\\_Auto\\_Delayed\\_Mode\*](#)
- ***uint32\_t HRTIM\_CompareCfgTypeDef::AutoDelayedTimeout***  
Specifies compare value for timing unit 1 or 3 when auto delayed mode with time out is selected. CompareValue + AutoDelayedTimeout must be less than 0xFFFFU

### 23.1.11 HRTIM\_CaptureCfgTypeDef

#### Data Fields

- ***uint32\_t Trigger***

#### Field Documentation

- ***uint32\_t HRTIM\_CaptureCfgTypeDef::Trigger***  
Specifies source(s) triggering the capture. This parameter can be a combination of [\*HRTIM\\_Capture\\_Unit\\_Trigger\*](#)

### 23.1.12 HRTIM\_OutputCfgTypeDef

#### Data Fields

- ***uint32\_t Polarity***
- ***uint32\_t SetSource***
- ***uint32\_t ResetSource***
- ***uint32\_t IdleMode***
- ***uint32\_t IdleLevel***
- ***uint32\_t FaultLevel***
- ***uint32\_t ChopperModeEnable***
- ***uint32\_t BurstModeEntryDelayed***

**Field Documentation**

- ***uint32\_t HRTIM\_OutputCfgTypeDef::Polarity***  
Specifies the output polarity. This parameter can be any value of [\*HRTIM\\_Output\\_Polarity\*](#)
- ***uint32\_t HRTIM\_OutputCfgTypeDef::SetSource***  
Specifies the event(s) transitioning the output from its inactive level to its active level. This parameter can be a combination of [\*HRTIM\\_Output\\_Set\\_Source\*](#)
- ***uint32\_t HRTIM\_OutputCfgTypeDef::ResetSource***  
Specifies the event(s) transitioning the output from its active level to its inactive level. This parameter can be a combination of [\*HRTIM\\_Output\\_Reset\\_Source\*](#)
- ***uint32\_t HRTIM\_OutputCfgTypeDef::IdleMode***  
Specifies whether or not the output is affected by a burst mode operation. This parameter can be any value of [\*HRTIM\\_Output\\_Idle\\_Mode\*](#)
- ***uint32\_t HRTIM\_OutputCfgTypeDef::IdleLevel***  
Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of [\*HRTIM\\_Output\\_IDLE\\_Level\*](#)
- ***uint32\_t HRTIM\_OutputCfgTypeDef::FaultLevel***  
Specifies whether the output level is active or inactive when in FAULT state. This parameter can be any value of [\*HRTIM\\_Output\\_FAULT\\_Level\*](#)
- ***uint32\_t HRTIM\_OutputCfgTypeDef::ChopperModeEnable***  
Indicates whether or not the chopper mode is enabled. This parameter can be any value of [\*HRTIM\\_Output\\_Chopper\\_Mode\\_Enable\*](#)
- ***uint32\_t HRTIM\_OutputCfgTypeDef::BurstModeEntryDelayed***  
Indicates whether or not dead-time is inserted when entering the IDLE state during a burst mode operation. This parameter can be any value of [\*HRTIM\\_Output\\_Burst\\_Mode\\_Entry\\_Delayed\*](#)

**23.1.13 HRTIM\_TimerEventFilteringCfgTypeDef****Data Fields**

- ***uint32\_t Filter***
- ***uint32\_t Latch***

**Field Documentation**

- ***uint32\_t HRTIM\_TimerEventFilteringCfgTypeDef::Filter***  
Specifies the type of event filtering within the timing unit. This parameter can be a value of [\*HRTIM\\_Timer\\_External\\_Event\\_Filter\*](#)
- ***uint32\_t HRTIM\_TimerEventFilteringCfgTypeDef::Latch***  
Specifies whether or not the signal is latched. This parameter can be a value of [\*HRTIM\\_Timer\\_External\\_Event\\_Latch\*](#)

**23.1.14 HRTIM\_DeadTimeCfgTypeDef****Data Fields**

- ***uint32\_t Prescaler***
- ***uint32\_t RisingValue***
- ***uint32\_t RisingSign***
- ***uint32\_t RisingLock***
- ***uint32\_t RisingSignLock***
- ***uint32\_t FallingValue***
- ***uint32\_t FallingSign***
- ***uint32\_t FallingLock***
- ***uint32\_t FallingSignLock***

**Field Documentation**

- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::Prescaler***  
Specifies the Deadtime Prescaler. This parameter can be a value of [\*\*HRTIM\\_Deadtime\\_Prescaler\\_Ratio\*\*](#)
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::RisingValue***  
Specifies the Deadtime following a rising edge. This parameter can be a number between 0x0 and 0x1FFU
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::RisingSign***  
Specifies whether the deadtime is positive or negative on rising edge. This parameter can be a value of [\*\*HRTIM\\_Deadtime\\_Rising\\_Sign\*\*](#)
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::RisingLock***  
Specifies whether or not deadtime rising settings (value and sign) are write protected. This parameter can be a value of [\*\*HRTIM\\_Deadtime\\_Rising\\_Lock\*\*](#)
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::RisingSignLock***  
Specifies whether or not deadtime rising sign is write protected. This parameter can be a value of [\*\*HRTIM\\_Deadtime\\_Rising\\_Sign\\_Lock\*\*](#)
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::FallingValue***  
Specifies the Deadtime following a falling edge. This parameter can be a number between 0x0 and 0x1FFU
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::FallingSign***  
Specifies whether the deadtime is positive or negative on falling edge. This parameter can be a value of [\*\*HRTIM\\_Deadtime\\_Falling\\_Sign\*\*](#)
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::FallingLock***  
Specifies whether or not deadtime falling settings (value and sign) are write protected. This parameter can be a value of [\*\*HRTIM\\_Deadtime\\_Falling\\_Lock\*\*](#)
- ***uint32\_t HRTIM\_DeadTimeCfgTypeDef::FallingSignLock***  
Specifies whether or not deadtime falling sign is write protected. This parameter can be a value of [\*\*HRTIM\\_Deadtime\\_Falling\\_Sign\\_Lock\*\*](#)

**23.1.15 HRTIM\_ChopperModeCfgTypeDef****Data Fields**

- ***uint32\_t CarrierFreq***
- ***uint32\_t DutyCycle***
- ***uint32\_t StartPulse***

**Field Documentation**

- ***uint32\_t HRTIM\_ChopperModeCfgTypeDef::CarrierFreq***  
Specifies the Timer carrier frequency value. This parameter can be a value of [\*\*HRTIM\\_Chopper\\_Frequency\*\*](#)
- ***uint32\_t HRTIM\_ChopperModeCfgTypeDef::DutyCycle***  
Specifies the Timer chopper duty cycle value. This parameter can be a value of [\*\*HRTIM\\_Chopper\\_Duty\\_Cycle\*\*](#)
- ***uint32\_t HRTIM\_ChopperModeCfgTypeDef::StartPulse***  
Specifies the Timer pulse width value. This parameter can be a value of [\*\*HRTIM\\_Chopper\\_Start\\_Pulse\\_Width\*\*](#)

**23.1.16 HRTIM\_EventCfgTypeDef****Data Fields**

- ***uint32\_t Source***
- ***uint32\_t Polarity***
- ***uint32\_t Sensitivity***
- ***uint32\_t Filter***

- *uint32\_t FastMode*

#### Field Documentation

- *uint32\_t HRTIM\_EventCfgTypeDef::Source*

Identifies the source of the external event. This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Sources\*](#)

- *uint32\_t HRTIM\_EventCfgTypeDef::Polarity*

Specifies the polarity of the external event (in case of level sensitivity). This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Polarity\*](#)

- *uint32\_t HRTIM\_EventCfgTypeDef::Sensitivity*

Specifies the sensitivity of the external event. This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Sensitivity\*](#)

- *uint32\_t HRTIM\_EventCfgTypeDef::Filter*

Defines the frequency used to sample the External Event and the length of the digital filter. This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Filter\*](#)

- *uint32\_t HRTIM\_EventCfgTypeDef::FastMode*

Indicates whether or not low latency mode is enabled for the external event. This parameter can be a value of [\*HRTIM\\_External\\_Event\\_Fast\\_Mode\*](#)

### 23.1.17 HRTIM\_FaultCfgTypeDef

#### Data Fields

- *uint32\_t Source*
- *uint32\_t Polarity*
- *uint32\_t Filter*
- *uint32\_t Lock*

#### Field Documentation

- *uint32\_t HRTIM\_FaultCfgTypeDef::Source*

Identifies the source of the fault. This parameter can be a value of [\*HRTIM\\_Fault\\_Sources\*](#)

- *uint32\_t HRTIM\_FaultCfgTypeDef::Polarity*

Specifies the polarity of the fault event. This parameter can be a value of [\*HRTIM\\_Fault\\_Polarity\*](#)

- *uint32\_t HRTIM\_FaultCfgTypeDef::Filter*

Defines the frequency used to sample the Fault input and the length of the digital filter. This parameter can be a value of [\*HRTIM\\_Fault\\_Filter\*](#)

- *uint32\_t HRTIM\_FaultCfgTypeDef::Lock*

Indicates whether or not fault programming bits are write protected. This parameter can be a value of [\*HRTIM\\_Fault\\_Lock\*](#)

### 23.1.18 HRTIM\_BurstModeCfgTypeDef

#### Data Fields

- *uint32\_t Mode*
- *uint32\_t ClockSource*
- *uint32\_t Prescaler*
- *uint32\_t PreloadEnable*
- *uint32\_t Trigger*
- *uint32\_t IdleDuration*
- *uint32\_t Period*

**Field Documentation**

- ***uint32\_t HRTIM\_BurstModeCfgTypeDef::Mode***  
Specifies the burst mode operating mode. This parameter can be a value of [\*\*HRTIM\\_Burst\\_Mode\\_Operating\\_Mode\*\*](#)
- ***uint32\_t HRTIM\_BurstModeCfgTypeDef::ClockSource***  
Specifies the burst mode clock source. This parameter can be a value of [\*\*HRTIM\\_Burst\\_Mode\\_Clock\\_Source\*\*](#)
- ***uint32\_t HRTIM\_BurstModeCfgTypeDef::Prescaler***  
Specifies the burst mode prescaler. This parameter can be a value of [\*\*HRTIM\\_Burst\\_Mode\\_Prescaler\*\*](#)
- ***uint32\_t HRTIM\_BurstModeCfgTypeDef::PreloadEnable***  
Specifies whether or not preload is enabled for burst mode related registers (HRTIM\_BMCMPR and HRTIM\_BMPER). This parameter can be a combination of [\*\*HRTIM\\_Burst\\_Mode\\_Register\\_Preload\\_Enable\*\*](#)
- ***uint32\_t HRTIM\_BurstModeCfgTypeDef::Trigger***  
Specifies the event(s) triggering the burst operation. This parameter can be a combination of [\*\*HRTIM\\_Burst\\_Mode\\_Trigger\*\*](#)
- ***uint32\_t HRTIM\_BurstModeCfgTypeDef::IdleDuration***  
Specifies number of periods during which the selected timers are in idle state. This parameter can be a number between 0x0 and 0xFFFF
- ***uint32\_t HRTIM\_BurstModeCfgTypeDef::Period***  
Specifies burst mode repetition period. This parameter can be a number between 0x1 and 0xFFFF

**23.1.19 HRTIM\_ADCTriggerCfgTypeDef****Data Fields**

- ***uint32\_t UpdateSource***
- ***uint32\_t Trigger***

**Field Documentation**

- ***uint32\_t HRTIM\_ADCTriggerCfgTypeDef::UpdateSource***  
Specifies the ADC trigger update source. This parameter can be a combination of [\*\*HRTIM\\_ADC\\_Trigger\\_Update\\_Source\*\*](#)
- ***uint32\_t HRTIM\_ADCTriggerCfgTypeDef::Trigger***  
Specifies the event(s) triggering the ADC conversion. This parameter can be a value of [\*\*HRTIM\\_ADC\\_Trigger\\_Event\*\*](#)

**23.2 HRTIM Firmware driver API description****23.2.1 Simple mode v.s. waveform mode**

The HRTIM HAL API is split into 2 categories:

1. Simple functions: these functions allow for using a HRTIM timer as a general purpose timer with high resolution capabilities. HRTIM simple modes are managed through the set of functions named `HAL_HRTIM_Simple<Function>`. These functions are similar in name and usage to the one defined for the TIM peripheral. When a HRTIM timer operates in simple mode, only a very limited set of HRTIM features are used.  
Following simple modes are proposed:
  - Output compare mode,
  - PWM output mode,
  - Input capture mode,
  - One pulse mode.

2. Waveform functions: These functions allow taking advantage of the HRTIM flexibility to produce numerous types of control signal. When a HRTIM timer operates in waveform mode, all the HRTIM features are accessible without any restriction. HRTIM waveform modes are managed through the set of functions named `HAL_HRTIM_Waveform<Function>`

### 23.2.2 How to use this driver

1. Initialize the HRTIM low level resources by implementing the `HAL_HRTIM_MsplInit()` function:
  - a. Enable the HRTIM clock source using `__HRTIMx_CLK_ENABLE()`
  - b. Connect HRTIM pins to MCU I/Os
    - Enable the clock for the HRTIM GPIOs using the following function:  
`__HAL_RCC_GPIOx_CLK_ENABLE()`
    - Configure these GPIO pins in Alternate Function mode using  
`HAL_GPIO_Init()`
  - c. When using DMA to control data transfer (e.g `HAL_HRTIM_SimpleBaseStart_DMA()`)
    - Enable the DMAx interface clock using `__DMAx_CLK_ENABLE()`
    - Initialize the DMA handle
    - Associate the initialized DMA handle to the appropriate DMA handle of the HRTIM handle using `__HAL_LINKDMA()`
    - Initialize the DMA channel using `HAL_DMA_Init()`
    - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA channel using `HAL_NVIC_SetPriority()` and `HAL_NVIC_EnableIRQ()`
  - d. In case of using interrupt mode (e.g `HAL_HRTIM_SimpleBaseStart_IT()`)
    - Configure the priority and enable the NVIC for the concerned HRTIM interrupt using `HAL_NVIC_SetPriority()` and `HAL_NVIC_EnableIRQ()`
2. Initialize the HRTIM HAL using `HAL_HRTIM_Init()`. The HRTIM configuration structure (field of the HRTIM handle) specifies which global interrupt of whole HRTIM must be enabled (Burst mode period, System fault, Faults). It also contains the HRTIM external synchronization configuration. HRTIM can act as a master (generating a synchronization signal) or as a slave (waiting for a trigger to be synchronized).
3. Start the high resolution unit using `HAL_HRTIM_DLLCalibrationStart()`. DLL calibration is executed periodically and compensate for potential voltage and temperature drifts. DLL calibration period is specified by the `CalibrationRate` argument.
4. HRTIM timers cannot be used until the high resolution unit is ready. This can be checked using `HAL_HRTIM_PollForDLLCalibration()`: this function returns `HAL_OK` if DLL calibration is completed or `HAL_TIMEOUT` if the DLL calibration is still going on when timeout given as argument expires. DLL calibration can also be started in interrupt mode using `HAL_HRTIM_DLLCalibrationStart_IT()`. In that case an interrupt is generated when the DLL calibration is completed. Note that as DLL calibration is executed on a periodic basis an interrupt will be generated at the end of every DLL calibration operation (worst case: one interrupt every 14 micro seconds !).
5. Configure HRTIM resources shared by all HRTIM timers
  - a. Burst Mode Controller:
    - `HAL_HRTIM_BurstModeConfig()`: configures the HRTIM burst mode controller: operating mode (continuous or one-shot mode), clock (source, prescaler) , trigger(s), period, idle duration.
  - b. External Events Conditionning:
    - `HAL_HRTIM_EventConfig()`: configures the conditioning of an external event channel: source, polarity, edge-sensitivity. External event can be used as triggers (timer reset, input capture, burst mode, ADC triggers, delayed

- protection) They can also be used to set or reset timer outputs. Up to 10 event channels are available.
- HAL\_HRTIM\_EventPrescalerConfig(): configures the external event sampling clock (used for digital filtering).
- c. Fault Conditionning:
- HAL\_HRTIM\_FaultConfig(): configures the conditioning of a fault channel: source, polarity, edge-sensitivity. Fault channels are used to disable the outputs in case of an abnormal operation. Up to 5 fault channels are available.
  - HAL\_HRTIM\_FaultPrescalerConfig(): configures the fault sampling clock (used for digital filtering).
  - HAL\_HRTIM\_FaultModeCtl(): Enables or disables fault input(s) circuitry. By default all fault inputs are disabled.
- d. ADC trigger:
- HAL\_HRTIM\_ADCTriggerConfig(): configures the source triggering the update of the ADC trigger register and the ADC trigger. 4 independent triggers are available to start both the regular and the injected sequencers of the 2 ADCs
6. Configure HRTIM timer time base using HAL\_HRTIM\_TimeBaseConfig(). This function must be called whatever the HRTIM timer operating mode is (simple v.s. waveform). It configures mainly:
- a. The HRTIM timer counter operating mode (continuous v.s. one shot)
  - b. The HRTIM timer clock prescaler
  - c. The HRTIM timer period
  - d. The HRTIM timer repetition counter

### If the HRTIM timer operates in simple mode

1. Start or Stop simple timers
  - Simple time base:  
HAL\_HRTIM\_SimpleBaseStart(), HAL\_HRTIM\_SimpleBaseStop(),  
HAL\_HRTIM\_SimpleBaseStart\_IT(), HAL\_HRTIM\_SimpleBaseStop\_IT(),  
HAL\_HRTIM\_SimpleBaseStart\_DMA(), HAL\_HRTIM\_SimpleBaseStop\_DMA().
  - Simple output compare: HAL\_HRTIM\_SimpleOCChannelConfig(),  
HAL\_HRTIM\_SimpleOCStart(), HAL\_HRTIM\_SimpleOCStop(),  
HAL\_HRTIM\_SimpleOCStart\_IT(), HAL\_HRTIM\_SimpleOCStop\_IT(),  
HAL\_HRTIM\_SimpleOCStart\_DMA(), HAL\_HRTIM\_SimpleOCStop\_DMA(),
  - Simple PWM output: HAL\_HRTIM\_SimplePWMChannelConfig(),  
HAL\_HRTIM\_SimplePWMStart(), HAL\_HRTIM\_SimplePWMStop(),  
HAL\_HRTIM\_SimplePWMStart\_IT(), HAL\_HRTIM\_SimplePWMStop\_IT(),  
HAL\_HRTIM\_SimplePWMStart\_DMA(), HAL\_HRTIM\_SimplePWMStop\_DMA(),
  - Simple input capture: HAL\_HRTIM\_SimpleCaptureChannelConfig(),  
HAL\_HRTIM\_SimpleCaptureStart(), HAL\_HRTIM\_SimpleCaptureStop(),  
HAL\_HRTIM\_SimpleCaptureStart\_IT(), HAL\_HRTIM\_SimpleCaptureStop\_IT(),  
HAL\_HRTIM\_SimpleCaptureStart\_DMA(), HAL\_HRTIM\_SimpleCaptureStop\_DM\_A().
  - Simple one pulse: HAL\_HRTIM\_SimpleOnePulseChannelConfig(),  
HAL\_HRTIM\_SimpleOnePulseStart(), HAL\_HRTIM\_SimpleOnePulseStop(),  
HAL\_HRTIM\_SimpleOnePulseStart\_IT(), HAL\_HRTIM\_SimpleOnePulseStop\_IT().

### If the HRTIM timer operates in waveform mode

1. Completes waveform timer configuration
  - HAL\_HRTIM\_WaveformTimerConfig(): configuration of a HRTIM timer operating in wave form mode mainly consists in:

- Enabling the HRTIM timer interrupts and DMA requests.
  - Enabling the half mode for the HRTIM timer.
  - Defining how the HRTIM timer reacts to external synchronization input.
  - Enabling the push-pull mode for the HRTIM timer.
  - Enabling the fault channels for the HRTIM timer.
  - Enabling the dead-time insertion for the HRTIM timer.
  - Setting the delayed protection mode for the HRTIM timer (source and outputs on which the delayed protection are applied).
  - Specifying the HRTIM timer update and reset triggers.
  - Specifying the HRTIM timer registers update policy (e.g. pre-load enabling).
  - HAL\_HRTIM\_TimerEventFilteringConfig(): configures external event blanking and windowing circuitry of a HRTIM timer:
    - Blanking: to mask external events during a defined time period a defined time period
    - Windowing, to enable external events only during a defined time period
  - HAL\_HRTIM\_DeadTimeConfig(): configures the dead-time insertion unit for a HRTIM timer. Allows to generate a couple of complementary signals from a single reference waveform, with programmable delays between active state.
  - HAL\_HRTIM\_ChopperModeConfig(): configures the parameters of the high-frequency carrier signal added on top of the timing unit output. Chopper mode can be enabled or disabled for each timer output separately (see HAL\_HRTIM\_WaveformOutputConfig()).
  - HAL\_HRTIM\_BurstDMAConfig(): configures the burst DMA burst controller. Allows having multiple HRTIM registers updated with a single DMA request. The burst DMA operation is started by calling HAL\_HRTIM\_BurstDMATransfer().
  - HAL\_HRTIM\_WaveformCompareConfig(): configures the compare unit of a HRTIM timer. This operation consists in setting the compare value and possibly specifying the auto delayed mode for compare units 2 and 4 (allows to have compare events generated relatively to capture events). Note that when auto delayed mode is needed, the capture unit associated to the compare unit must be configured separately.
  - HAL\_HRTIM\_WaveformCaptureConfig(): configures the capture unit of a HRTIM timer. This operation consists in specifying the source(s) triggering the capture (timer register update event, external event, timer output set/reset event, other HRTIM timer related events).
  - HAL\_HRTIM\_WaveformOutputConfig(): configuration of a HRTIM timer output mainly consists in:
    - Setting the output polarity (active high or active low),
    - Defining the set/reset crossbar for the output,
    - Specifying the fault level (active or inactive) in IDLE and FAULT states.,
2. Set waveform timer output(s) level
  - HAL\_HRTIM\_WaveformSetOutputLevel(): forces the output to its active or inactive level. For example, when deadtime insertion is enabled it is necessary to force the output level by software to have the outputs in a complementary state as soon as the RUN mode is entered.
3. Enable or Disable waveform timer output(s)
  - HAL\_HRTIM\_WaveformOutputStart(),HAL\_HRTIM\_WaveformOutputStop().
4. Start or Stop waveform HRTIM timer(s).
  - HAL\_HRTIM\_WaveformCounterStart(),HAL\_HRTIM\_WaveformCounterStop(),
  - HAL\_HRTIM\_WaveformCounterStart\_IT(),HAL\_HRTIM\_WaveformCounterStop\_IT(),
  - HAL\_HRTIM\_WaveformCounterStart()\_DMA,HAL\_HRTIM\_WaveformCounterStop\_DMA(),

5. Burst mode controller enabling:
  - HAL\_HRTIM\_BurstModeCtl(): activates or de-activates the burst mode controller.
6. Some HRTIM operations can be triggered by software:
  - HAL\_HRTIM\_BurstModeSoftwareTrigger(): calling this function trigs the burst operation.
  - HAL\_HRTIM\_SoftwareCapture(): calling this function trigs the capture of the HRTIM timer counter.
  - HAL\_HRTIM\_SoftwareUpdate(): calling this function trigs the update of the pre-loadable registers of the HRTIM timer
  - HAL\_HRTIM\_SoftwareReset(): calling this function resets the HRTIM timer counter.
7. Some functions can be used any time to retrieve HRTIM timer related information
  - HAL\_HRTIM\_GetCapturedValue(): returns actual value of the capture register of the designated capture unit.
  - HAL\_HRTIM\_WaveformGetOutputLevel(): returns actual level (ACTIVE/INACTIVE) of the designated timer output.
  - HAL\_HRTIM\_WaveformGetOutputState(): returns actual state (IDLE/RUN/FAULT) of the designated timer output.
  - HAL\_HRTIM\_GetDelayedProtectionStatus(): returns actual level (ACTIVE/INACTIVE) of the designated output when the delayed protection was triggered.
  - HAL\_HRTIM\_GetBurstStatus(): returns the actual status (ACTIVE/INACTIVE) of the burst mode controller.
  - HAL\_HRTIM\_GetCurrentPushPullStatus(): when the push-pull mode is enabled for the HRTIM timer (see HAL\_HRTIM\_WaveformTimerConfig()), the push-pull status indicates on which output the signal is currently active (e.g signal applied on output 1 and output 2 forced inactive or vice versa).
  - HAL\_HRTIM\_GetIdlePushPullStatus(): when the push-pull mode is enabled for the HRTIM timer (see HAL\_HRTIM\_WaveformTimerConfig()), the idle push-pull status indicates during which period the delayed protection request occurred (e.g. protection occurred when the output 1 was active and output 2 forced inactive or vice versa).
8. Some functions can be used any time to retrieve actual HRTIM status
  - HAL\_HRTIM\_GetState(): returns actual HRTIM instance HAL state.

### 23.2.3 Initialization and Time Base Configuration functions

This section provides functions allowing to:

- Initialize a HRTIM instance
- De-initialize a HRTIM instance
- Initialize the HRTIM MSP
- De-initialize the HRTIM MSP
- Start the high-resolution unit (start DLL calibration)
- Check that the high resolution unit is ready (DLL calibration done)
- Configure the time base unit of a HRTIM timer

This section contains the following APIs:

- [\*\*HAL\\_HRTIM\\_Init\(\)\*\*](#)
- [\*\*HAL\\_HRTIM\\_DelInit\(\)\*\*](#)
- [\*\*HAL\\_HRTIM\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_HRTIM\\_MspDelInit\(\)\*\*](#)
- [\*\*HAL\\_HRTIM\\_DLLCalibrationStart\(\)\*\*](#)

- [`HAL\_HRTIM\_DLLCalibrationStart\_IT\(\)`](#)
- [`HAL\_HRTIM\_PollForDLLCalibration\(\)`](#)
- [`HAL\_HRTIM\_TimeBaseConfig\(\)`](#)

### 23.2.4 Simple time base mode functions

This section provides functions allowing to:

- Start simple time base
- Stop simple time base
- Start simple time base and enable interrupt
- Stop simple time base and disable interrupt
- Start simple time base and enable DMA transfer
- Stop simple time base and disable DMA transfer When a HRTIM timer operates in simple time base mode, the timer counter counts from 0 to the period value.

This section contains the following APIs:

- [`HAL\_HRTIM\_SimpleBaseStart\(\)`](#)
- [`HAL\_HRTIM\_SimpleBaseStop\(\)`](#)
- [`HAL\_HRTIM\_SimpleBaseStart\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimpleBaseStop\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimpleBaseStart\_DMA\(\)`](#)
- [`HAL\_HRTIM\_SimpleBaseStop\_DMA\(\)`](#)

### 23.2.5 Simple output compare functions

This section provides functions allowing to:

- Configure simple output channel
- Start simple output compare
- Stop simple output compare
- Start simple output compare and enable interrupt
- Stop simple output compare and disable interrupt
- Start simple output compare and enable DMA transfer
- Stop simple output compare and disable DMA transfer When a HRTIM timer operates in simple output compare mode the output level is set to a programmable value when a match is found between the compare register and the counter. Compare unit 1 is automatically associated to output 1 Compare unit 2 is automatically associated to output 2

This section contains the following APIs:

- [`HAL\_HRTIM\_SimpleOCChannelConfig\(\)`](#)
- [`HAL\_HRTIM\_SimpleOCStart\(\)`](#)
- [`HAL\_HRTIM\_SimpleOCStop\(\)`](#)
- [`HAL\_HRTIM\_SimpleOCStart\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimpleOCStop\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimpleOCStart\_DMA\(\)`](#)
- [`HAL\_HRTIM\_SimpleOCStop\_DMA\(\)`](#)

### 23.2.6 Simple PWM output functions

This section provides functions allowing to:

- Configure simple PWM output channel
- Start simple PWM output
- Stop simple PWM output

- Start simple PWM output and enable interrupt
- Stop simple PWM output and disable interrupt
- Start simple PWM output and enable DMA transfer
- Stop simple PWM output and disable DMA transfer When a HRTIM timer operates in simple PWM output mode the output level is set to a programmable value when a match is found between the compare register and the counter and reset when the timer period is reached. Duty cycle is determined by the comparison value. Compare unit 1 is automatically associated to output 1 Compare unit 2 is automatically associated to output 2

This section contains the following APIs:

- [`HAL\_HRTIM\_SimplePWMChannelConfig\(\)`](#)
- [`HAL\_HRTIM\_SimplePWMStart\(\)`](#)
- [`HAL\_HRTIM\_SimplePWMStop\(\)`](#)
- [`HAL\_HRTIM\_SimplePWMStart\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimplePWMStop\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimplePWMStart\_DMA\(\)`](#)
- [`HAL\_HRTIM\_SimplePWMStop\_DMA\(\)`](#)

### 23.2.7 Simple input capture functions

This section provides functions allowing to:

- Configure simple input capture channel
- Start simple input capture
- Stop simple input capture
- Start simple input capture and enable interrupt
- Stop simple input capture and disable interrupt
- Start simple input capture and enable DMA transfer
- Stop simple input capture and disable DMA transfer When a HRTIM timer operates in simple input capture mode the Capture Register (HRTIM\_CPT1/2xR) is used to latch the value of the timer counter counter after a transition detected on a given external event input.

This section contains the following APIs:

- [`HAL\_HRTIM\_SimpleCaptureChannelConfig\(\)`](#)
- [`HAL\_HRTIM\_SimpleCaptureStart\(\)`](#)
- [`HAL\_HRTIM\_SimpleCaptureStop\(\)`](#)
- [`HAL\_HRTIM\_SimpleCaptureStart\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimpleCaptureStop\_IT\(\)`](#)
- [`HAL\_HRTIM\_SimpleCaptureStart\_DMA\(\)`](#)
- [`HAL\_HRTIM\_SimpleCaptureStop\_DMA\(\)`](#)

### 23.2.8 Simple one pulse functions

This section provides functions allowing to:

- Configure one pulse channel
- Start one pulse generation
- Stop one pulse generation
- Start one pulse generation and enable interrupt
- Stop one pulse generation and disable interrupt When a HRTIM timer operates in simple one pulse mode the timer counter is started in response to transition detected on a given external event input to generate a pulse with a programmable length after a programmable delay.

This section contains the following APIs:

- [\*HAL\\_HRTIM\\_SimpleOnePulseChannelConfig\(\)\*](#)
- [\*HAL\\_HRTIM\\_SimpleOnePulseStart\(\)\*](#)
- [\*HAL\\_HRTIM\\_SimpleOnePulseStop\(\)\*](#)
- [\*HAL\\_HRTIM\\_SimpleOnePulseStart\\_IT\(\)\*](#)
- [\*HAL\\_HRTIM\\_SimpleOnePulseStop\\_IT\(\)\*](#)

### 23.2.9 HRTIM configuration functions

This section provides functions allowing to configure the HRTIM resources shared by all the HRTIM timers operating in waveform mode:

- Configure the burst mode controller
- Configure an external event conditionning
- Configure the external events sampling clock
- Configure a fault conditionning
- Enable or disable fault inputs
- Configure the faults sampling clock
- Configure an ADC trigger

This section contains the following APIs:

- [\*HAL\\_HRTIM\\_BurstModeConfig\(\)\*](#)
- [\*HAL\\_HRTIM\\_EventConfig\(\)\*](#)
- [\*HAL\\_HRTIM\\_EventPrescalerConfig\(\)\*](#)
- [\*HAL\\_HRTIM\\_FaultConfig\(\)\*](#)

### 23.2.10 HRTIM timer configuration and control functions

This section provides functions used to configure and control a HRTIM timer operating in waveform mode:

- Configure HRTIM timer general behavior
- Configure HRTIM timer event filtering
- Configure HRTIM timer deadtime insertion
- Configure HRTIM timer chopper mode
- Configure HRTIM timer burst DMA
- Configure HRTIM timer compare unit
- Configure HRTIM timer capture unit
- Configure HRTIM timer output
- Set HRTIM timer output level
- Enable HRTIM timer output
- Disable HRTIM timer output
- Start HRTIM timer
- Stop HRTIM timer
- Start HRTIM timer and enable interrupt
- Stop HRTIM timer and disable interrupt
- Start HRTIM timer and enable DMA transfer
- Stop HRTIM timer and disable DMA transfer
- Enable or disable the burst mode controller
- Start the burst mode controller (by software)
- Trigger a Capture (by software)

- Update the HRTIM timer preloadable registers (by software)
- Reset the HRTIM timer counter (by software)
- Start a burst DMA transfer
- Enable timer register update
- Disable timer register update

This section contains the following APIs:

- `HAL_HRTIM_WaveformTimerConfig()`
- `HAL_HRTIM_TimerEventFilteringConfig()`
- `HAL_HRTIM_DeadTimeConfig()`
- `HAL_HRTIM_ChopperModeConfig()`
- `HAL_HRTIM_BurstDMAConfig()`
- `HAL_HRTIM_WaveformCompareConfig()`
- `HAL_HRTIM_WaveformCaptureConfig()`
- `HAL_HRTIM_WaveformOutputConfig()`
- `HAL_HRTIM_WaveformSetOutputLevel()`
- `HAL_HRTIM_WaveformOutputStart()`
- `HAL_HRTIM_WaveformOutputStop()`
- `HAL_HRTIM_WaveformCounterStart()`
- `HAL_HRTIM_WaveformCounterStop()`
- `HAL_HRTIM_WaveformCounterStart_IT()`
- `HAL_HRTIM_WaveformCounterStop_IT()`
- `HAL_HRTIM_WaveformCounterStart_DMA()`
- `HAL_HRTIM_WaveformCounterStop_DMA()`
- `HAL_HRTIM_BurstModeCtl()`
- `HAL_HRTIM_BurstModeSoftwareTrigger()`
- `HAL_HRTIM_SoftwareCapture()`
- `HAL_HRTIM_SoftwareUpdate()`
- `HAL_HRTIM_SoftwareReset()`
- `HAL_HRTIM_BurstDMATransfer()`
- `HAL_HRTIM_UpdateEnable()`
- `HAL_HRTIM_UpdateDisable()`

### 23.2.11 Peripheral State functions

This section provides functions used to get HRTIM or HRTIM timer specific information:

- Get HRTIM HAL state
- Get captured value
- Get HRTIM timer output level
- Get HRTIM timer output state
- Get delayed protection status
- Get burst status
- Get current push-pull status
- Get idle push-pull status

This section contains the following APIs:

- `HAL_HRTIM_GetState()`
- `HAL_HRTIM_GetCapturedValue()`
- `HAL_HRTIM_WaveformGetOutputLevel()`
- `HAL_HRTIM_WaveformGetOutputState()`
- `HAL_HRTIM_GetDelayedProtectionStatus()`
- `HAL_HRTIM_GetBurstStatus()`
- `HAL_HRTIM_GetCurrentPushPullStatus()`

- [\*\*\*HAL\\_HRTIM\\_GetIdlePushPullStatus\(\)\*\*\*](#)

### 23.2.12 Detailed description of functions

#### **HAL\_HRTIM\_Init**

|                      |                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HRTIM_Init (HRTIM_HandleTypeDefDef * hhrtim)</b>                      |
| Function description | Initializes a HRTIM instance.                                                                  |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                         |

#### **HAL\_HRTIM\_DelInit**

|                      |                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HRTIM_DelInit (HRTIM_HandleTypeDefDef * hhrtim)</b>                   |
| Function description | De-initializes a HRTIM instance.                                                               |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                         |

#### **HAL\_HRTIM\_MspInit**

|                      |                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_MspInit (HRTIM_HandleTypeDefDef * hhrtim)</b>                                |
| Function description | MSP initialization for a HRTIM instance.                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                |

#### **HAL\_HRTIM\_MspDelInit**

|                      |                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_MspDelInit (HRTIM_HandleTypeDefDef * hhrtim)</b>                             |
| Function description | MSP de-initialization for a HRTIM instance.                                                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                |

#### **HAL\_HRTIM\_TimeBaseConfig**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HRTIM_TimeBaseConfig (HRTIM_HandleTypeDefDef * hhrtim, uint32_t TimerIdx, HRTIM_TimeBaseCfgTypeDef * pTimeBaseCfg)</b>                                                                                                                                                                                                                                                                                         |
| Function description | Configures the time base unit of a timer.                                                                                                                                                                                                                                                                                                                                                                                               |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> <li>• <b>TimerIdx:</b> Timer index This parameter can be one of the following values: <ul style="list-style-type: none"> <li>– HRTIM_TIMERINDEX_MASTER for master timer</li> <li>– HRTIM_TIMERINDEX_TIMER_A for timer A</li> <li>– HRTIM_TIMERINDEX_TIMER_B for timer B</li> <li>– HRTIM_TIMERINDEX_TIMER_C for timer C</li> </ul> </li> </ul> |

|               |                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <ul style="list-style-type: none"> <li>- HRTIM_TIMERINDEX_TIMER_D for timer D</li> <li>- HRTIM_TIMERINDEX_TIMER_E for timer E</li> </ul>                                                                                                                                                                        |
| Return values | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                          |
| Notes         | <ul style="list-style-type: none"> <li>• This function must be called prior starting the timer</li> <li>• The time-base unit initialization parameters specify: The timer counter operating mode (continuous, one shot), The timer clock prescaler, The timer period , The timer repetition counter.</li> </ul> |

### HAL\_HRTIM\_DLLCalibrationStart

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HRTIM_DLLCalibrationStart (HRTIM_HandleTypeDef * hhrtim, uint32_t CalibrationRate)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Function description | Starts the DLL calibration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> <li>• <b>CalibrationRate:</b> DLL calibration period This parameter can be one of the following values: <ul style="list-style-type: none"> <li>- HRTIM_SINGLE_CALIBRATION: One shot DLL calibration</li> <li>- HRTIM_CALIBRATIONRATE_7300: Periodic DLL calibration. T=7.3 ms</li> <li>- HRTIM_CALIBRATIONRATE_910: Periodic DLL calibration. T=910 us</li> <li>- HRTIM_CALIBRATIONRATE_114: Periodic DLL calibration. T=114 us</li> <li>- HRTIM_CALIBRATIONRATE_14: Periodic DLL calibration. T=14 us</li> </ul> </li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Notes                | <ul style="list-style-type: none"> <li>• This function locks the HRTIM instance. HRTIM instance is unlocked within the HAL_HRTIM_PollForDLLCalibration function, just before exiting the function.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> <li>• <b>CalibrationRate:</b> DLL calibration period This parameter can be one of the following values: <ul style="list-style-type: none"> <li>- HRTIM_SINGLE_CALIBRATION: One shot DLL calibration</li> <li>- HRTIM_CALIBRATIONRATE_7300: Periodic DLL calibration. T=7.3 ms</li> <li>- HRTIM_CALIBRATIONRATE_910: Periodic DLL calibration. T=910 us</li> <li>- HRTIM_CALIBRATIONRATE_114: Periodic DLL calibration. T=114 us</li> </ul> </li> </ul> |

- HRTIM\_CALIBRATIONRATE\_14: Periodic DLL calibration. T=14 us

Return values

- **HAL:** status

Notes

- This function locks the HRTIM instance. HRTIM instance is unlocked within the IRQ processing function when processing the DLL ready interrupt.
- If this function is called for periodic calibration, the DLLRDY interrupt is generated every time the calibration completes which will significantly increases the overall interrupt rate.

### **HAL\_HRTIM\_PollForDLLCalibration**

Function name      **HAL\_StatusTypeDef HAL\_HRTIM\_PollForDLLCalibration(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t Timeout)**

Function description      Polls the DLL calibration ready flag and returns when the flag is set (DLL calibration completed) or upon timeout expiration.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timeout:** Timeout duration in millisecond

Return values

- **HAL:** status

### **HAL\_HRTIM\_SimpleBaseStart**

Function name      **HAL\_StatusTypeDef HAL\_HRTIM\_SimpleBaseStart(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description      Starts the counter of a timer operating in simple time base mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_MASTER for master timer
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **HAL:** status

### **HAL\_HRTIM\_SimpleBaseStop**

Function name      **HAL\_StatusTypeDef HAL\_HRTIM\_SimpleBaseStop(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description      Stops the counter of a timer operating in simple time base mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_MASTER for master timer
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C

- HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- Return values
- **HAL:** status

### **HAL\_HRTIM\_SimpleBaseStart\_IT**

- HRTIM\_TIMERINDEX\_TIMER\_D for timer D
- HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- **SrcAddr:** DMA transfer source address
- **DestAddr:** DMA transfer destination address
- **Length:** The length of data items (data size) to be transferred from source to destination

following values:

- HRTIM\_OUTPUT\_TA1: Timer A - Output 1
- HRTIM\_OUTPUT\_TA2: Timer A - Output 2
- HRTIM\_OUTPUT\_TB1: Timer B - Output 1
- HRTIM\_OUTPUT\_TB2: Timer B - Output 2
- HRTIM\_OUTPUT\_TC1: Timer C - Output 1
- HRTIM\_OUTPUT\_TC2: Timer C - Output 2
- HRTIM\_OUTPUT\_TD1: Timer D - Output 1
- HRTIM\_OUTPUT\_TD2: Timer D - Output 2
- HRTIM\_OUTPUT\_TE1: Timer E - Output 1
- HRTIM\_OUTPUT\_TE2: Timer E - Output 2
- **SrcAddr:** DMA transfer source address
- **DestAddr:** DMA transfer destination address
- **Length:** The length of data items (data size) to be transferred from source to destination

#### Return values

- **HAL:** status

#### Notes

- DMA request enabling depends on the chosen output compare mode Output toggle: compare match DMA request is enabled Output set active: output set DMA request is enabled Output set inactive: output reset DMA request is enabled

## HAL\_HRTIM\_SimpleOCStop\_DMA

#### Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_SimpleOCStop\_DMA(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t OCChannel)**

#### Function description

Stops the output compare signal generation on the designed timer output (DMA request is disabled).

#### Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM\_OUTPUT\_TA1: Timer A - Output 1
  - HRTIM\_OUTPUT\_TA2: Timer A - Output 2
  - HRTIM\_OUTPUT\_TB1: Timer B - Output 1
  - HRTIM\_OUTPUT\_TB2: Timer B - Output 2
  - HRTIM\_OUTPUT\_TC1: Timer C - Output 1
  - HRTIM\_OUTPUT\_TC2: Timer C - Output 2
  - HRTIM\_OUTPUT\_TD1: Timer D - Output 1
  - HRTIM\_OUTPUT\_TD2: Timer D - Output 2
  - HRTIM\_OUTPUT\_TE1: Timer E - Output 1
  - HRTIM\_OUTPUT\_TE2: Timer E - Output 2

#### Return values

- **HAL:** status

**HAL\_HRTIM\_SimplePWMChannelConfig**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### **HAL\_HRTIM\_SimplePWMStart\_DMA**

Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_SimplePWMStart\_DMA**  
**(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t**  
**PWMChannel, uint32\_t SrcAddr, uint32\_t DestAddr, uint32\_t**  
**Length)**

Function description

Starts the PWM output signal generation on the designed timer output (The compare DMA request is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM\_OUTPUT\_TA1: Timer A - Output 1
  - HRTIM\_OUTPUT\_TA2: Timer A - Output 2
  - HRTIM\_OUTPUT\_TB1: Timer B - Output 1
  - HRTIM\_OUTPUT\_TB2: Timer B - Output 2
  - HRTIM\_OUTPUT\_TC1: Timer C - Output 1
  - HRTIM\_OUTPUT\_TC2: Timer C - Output 2
  - HRTIM\_OUTPUT\_TD1: Timer D - Output 1
  - HRTIM\_OUTPUT\_TD2: Timer D - Output 2
  - HRTIM\_OUTPUT\_TE1: Timer E - Output 1
  - HRTIM\_OUTPUT\_TE2: Timer E - Output 2
- **SrcAddr:** DMA transfer source address
- **DestAddr:** DMA transfer destination address
- **Length:** The length of data items (data size) to be transferred from source to destination

Return values

- **HAL:** status

### **HAL\_HRTIM\_SimplePWMStop\_DMA**

Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_SimplePWMStop\_DMA**  
**(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t**  
**PWMChannel)**

Function description

Stops the PWM output signal generation on the designed timer output (The compare DMA request is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the

following values:

- HRTIM\_TIMERINDEX\_TIMER\_A for timer A
- HRTIM\_TIMERINDEX\_TIMER\_B for timer B

**HAL\_HRTIM\_SimpleOnePulseStart\_IT**

Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_SimpleOnePulseStart\_IT  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t OnePulseChannel)**

Function description

Enables the simple one pulse signal generation on the designed output (The compare interrupt is enabled (pulse start)).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- **OnePulseChannel:** Timer output This parameter can be one of the following values:
  - HRTIM\_OUTPUT\_TA1: Timer A - Output 1
  - HRTIM\_OUTPUT\_TA2: Timer A - Output 2
  - HRTIM\_OUTPUT\_TB1: Timer B - Output 1
  - HRTIM\_OUTPUT\_TB2: Timer B - Output 2
  - HRTIM\_OUTPUT\_TC1: Timer C - Output 1
  - HRTIM\_OUTPUT\_TC2: Timer C - Output 2
  - HRTIM\_OUTPUT\_TD1: Timer D - Output 1
  - HRTIM\_OUTPUT\_TD2: Timer D - Output 2
  - HRTIM\_OUTPUT\_TE1: Timer E - Output 1
  - HRTIM\_OUTPUT\_TE2: Timer E - Output 2

Return values

- **HAL:** status

**HAL\_HRTIM\_SimpleOnePulseStop\_IT**

Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_SimpleOnePulseStop\_IT  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t OnePulseChannel)**

Function description

Disables the simple one pulse signal generation on the designed output (The compare interrupt is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D

- HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- **OnePulseChannel:** Timer output This parameter can be one of the following values:
  - HRTIM\_OUTPUT\_TA1: Timer A - Output 1
  - HRTIM\_OUTPUT\_TA2: Timer A - Output 2
  - HRTIM\_OUTPUT\_TB1: Timer B - Output 1
  - HRTIM\_OUTPUT\_TB2: Timer B - Output 2
  - HRTIM\_OUTPUT\_TC1: Timer C - Output 1
  - HRTIM\_OUTPUT\_TC2: Timer C - Output 2
  - HRTIM\_OUTPUT\_TD1: Timer D - Output 1
  - HRTIM\_OUTPUT\_TD2: Timer D - Output 2
  - HRTIM\_OUTPUT\_TE1: Timer E - Output 1
  - HRTIM\_OUTPUT\_TE2: Timer E - Output 2

**Return values**

- **HAL:** status

| Function description | Configures the compare unit of a timer operating in waveform mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> <li>• <b>TimerIdx:</b> Timer index This parameter can be one of the following values: <ul style="list-style-type: none"> <li>– HRTIM_TIMERINDEX_MASTER for master timer</li> <li>– HRTIM_TIMERINDEX_TIMER_A for timer A</li> <li>– HRTIM_TIMERINDEX_TIMER_B for timer B</li> <li>– HRTIM_TIMERINDEX_TIMER_C for timer C</li> <li>– HRTIM_TIMERINDEX_TIMER_D for timer D</li> <li>– HRTIM_TIMERINDEX_TIMER_E for timer E</li> </ul> </li> <li>• <b>CompareUnit:</b> Compare unit to configure This parameter can be one of the following values: <ul style="list-style-type: none"> <li>– HRTIM_COMPAREUNIT_1: Compare unit 1</li> <li>– HRTIM_COMPAREUNIT_2: Compare unit 2</li> <li>– HRTIM_COMPAREUNIT_3: Compare unit 3</li> <li>– HRTIM_COMPAREUNIT_4: Compare unit 4</li> </ul> </li> <li>• <b>pCompareCfg:</b> pointer to the compare unit configuration structure</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Notes                | <ul style="list-style-type: none"> <li>• When auto delayed mode is required for compare unit 2 or compare unit 4, application has to configure separately the capture unit. Capture unit to configure in that case depends</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

on the compare unit auto delayed mode is applied to (see below): Auto delayed on output compare 2: capture unit 1 must be configured Auto delayed on output compare 4: capture unit 2 must be configured

- This function must be called before starting the timer

**Return values**

- **HAL:** status

**Notes**

- This function must be called before starting the timer

### HAL\_HRTIM\_WaveformCounterStart

**Function name** **HAL\_StatusTypeDef HAL\_HRTIM\_WaveformCounterStart (HRTIM\_HandleTypeDef \* hhrtim, uint32\_t Timers)**

**Function description** Starts the counter of the designated timer(s) operating in waveform mode. Timers can be combined (ORed) to allow for simultaneous counter start.

**Parameters**

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer counter(s) to start. This parameter can be any combination of the following values:
  - HRTIM\_TIMERID\_MASTER
  - HRTIM\_TIMERID\_TIMER\_A
  - HRTIM\_TIMERID\_TIMER\_B
  - HRTIM\_TIMERID\_TIMER\_C
  - HRTIM\_TIMERID\_TIMER\_D
  - HRTIM\_TIMERID\_TIMER\_E

**Return values**

- **HAL:** status

**HAL\_HRTIM\_WaveformCounterStop**

| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> <li>• <b>OutputsToStop:</b> Timer output(s) to disable This parameter can be any combination of the following values: <ul style="list-style-type: none"> <li>- HRTIM_OUTPUT_TA1: Timer A - Output 1</li> <li>- HRTIM_OUTPUT_TA2: Timer A - Output 2</li> <li>- HRTIM_OUTPUT_TB1: Timer B - Output 1</li> <li>- HRTIM_OUTPUT_TB2: Timer B - Output 2</li> <li>- HRTIM_OUTPUT_TC1: Timer C - Output 1</li> <li>- HRTIM_OUTPUT_TC2: Timer C - Output 2</li> <li>- HRTIM_OUTPUT_TD1: Timer D - Output 1</li> </ul> </li> </ul> |

- HRTIM\_OUTPUT\_TD2: Timer D - Output 2
- HRTIM\_OUTPUT\_TE1: Timer E - Output 1
- HRTIM\_OUTPUT\_TE2: Timer E - Output 2

Return values

- **HAL:** status

### **HAL\_HRTIM\_BurstModeCtl**

Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_BurstModeCtl  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t Enable)**

Function description

Enables or disables the HRTIM burst mode controller.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Enable:** Burst mode controller enabling This parameter can be one of the following values:
  - HRTIM\_BURSTMODECTL\_ENABLED: Burst mode enabled
  - HRTIM\_BURSTMODECTL\_DISABLED: Burst mode disabled

Return values

- **HAL:** status

Notes

- This function must be called after starting the timer(s)

### **HAL\_HRTIM\_BurstModeSoftwareTrigger**

Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_BurstModeSoftwareTrigger  
(HRTIM\_HandleTypeDef \* hhrtim)**

Function description

Triggers the burst mode operation.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **HAL:** status

### **HAL\_HRTIM\_SoftwareCapture**

Function name

**HAL\_StatusTypeDef HAL\_HRTIM\_SoftwareCapture  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t CaptureUnit)**

Function description

Triggers a software capture on the designed capture unit.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- **CaptureUnit:** Capture unit to trig This parameter can be one of the following values:
  - HRTIM\_CAPTUREUNIT\_1: Capture unit 1
  - HRTIM\_CAPTUREUNIT\_2: Capture unit 2

Return values

- **HAL:** status

- Notes**
- The software capture' bit in the capure configuration register is automatically reset by hardware

### HAL\_HRTIM\_UpdateDisable

|                      |                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_HRTIM_UpdateDisable<br/>(HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)</b>             |
| Function description | Disables the transfer from preload to active registers for one or several timing units (including master timer). |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul>                   |

- **Timers:** Timer(s) concerned by the register preload disabling command This parameter can be any combination of the following values:
    - HRTIM\_TIMERUPDATE\_MASTER
    - HRTIM\_TIMERUPDATE\_A
    - HRTIM\_TIMERUPDATE\_B
    - HRTIM\_TIMERUPDATE\_C
    - HRTIM\_TIMERUPDATE\_D
    - HRTIM\_TIMERUPDATE\_E
- Return values
- **HAL:** status

### **HAL\_HRTIM\_GetState**

Function name      **HAL\_HRTIM\_StateTypeDef HAL\_HRTIM\_GetState  
(HRTIM\_HandleTypeDef \* hhrtim)**

Function description      return the HRTIM HAL state

Parameters      • **hhrtim:** pointer to HAL HRTIM handle

Return values      • **HAL:** state

### **HAL\_HRTIM\_GetCapturedValue**

Function name      **uint32\_t HAL\_HRTIM\_GetCapturedValue  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t  
CaptureUnit)**

Function description      Returns actual value of the capture register of the designated capture unit.

Parameters      • **hhrtim:** pointer to HAL HRTIM handle  
                   • **TimerIdx:** Timer index This parameter can be one of the following values:  
                       – HRTIM\_TIMERINDEX\_TIMER\_A for timer A  
                       – HRTIM\_TIMERINDEX\_TIMER\_B for timer B  
                       – HRTIM\_TIMERINDEX\_TIMER\_C for timer C  
                       – HRTIM\_TIMERINDEX\_TIMER\_D for timer D  
                       – HRTIM\_TIMERINDEX\_TIMER\_E for timer E  
                   • **CaptureUnit:** Capture unit to trig This parameter can be one of the following values:  
                       – HRTIM\_CAPTUREUNIT\_1: Capture unit 1  
                       – HRTIM\_CAPTUREUNIT\_2: Capture unit 2

Return values      • **Captured:** value

### **HAL\_HRTIM\_WaveformGetOutputLevel**

Function name      **uint32\_t HAL\_HRTIM\_WaveformGetOutputLevel  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx, uint32\_t  
Output)**

Function description      Returns actual level (active or inactive) of the designated output.

Parameters      • **hhrtim:** pointer to HAL HRTIM handle  
                   • **TimerIdx:** Timer index This parameter can be one of the following values:

- HRTIM\_TIMERINDEX\_TIMER\_A for timer A
- HRTIM\_TIMERINDEX\_TIMER\_B for timer B
- HRTIM\_TIMERINDEX\_TIMER\_C for timer C
- HRTIM\_TIMERINDEX\_TIMER\_D for timer D
- HRTIM\_TIMERINDEX\_TIMER\_E for timer E
- **Output:** Timer output This parameter can be one of the following values:
  - HRTIM\_OUTPUT\_TA1: Timer A - Output 1
  - HRTIM\_OUTPUT\_TA2: Timer A - Output 2
  - HRTIM\_OUTPUT\_TB1: Timer B - Output 1
  - HRTIM\_OUTPUT\_TB2: Timer B - Output 2
  - HRTIM\_OUTPUT\_TC1: Timer C - Output 1
  - HRTIM\_OUTPUT\_TC2: Timer C - Output 2
  - HRTIM\_OUTPUT\_TD1: Timer D - Output 1
  - HRTIM\_OUTPUT\_TD2: Timer D - Output 2
  - HRTIM\_OUTPUT\_TE1: Timer E - Output 1
  - HRTIM\_OUTPUT\_TE2: Timer E - Output 2

Return values

- **Output:** level

Notes

- Returned output level is taken before the output stage (chopper, polarity).

### **HAL\_HRTIM\_WaveformGetOutputState**

| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                             |

### HAL\_HRTIM\_Fault1Callback

|                      |                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------|
| Function name        | <code>void HAL_HRTIM_Fault1Callback (HRTIM_HandleTypeDef * hhrtim)</code>                        |
| Function description | Callback function invoked when a fault 1 interrupt occurred.                                     |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle *</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> <li>• <b>None</b></li> </ul>           |

### HAL\_HRTIM\_Fault2Callback

|                      |                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------|
| Function name        | <code>void HAL_HRTIM_Fault2Callback (HRTIM_HandleTypeDef * hhrtim)</code>                      |
| Function description | Callback function invoked when a fault 2 interrupt occurred.                                   |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |

|               |                                                        |
|---------------|--------------------------------------------------------|
| Return values | <ul style="list-style-type: none"> <li>None</li> </ul> |
|---------------|--------------------------------------------------------|

### **HAL\_HRTIM\_Fault3Callback**

|                      |                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_Fault3Callback (HRTIM_HandleTypeDef * hhrtim)</b>                          |
| Function description | Callback function invoked when a fault 3 interrupt occurred.                                 |
| Parameters           | <ul style="list-style-type: none"> <li><b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>None</li> </ul>                                       |

### **HAL\_HRTIM\_Fault4Callback**

|                      |                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_Fault4Callback (HRTIM_HandleTypeDef * hhrtim)</b>                          |
| Function description | Callback function invoked when a fault 4 interrupt occurred.                                 |
| Parameters           | <ul style="list-style-type: none"> <li><b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>None</li> </ul>                                       |

### **HAL\_HRTIM\_Fault5Callback**

|                      |                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_Fault5Callback (HRTIM_HandleTypeDef * hhrtim)</b>                          |
| Function description | Callback function invoked when a fault 5 interrupt occurred.                                 |
| Parameters           | <ul style="list-style-type: none"> <li><b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>None</li> </ul>                                       |

### **HAL\_HRTIM\_SystemFaultCallback**

|                      |                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_SystemFaultCallback (HRTIM_HandleTypeDef * hhrtim)</b>                     |
| Function description | Callback function invoked when a system fault interrupt occurred.                            |
| Parameters           | <ul style="list-style-type: none"> <li><b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>None</li> </ul>                                       |

### **HAL\_HRTIM\_DLLCalibrationReadyCallback**

|                      |                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_DLLCalibrationReadyCallback (HRTIM_HandleTypeDef * hhrtim)</b>             |
| Function description | Callback function invoked when the DLL calibration is completed.                             |
| Parameters           | <ul style="list-style-type: none"> <li><b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>None</li> </ul>                                       |

**HAL\_HRTIM\_BurstModePeriodCallback**

|                      |                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_BurstModePeriodCallback<br/>(HRTIM_HandleTypeDef * hhrtim)</b>               |
| Function description | Callback function invoked when the end of the burst mode period is reached.                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                |

**HAL\_HRTIM\_SynchronizationEventCallback**

|                      |                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_SynchronizationEventCallback<br/>(HRTIM_HandleTypeDef * hhrtim)</b>          |
| Function description | Callback function invoked when a synchronization input event is received.                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                |

**HAL\_HRTIM\_RegistersUpdateCallback**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_RegistersUpdateCallback<br/>(HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Function description | Callback function invoked when timer registers are updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> <li>• <b>TimerIdx:</b> Timer index This parameter can be one of the following values: <ul style="list-style-type: none"> <li>- HRTIM_TIMERINDEX_MASTER for master timer</li> <li>- HRTIM_TIMERINDEX_TIMER_A for timer A</li> <li>- HRTIM_TIMERINDEX_TIMER_B for timer B</li> <li>- HRTIM_TIMERINDEX_TIMER_C for timer C</li> <li>- HRTIM_TIMERINDEX_TIMER_D for timer D</li> <li>- HRTIM_TIMERINDEX_TIMER_E for timer E</li> </ul> </li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**HAL\_HRTIM\_RepetitionEventCallback**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Function description | Callback function invoked when timer repetition period has elapsed.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hhrtim:</b> pointer to HAL HRTIM handle</li> <li>• <b>TimerIdx:</b> Timer index This parameter can be one of the following values: <ul style="list-style-type: none"> <li>- HRTIM_TIMERINDEX_MASTER for master timer</li> <li>- HRTIM_TIMERINDEX_TIMER_A for timer A</li> <li>- HRTIM_TIMERINDEX_TIMER_B for timer B</li> <li>- HRTIM_TIMERINDEX_TIMER_C for timer C</li> <li>- HRTIM_TIMERINDEX_TIMER_D for timer D</li> </ul> </li> </ul> |

- HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values • **None**

### **HAL\_HRTIM\_Compare1EventCallback**

Function name **void HAL\_HRTIM\_Compare1EventCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description Callback function invoked when the timer counter matches the value programmed in the compare 1 register.

- Parameters
- **hhrtim:** pointer to HAL HRTIM handle
  - **TimerIdx:** Timer index This parameter can be one of the following values:
    - HRTIM\_TIMERINDEX\_MASTER for master timer
    - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
    - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
    - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
    - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
    - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values • **None**

### **HAL\_HRTIM\_Compare2EventCallback**

Function name **void HAL\_HRTIM\_Compare2EventCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description Callback function invoked when the timer counter matches the value programmed in the compare 2 register.

- Parameters
- **hhrtim:** pointer to HAL HRTIM handle
  - **TimerIdx:** Timer index This parameter can be one of the following values:
    - HRTIM\_TIMERINDEX\_MASTER for master timer
    - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
    - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
    - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
    - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
    - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values • **None**

### **HAL\_HRTIM\_Compare3EventCallback**

Function name **void HAL\_HRTIM\_Compare3EventCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description Callback function invoked when the timer counter matches the value programmed in the compare 3 register.

- Parameters
- **hhrtim:** pointer to HAL HRTIM handle
  - **TimerIdx:** Timer index This parameter can be one of the following values:
    - HRTIM\_TIMERINDEX\_MASTER for master timer
    - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
    - HRTIM\_TIMERINDEX\_TIMER\_B for timer B

- HRTIM\_TIMERINDEX\_TIMER\_C for timer C
- HRTIM\_TIMERINDEX\_TIMER\_D for timer D
- HRTIM\_TIMERINDEX\_TIMER\_E for timer E

**Return values**

- **None**

**HAL\_HRTIM\_Compare4EventCallback****Function name**

**void HAL\_HRTIM\_Compare4EventCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

**Function description**

Callback function invoked when the timer counter matches the value programmed in the compare 4 register.

**Parameters**

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_MASTER for master timer
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

**Return values**

- **None**

**HAL\_HRTIM\_Capture1EventCallback****Function name**

**void HAL\_HRTIM\_Capture1EventCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

**Function description**

Callback function invoked when the timer x capture 1 event occurs.

**Parameters**

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

**Return values**

- **None**

**HAL\_HRTIM\_Capture2EventCallback****Function name**

**void HAL\_HRTIM\_Capture2EventCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

**Function description**

Callback function invoked when the timer x capture 2 event occurs.

**Parameters**

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B

- HRTIM\_TIMERINDEX\_TIMER\_C for timer C
- HRTIM\_TIMERINDEX\_TIMER\_D for timer D
- HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **None**

**HAL\_HRTIM\_DelayedProtectionCallback**

Function name

**void HAL\_HRTIM\_DelayedProtectionCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description

Callback function invoked when the delayed idle or balanced idle mode is entered.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **None**

**HAL\_HRTIM\_CounterResetCallback**

Function name

**void HAL\_HRTIM\_CounterResetCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description

Callback function invoked when the timer x counter reset/roll-over event occurs.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **None**

**HAL\_HRTIM\_Output1SetCallback**

Function name

**void HAL\_HRTIM\_Output1SetCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description

Callback function invoked when the timer x output 1 is set.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D

- HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **None**

### **HAL\_HRTIM\_Output1ResetCallback**

Function name

**void HAL\_HRTIM\_Output1ResetCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description

Callback function invoked when the timer x output 1 is reset.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **None**

### **HAL\_HRTIM\_Output2SetCallback**

Function name

**void HAL\_HRTIM\_Output2SetCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description

Callback function invoked when the timer x output 2 is set.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **None**

### **HAL\_HRTIM\_Output2ResetCallback**

Function name

**void HAL\_HRTIM\_Output2ResetCallback  
(HRTIM\_HandleTypeDef \* hhrtim, uint32\_t TimerIdx)**

Function description

Callback function invoked when the timer x output 2 is reset.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM\_TIMERINDEX\_TIMER\_A for timer A
  - HRTIM\_TIMERINDEX\_TIMER\_B for timer B
  - HRTIM\_TIMERINDEX\_TIMER\_C for timer C
  - HRTIM\_TIMERINDEX\_TIMER\_D for timer D
  - HRTIM\_TIMERINDEX\_TIMER\_E for timer E

Return values

- **None**

**HAL\_HRTIM\_BurstDMATransferCallback**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_HRTIM_BurstDMATransferCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Function description | Callback function invoked when a DMA burst transfer is completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 23.3 HRTIM Firmware driver defines

### 23.3.1 HRTIM

***HRTIM ADC Trigger***

|                            |                          |
|----------------------------|--------------------------|
| HRTIM_ADCTRIGGER_1         | ADC trigger 1 identifier |
| HRTIM_ADCTRIGGER_2         | ADC trigger 2 identifier |
| HRTIM_ADCTRIGGER_3         | ADC trigger 3 identifier |
| HRTIM_ADCTRIGGER_4         | ADC trigger 4 identifier |
| <b>IS_HRTIM_ADCTRIGGER</b> |                          |

***HRTIM ADC Trigger Event***

|                                     |                                  |
|-------------------------------------|----------------------------------|
| HRTIM_ADCTRIGGEREVENT13_NONE        | No ADC trigger event             |
| HRTIM_ADCTRIGGEREVENT13_MASTER_CMP1 | ADC Trigger on master compare 1U |
| HRTIM_ADCTRIGGEREVENT13_MASTER_CMP2 | ADC Trigger on master compare 2U |
| HRTIM_ADCTRIGGEREVENT13_MASTER_CMP3 | ADC Trigger on master compare 3U |
| HRTIM_ADCTRIGGEREVENT13_MASTER_CMP4 | ADC Trigger on master compare 4U |

|                                       |                                   |
|---------------------------------------|-----------------------------------|
| HRTIM_ADCTRIGGEREVENT13_MASTER_PERIOD | ADC Trigger on master period      |
| HRTIM_ADCTRIGGEREVENT13_EVENT_1       | ADC Trigger on external event 1U  |
| HRTIM_ADCTRIGGEREVENT13_EVENT_2       | ADC Trigger on external event 2U  |
| HRTIM_ADCTRIGGEREVENT13_EVENT_3       | ADC Trigger on external event 3U  |
| HRTIM_ADCTRIGGEREVENT13_EVENT_4       | ADC Trigger on external event 4U  |
| HRTIM_ADCTRIGGEREVENT13_EVENT_5       | ADC Trigger on external event 5U  |
| HRTIM_ADCTRIGGEREVENT13_TIMERA_CMP2   | ADC Trigger on Timer A compare 2U |
| HRTIM_ADCTRIGGEREVENT13_TIMERA_CMP3   | ADC Trigger on Timer A compare 3U |
| HRTIM_ADCTRIGGEREVENT13_TIMERA_CMP4   | ADC Trigger on Timer A compare 4U |
| HRTIM_ADCTRIGGEREVENT13_TIMERA_PERIOD | ADC Trigger on Timer A period     |
| HRTIM_ADCTRIGGEREVENT13_TIMERA_RESET  | ADC Trigger on Timer A reset      |
| HRTIM_ADCTRIGGEREVENT13_TIMERB_CMP2   | ADC Trigger on Timer B compare 2U |
| HRTIM_ADCTRIGGEREVENT13_TIMERB_CMP3   | ADC Trigger on Timer B compare 3U |
| HRTIM_ADCTRIGGEREVENT13_TIMERB_CMP4   | ADC Trigger on Timer B compare 4U |
| HRTIM_ADCTRIGGEREVENT13_TIMERB_PERIOD | ADC Trigger on Timer B period     |
| HRTIM_ADCTRIGGEREVENT13_TIMERB_RESET  | ADC Trigger on Timer B reset      |
| HRTIM_ADCTRIGGEREVENT13_TIMERC_CMP2   | ADC Trigger on Timer C compare 2U |
| HRTIM_ADCTRIGGEREVENT13_TIMERC_CMP3   | ADC Trigger on Timer C compare 3U |
| HRTIM_ADCTRIGGEREVENT13_TIMERC_CMP4   | ADC Trigger on Timer C compare 4U |
| HRTIM_ADCTRIGGEREVENT13_TIMERC_PERIOD | ADC Trigger on Timer C period     |
| HRTIM_ADCTRIGGEREVENT13_TIMERD_CMP2   | ADC Trigger on Timer D compare 2U |
| HRTIM_ADCTRIGGEREVENT13_TIMERD_CMP3   | ADC Trigger on Timer D compare 3U |
| HRTIM_ADCTRIGGEREVENT13_TIMERD_CMP4   | ADC Trigger on Timer D compare 4U |
| HRTIM_ADCTRIGGEREVENT13_TIMERD_PERIOD | ADC Trigger on Timer D period     |
| HRTIM_ADCTRIGGEREVENT13_TIMERE_CMP2   | ADC Trigger on Timer E compare 2U |
| HRTIM_ADCTRIGGEREVENT13_TIMERE_CMP3   | ADC Trigger on Timer E compare 3U |
| HRTIM_ADCTRIGGEREVENT13_TIMERE_CMP4   | ADC Trigger on Timer E compare    |

|                                       |                                   |
|---------------------------------------|-----------------------------------|
|                                       | 4U                                |
| HRTIM_ADCTRIGGEREVENT13_TIMERE_PERIOD | ADC Trigger on Timer E period     |
| HRTIM_ADCTRIGGEREVENT24_NONE          | No ADC trigger event              |
| HRTIM_ADCTRIGGEREVENT24_MASTER_CMP1   | ADC Trigger on master compare 1U  |
| HRTIM_ADCTRIGGEREVENT24_MASTER_CMP2   | ADC Trigger on master compare 2U  |
| HRTIM_ADCTRIGGEREVENT24_MASTER_CMP3   | ADC Trigger on master compare 3U  |
| HRTIM_ADCTRIGGEREVENT24_MASTER_CMP4   | ADC Trigger on master compare 4U  |
| HRTIM_ADCTRIGGEREVENT24_MASTER_PERIOD | ADC Trigger on master period      |
| HRTIM_ADCTRIGGEREVENT24_EVENT_6       | ADC Trigger on external event 6U  |
| HRTIM_ADCTRIGGEREVENT24_EVENT_7       | ADC Trigger on external event 7U  |
| HRTIM_ADCTRIGGEREVENT24_EVENT_8       | ADC Trigger on external event 8U  |
| HRTIM_ADCTRIGGEREVENT24_EVENT_9       | ADC Trigger on external event 9U  |
| HRTIM_ADCTRIGGEREVENT24_EVENT_10      | ADC Trigger on external event 10U |
| HRTIM_ADCTRIGGEREVENT24_TIMERA_CMP2   | ADC Trigger on Timer A compare 2U |
| HRTIM_ADCTRIGGEREVENT24_TIMERA_CMP3   | ADC Trigger on Timer A compare 3U |
| HRTIM_ADCTRIGGEREVENT24_TIMERA_CMP4   | ADC Trigger on Timer A compare 4U |
| HRTIM_ADCTRIGGEREVENT24_TIMERA_PERIOD | ADC Trigger on Timer A period     |
| HRTIM_ADCTRIGGEREVENT24_TIMERB_CMP2   | ADC Trigger on Timer B compare 2U |
| HRTIM_ADCTRIGGEREVENT24_TIMERB_CMP3   | ADC Trigger on Timer B compare 3U |
| HRTIM_ADCTRIGGEREVENT24_TIMERB_CMP4   | ADC Trigger on Timer B compare 4U |
| HRTIM_ADCTRIGGEREVENT24_TIMERB_PERIOD | ADC Trigger on Timer B period     |
| HRTIM_ADCTRIGGEREVENT24_TIMERC_CMP2   | ADC Trigger on Timer C compare 2U |
| HRTIM_ADCTRIGGEREVENT24_TIMERC_CMP3   | ADC Trigger on Timer C compare 3U |
| HRTIM_ADCTRIGGEREVENT24_TIMERC_CMP4   | ADC Trigger on Timer C compare 4U |
| HRTIM_ADCTRIGGEREVENT24_TIMERC_PERIOD | ADC Trigger on Timer C period     |
| HRTIM_ADCTRIGGEREVENT24_TIMERC_RESET  | ADC Trigger on Timer C reset      |
| HRTIM_ADCTRIGGEREVENT24_TIMERD_CMP2   | ADC Trigger on Timer D compare    |

|                                       |                                   |
|---------------------------------------|-----------------------------------|
|                                       | 2U                                |
| HRTIM_ADCTRIGGEREVENT24_TIMERD_CMP3   | ADC Trigger on Timer D compare 3U |
| HRTIM_ADCTRIGGEREVENT24_TIMERD_CMP4   | ADC Trigger on Timer D compare 4U |
| HRTIM_ADCTRIGGEREVENT24_TIMERD_PERIOD | ADC Trigger on Timer D period     |
| HRTIM_ADCTRIGGEREVENT24_TIMERD_RESET  | ADC Trigger on Timer D reset      |
| HRTIM_ADCTRIGGEREVENT24_TIMERE_CMP2   | ADC Trigger on Timer E compare 2U |
| HRTIM_ADCTRIGGEREVENT24_TIMERE_CMP3   | ADC Trigger on Timer E compare 3U |
| HRTIM_ADCTRIGGEREVENT24_TIMERE_CMP4   | ADC Trigger on Timer E compare 4U |
| HRTIM_ADCTRIGGEREVENT24_TIMERE_RESET  | ADC Trigger on Timer E reset      |

***HRTIM ADC Trigger Update Source***

|                                |              |
|--------------------------------|--------------|
| HRTIM_ADCTRIGGERUPDATE_MASTER  | Master timer |
| HRTIM_ADCTRIGGERUPDATE_TIMER_A | Timer A      |
| HRTIM_ADCTRIGGERUPDATE_TIMER_B | Timer B      |
| HRTIM_ADCTRIGGERUPDATE_TIMER_C | Timer C      |
| HRTIM_ADCTRIGGERUPDATE_TIMER_D | Timer D      |
| HRTIM_ADCTRIGGERUPDATE_TIMER_E | Timer E      |

***HRTIM Burst DMA Registers Update***

|                     |                                                             |
|---------------------|-------------------------------------------------------------|
| HRTIM_BURSTDMA_NONE | No register is updated by Burst DMA accesses                |
| HRTIM_BURSTDMA_CR   | MCR or TIMxCR register is updated by Burst DMA accesses     |
| HRTIM_BURSTDMA_ICR  | MICR or TIMxICR register is updated by Burst DMA accesses   |
| HRTIM_BURSTDMA_DIER | MDIER or TIMxDIER register is updated by Burst DMA accesses |
| HRTIM_BURSTDMA_CNT  | MCNTR or CNTxCR register is updated by Burst DMA accesses   |
| HRTIM_BURSTDMA_PER  | MPER or PERxR register is updated by Burst DMA accesses     |
| HRTIM_BURSTDMA REP  | MREPR or REPxR register is updated by Burst DMA accesses    |
| HRTIM_BURSTDMA_CMP1 | MCMP1R or CMP1xR register is updated by Burst DMA accesses  |
| HRTIM_BURSTDMA_CMP2 | MCMP2R or CMP2xR register is updated by Burst DMA accesses  |
| HRTIM_BURSTDMA_CMP3 | MCMP3R or CMP3xR register is updated by Burst DMA accesses  |

|                                      |                                                                                         |
|--------------------------------------|-----------------------------------------------------------------------------------------|
| HRTIM_BURSTDMA_CMP4                  | MCMP4R or CMP4xR register is updated by Burst DMA accesses                              |
| HRTIM_BURSTDMA_DTR                   | TDxR register is updated by Burst DMA accesses                                          |
| HRTIM_BURSTDMA_SET1R                 | SET1R register is updated by Burst DMA accesses                                         |
| HRTIM_BURSTDMA_RST1R                 | RST1R register is updated by Burst DMA accesses                                         |
| HRTIM_BURSTDMA_SET2R                 | SET2R register is updated by Burst DMA accesses                                         |
| HRTIM_BURSTDMA_RST2R                 | RST1R register is updated by Burst DMA accesses                                         |
| HRTIM_BURSTDMA_EEFR1                 | EEFxR1 register is updated by Burst DMA accesses                                        |
| HRTIM_BURSTDMA_EEFR2                 | EEFxR2 register is updated by Burst DMA accesses                                        |
| HRTIM_BURSTDMA_RSTR                  | RSTxR register is updated by Burst DMA accesses                                         |
| HRTIM_BURSTDMA_CHPR                  | CHPxR register is updated by Burst DMA accesses                                         |
| HRTIM_BURSTDMA_OUTR                  | OUTxR register is updated by Burst DMA accesses                                         |
| HRTIM_BURSTDMA_FLTR                  | FLTxD register is updated by Burst DMA accesses                                         |
| <b>HRTIM Burst Mode Clock Source</b> |                                                                                         |
| HRTIM_BURSTMODECLOCKSOURCE_MASTER    | Master timer counter reset/roll-over is used as clock source for the burst mode counter |
| HRTIM_BURSTMODECLOCKSOURCE_TIMER_A   | Timer A counter reset/roll-over is used as clock source for the burst mode counter      |
| HRTIM_BURSTMODECLOCKSOURCE_TIMER_B   | Timer B counter reset/roll-over is used as clock source for the burst mode counter      |
| HRTIM_BURSTMODECLOCKSOURCE_TIMER_C   | Timer C counter reset/roll-over is used as clock source for the burst mode counter      |
| HRTIM_BURSTMODECLOCKSOURCE_TIMER_D   | Timer D counter reset/roll-over is used as clock source for the burst mode counter      |
| HRTIM_BURSTMODECLOCKSOURCE_TIMER_E   | Timer E counter reset/roll-over is used as clock source for the burst mode counter      |
| HRTIM_BURSTMODECLOCKSOURCE_TIM16_OC  | On-chip Event 1 (BMClk[1]), acting as a burst mode counter clock                        |
| HRTIM_BURSTMODECLOCKSOURCE_TIM17_OC  | On-chip Event 2 (BMClk[2]), acting as a burst mode counter clock                        |
| HRTIM_BURSTMODECLOCKSOURCE_TIM7_TRGO | On-chip Event 3 (BMClk[3]), acting as a burst mode counter clock                        |
| HRTIM_BURSTMODECLOCKSOURCE_FHRTIM    | Prescaled fHRTIM clock is used as clock source for the burst mode counter               |

***HRTIM Burst Mode Control***

HRTIM\_BURSTMODECTL\_DISABLED      Burst mode disabled

HRTIM\_BURSTMODECTL\_ENABLED      Burst mode enabled

***HRTIM Burst Mode Operating Mode***

HRTIM\_BURSTMODE\_SINGLESHOT      Burst mode operates in single shot mode

HRTIM\_BURSTMODE\_CONTINOUS      Burst mode operates in continuous mode

***HRTIM Burst Mode Prescaler***

HRTIM\_BURSTMODEPRESCALER\_DIV1       $f_{BRST} = f_{HRTIM}$

HRTIM\_BURSTMODEPRESCALER\_DIV2       $f_{BRST} = f_{HRTIM}/2U$

HRTIM\_BURSTMODEPRESCALER\_DIV4       $f_{BRST} = f_{HRTIM}/4U$

|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|

`_HAL_HRTIM_ENABLE`**Description:**

- Enables or disables the timer counter(s)

**Parameters:**

- `_HANDLE_`: specifies the HRTIM Handle.
- `_TIMERS_`: timers to enable/disable This parameter can be any combinations of the following values:
  - `HRTIM_TIMERID_MASTER`: Master timer identifier
  - `HRTIM_TIMERID_TIMER_A`: Timer A identifier
  - `HRTIM_TIMERID_TIMER_B`: Timer B identifier
  - `HRTIM_TIMERID_TIMER_C`: Timer C identifier
  - `HRTIM_TIMERID_TIMER_D`: Timer D identifier
  - `HRTIM_TIMERID_TIMER_E`: Timer E identifier

**Return value:**

- None

`HRTIM_TAOEN_MASK`  
`HRTIM_TBOEN_MASK`  
`HRTIM_TCOEN_MASK`  
`HRTIM_TDOEN_MASK`  
`HRTIM_TEOEN_MASK`  
`_HAL_HRTIM_DISABLE`  
`_HAL_HRTIM_ENABLE_IT`

**Description:**

- Enables or disables the specified HRTIM common interrupts.

**Parameters:**

- `_HANDLE_`: specifies the HRTIM Handle.
- `_INTERRUPT_`: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - `HRTIM_IT_FLT1`: Fault 1 interrupt enable
  - `HRTIM_IT_FLT2`: Fault 2 interrupt enable
  - `HRTIM_IT_FLT3`: Fault 3 interrupt enable
  - `HRTIM_IT_FLT4`: Fault 4 interrupt enable
  - `HRTIM_IT_FLT5`: Fault 5 interrupt enable
  - `HRTIM_IT_SYSFLT`: System Fault interrupt enable

- HRTIM\_IT\_DLLRDY: DLL ready interrupt enable
- HRTIM\_IT\_BMPER: Burst mode period interrupt enable

**Return value:**

- None

`_HAL_HRTIM_ENABLE_IT`

**Description:**

- Enables or disables the specified HRTIM common interrupts.

**Parameters:**

- `_HANDLE`: specifies the HRTIM Handle.
- `_INTERRUPT`: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - HRTIM\_IT\_FLT1: Fault 1 interrupt enable
  - HRTIM\_IT\_FLT2: Fault 2 interrupt enable
  - HRTIM\_IT\_FLT3: Fault 3 interrupt enable
  - HRTIM\_IT\_FLT4: Fault 4 interrupt enable
  - HRTIM\_IT\_FLT5: Fault 5 interrupt enable
  - HRTIM\_IT\_SYSFLT: System Fault interrupt enable
  - HRTIM\_IT\_DLLRDY: DLL ready interrupt enable
  - HRTIM\_IT\_BMPER: Burst mode period interrupt enable

**Return value:**

- None

`_HAL_HRTIM_DISABLE_IT`

`_HAL_HRTIM_DISABLE_IT`

`_HAL_HRTIM_MASTER_ENABLE_IT`

**Description:**

- Enables or disables the specified HRTIM Master timer interrupts.

**Parameters:**

- `_HANDLE`: specifies the HRTIM Handle.
- `_INTERRUPT`: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - HRTIM\_MASTER\_IT\_MCMP1: Master compare 1 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP2: Master compare 2 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP3: Master

- compare 3 interrupt enable
- HRTIM\_MASTER\_IT\_MCMP4: Master compare 4 interrupt enable
- HRTIM\_MASTER\_IT\_MREP: Master Repetition interrupt enable
- HRTIM\_MASTER\_IT\_SYNC: Synchronization input interrupt enable
- HRTIM\_MASTER\_IT\_UPD: Master update interrupt enable

**Return value:**

- None

`__HAL_HRTIM_MASTER_DISABLE`

`IT`

`__HAL_HRTIM_TIMER_ENABLE_IT`

**Description:**

- Enables or disables the specified HRTIM Timerx interrupts.

**Parameters:**

- `__HANDLE__`: specifies the HRTIM Handle.
- `__TIMER__`: specified the timing unit (Timer A to E)
- `__INTERRUPT__`: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - HRTIM\_TIM\_IT\_CMP1: Timer compare 1 interrupt enable
  - HRTIM\_TIM\_IT\_CMP2: Timer compare 2 interrupt enable
  - HRTIM\_TIM\_IT\_CMP3: Timer compare 3 interrupt enable
  - HRTIM\_TIM\_IT\_CMP4: Timer compare 4 interrupt enable
  - HRTIM\_TIM\_IT REP: Timer repetition interrupt enable
  - HRTIM\_TIM\_IT\_UPD: Timer update interrupt enable
  - HRTIM\_TIM\_IT\_CPT1: Timer capture 1 interrupt enable
  - HRTIM\_TIM\_IT\_CPT2: Timer capture 2 interrupt enable
  - HRTIM\_TIM\_IT\_SET1: Timer output 1 set interrupt enable
  - HRTIM\_TIM\_IT\_RST1: Timer output 1 reset interrupt enable
  - HRTIM\_TIM\_IT\_SET2: Timer output 2 set interrupt enable
  - HRTIM\_TIM\_IT\_RST2: Timer output 2 reset interrupt enable
  - HRTIM\_TIM\_IT\_RST: Timer reset interrupt enable

- HRTIM\_TIM\_IT\_DLYPRT: Timer delay protection interrupt enable

**Return value:**

- None

`_HAL_HRTIM_TIMER_DISABLE_IT`  
`_HAL_HRTIM_GET_ITSTATUS`

**Description:**

- Checks if the specified HRTIM common interrupt source is enabled or disabled.

**Parameters:**

- `_HANDLE_`: specifies the HRTIM Handle.
- `_INTERRUPT_`: specifies the interrupt source to check. This parameter can be one of the following values:
  - HRTIM\_IT\_FLT1: Fault 1 interrupt enable
  - HRTIM\_IT\_FLT2: Fault 2 interrupt enable
  - HRTIM\_IT\_FLT3: Fault 3 enable
  - HRTIM\_IT\_FLT4: Fault 4 enable
  - HRTIM\_IT\_FLT5: Fault 5 enable
  - HRTIM\_IT\_SYSFLT: System Fault interrupt enable
  - HRTIM\_IT\_DLLRDY: DLL ready interrupt enable
  - HRTIM\_IT\_BMPER: Burst mode period interrupt enable

**Return value:**

- The: new state of `_INTERRUPT_` (TRUE or FALSE).

`_HAL_HRTIM_MASTER_GET_IT_STATUS`

**Description:**

- Checks if the specified HRTIM Master interrupt source is enabled or disabled.

**Parameters:**

- `_HANDLE_`: specifies the HRTIM Handle.
- `_INTERRUPT_`: specifies the interrupt source to check. This parameter can be one of the following values:
  - HRTIM\_MASTER\_IT\_MCMP1: Master compare 1 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP2: Master compare 2 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP3: Master compare 3 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP4: Master compare 4 interrupt enable
  - HRTIM\_MASTER\_IT\_MREP: Master Repetition interrupt enable

- HRTIM\_MASTER\_IT\_SYNC:  
Synchronization input interrupt enable
- HRTIM\_MASTER\_IT\_MUPD: Master update interrupt enable

**Return value:**

- The new state of \_\_INTERRUPT\_\_ (TRUE or FALSE).

`__HAL_HRTIM_TIMER_GET_IT_STATUS`

**Description:**

- Checks if the specified HRTIM Timerx interrupt source is enabled or disabled.

**Parameters:**

- `__HANDLE__`: specifies the HRTIM Handle.
- `__TIMER__`: specified the timing unit (Timer A to E)
- `__INTERRUPT__`: specifies the interrupt source to check. This parameter can be one of the following values:
  - HRTIM\_MASTER\_IT\_MCMP1: Master compare 1 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP2: Master compare 2 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP3: Master compare 3 interrupt enable
  - HRTIM\_MASTER\_IT\_MCMP4: Master compare 4 interrupt enable
  - HRTIM\_MASTER\_IT\_MREP: Master Repetition interrupt enable
  - HRTIM\_MASTER\_IT\_SYNC:  
Synchronization input interrupt enable
  - HRTIM\_MASTER\_IT\_MUPD: Master update interrupt enable
  - HRTIM\_TIM\_IT\_CMP1: Timer compare 1 interrupt enable
  - HRTIM\_TIM\_IT\_CMP2: Timer compare 2 interrupt enable
  - HRTIM\_TIM\_IT\_CMP3: Timer compare 3 interrupt enable
  - HRTIM\_TIM\_IT\_CMP4: Timer compare 4 interrupt enable
  - HRTIM\_TIM\_IT REP: Timer repetition interrupt enable
  - HRTIM\_TIM\_IT\_UPD: Timer update interrupt enable
  - HRTIM\_TIM\_IT\_CPT1: Timer capture 1 interrupt enable
  - HRTIM\_TIM\_IT\_CPT2: Timer capture 2 interrupt enable
  - HRTIM\_TIM\_IT\_SET1: Timer output 1 set interrupt enable
  - HRTIM\_TIM\_IT\_RST1: Timer output 1 reset interrupt enable

- HRTIM\_TIM\_IT\_SET2: Timer output 2 set interrupt enable
- HRTIM\_TIM\_IT\_RST2: Timer output 2 reset interrupt enable
- HRTIM\_TIM\_IT\_RST: Timer reset interrupt enable
- HRTIM\_TIM\_IT\_DLYPRT: Timer delay protection interrupt enable

**Return value:**

- The new state of \_\_INTERRUPT\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_HRTIM\\_CLEAR\\_IT](#)**Description:**

- Clears the specified HRTIM common pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the HRTIM Handle.
- \_\_INTERRUPT\_\_: specifies the interrupt pending bit to clear. This parameter can be one of the following values:
  - HRTIM\_IT\_FLT1: Fault 1 interrupt clear flag
  - HRTIM\_IT\_FLT2: Fault 2 interrupt clear flag
  - HRTIM\_IT\_FLT3: Fault 3 clear flag
  - HRTIM\_IT\_FLT4: Fault 4 clear flag
  - HRTIM\_IT\_FLT5: Fault 5 clear flag
  - HRTIM\_IT\_SYSFLT: System Fault interrupt clear flag
  - HRTIM\_IT\_DLLRDY: DLL ready interrupt clear flag
  - HRTIM\_IT\_BMPER: Burst mode period interrupt clear flag

**Return value:**

- None

[\\_\\_HAL\\_HRTIM\\_MASTER\\_CLEAR\\_IT](#)**Description:**

- Clears the specified HRTIM Master pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the HRTIM Handle.
- \_\_INTERRUPT\_\_: specifies the interrupt pending bit to clear. This parameter can be one of the following values:
  - HRTIM\_MASTER\_IT\_MCMP1: Master compare 1 interrupt clear flag
  - HRTIM\_MASTER\_IT\_MCMP2: Master compare 2 interrupt clear flag
  - HRTIM\_MASTER\_IT\_MCMP3: Master compare 3 interrupt clear flag

- HRTIM\_MASTER\_IT\_MCMP4: Master compare 4 interrupt clear flag
- HRTIM\_MASTER\_IT\_MREP: Master Repetition interrupt clear flag
- HRTIM\_MASTER\_IT\_SYNC: Synchronization input interrupt clear flag
- HRTIM\_MASTER\_IT\_MUPD: Master update interrupt clear flag

**Return value:**

- None

**\_HAL\_HRTIM\_TIMER\_CLEAR\_IT****Description:**

- Clears the specified HRTIM Timerx pending flag.

**Parameters:**

- HANDLE: specifies the HRTIM Handle.
- TIMER: specified the timing unit (Timer A to E)
- INTERRUPT: specifies the interrupt pending bit to clear. This parameter can be one of the following values:
  - HRTIM\_TIM\_IT\_CMP1: Timer compare 1 interrupt clear flag
  - HRTIM\_TIM\_IT\_CMP2: Timer compare 2 interrupt clear flag
  - HRTIM\_TIM\_IT\_CMP3: Timer compare 3 interrupt clear flag
  - HRTIM\_TIM\_IT\_CMP4: Timer compare 4 interrupt clear flag
  - HRTIM\_TIM\_IT REP: Timer repetition interrupt clear flag
  - HRTIM\_TIM\_IT\_UPD: Timer update interrupt clear flag
  - HRTIM\_TIM\_IT\_CPT1: Timer capture 1 interrupt clear flag
  - HRTIM\_TIM\_IT\_CPT2: Timer capture 2 interrupt clear flag
  - HRTIM\_TIM\_IT\_SET1: Timer output 1 set interrupt clear flag
  - HRTIM\_TIM\_IT\_RST1: Timer output 1 reset interrupt clear flag
  - HRTIM\_TIM\_IT\_SET2: Timer output 2 set interrupt clear flag
  - HRTIM\_TIM\_IT\_RST2: Timer output 2 reset interrupt clear flag
  - HRTIM\_TIM\_IT\_RST: Timer reset interrupt clear flag
  - HRTIM\_TIM\_IT\_DLYPRT: Timer output 1 delay protection interrupt clear flag

**Return value:**

`_HAL_HRTIM_MASTER_ENABLE_  
DMA`

- None

**Description:**

- Enables or disables the specified HRTIM Master timer DMA requests.

**Parameters:**

- `_HANDLE_`: specifies the HRTIM Handle.
- `_DMA_`: specifies the DMA request to enable or disable. This parameter can be one of the following values:
  - `HRTIM_MASTER_DMA_MCMP1`: Master compare 1 DMA request enable
  - `HRTIM_MASTER_DMA_MCMP2`: Master compare 2 DMA request enable
  - `HRTIM_MASTER_DMA_MCMP3`: Master compare 3 DMA request enable
  - `HRTIM_MASTER_DMA_MCMP4`: Master compare 4 DMA request enable
  - `HRTIM_MASTER_DMA_MREP`: Master Repetition DMA request enable
  - `HRTIM_MASTER_DMA_SYNC`: Synchronization input DMA request enable
  - `HRTIM_MASTER_DMA_MUPD`: Master update DMA request enable

**Return value:**

- None

`_HAL_HRTIM_MASTER_DISABLE  
DMA`

`_HAL_HRTIM_TIMER_ENABLE_  
DMA`

**Description:**

- Enables or disables the specified HRTIM Timerx DMA requests.

**Parameters:**

- `_HANDLE_`: specifies the HRTIM Handle.
- `_TIMER_`: specified the timing unit (Timer A to E)
- `_DMA_`: specifies the DMA request to enable or disable. This parameter can be one of the following values:
  - `HRTIM_TIM_DMA_CMP1`: Timer compare 1 DMA request enable
  - `HRTIM_TIM_DMA_CMP2`: Timer compare 2 DMA request enable
  - `HRTIM_TIM_DMA_CMP3`: Timer compare 3 DMA request enable
  - `HRTIM_TIM_DMA_CMP4`: Timer compare 4 DMA request enable
  - `HRTIM_TIM_DMA REP`: Timer

- repetition DMA resquest enable
- HRTIM\_TIM\_DMA\_UPD: Timer update DMA resquest enable
- HRTIM\_TIM\_DMA\_CPT1: Timer capture 1 DMA resquest enable
- HRTIM\_TIM\_DMA\_CPT2: Timer capture 2 DMA resquest enable
- HRTIM\_TIM\_DMA\_SET1: Timer output 1 set DMA resquest enable
- HRTIM\_TIM\_DMA\_RST1: Timer output 1 reset DMA resquest enable
- HRTIM\_TIM\_DMA\_SET2: Timer output 2 set DMA resquest enable
- HRTIM\_TIM\_DMA\_RST2: Timer output 2 reset DMA resquest enable
- HRTIM\_TIM\_DMA\_RST: Timer reset DMA resquest enable
- HRTIM\_TIM\_DMA\_DLYPRT: Timer delay protection DMA resquest enable

**Return value:**

- None

`_HAL_HRTIM_TIMER_DISABLE_  
DMA`  
`_HAL_HRTIM_GET_FLAG`  
`_HAL_HRTIM_CLEAR_FLAG`  
`_HAL_HRTIM_MASTER_GET_  
FLAG`  
`_HAL_HRTIM_MASTER_CLEAR_  
FLAG`  
`_HAL_HRTIM_TIMER_GET_FLAG`  
`_HAL_HRTIM_TIMER_CLEAR_  
FLAG`  
`_HAL_HRTIM_SETCOUNTER`

**Description:**

- Sets the HRTIM timer Counter Register value on runtime.

**Parameters:**

- `_HANDLE_`: HRTIM Handle.
- `_TIMER_`: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E
- `_COUNTER_`: specifies the Counter Register new value.

**Return value:**

- None

\_\_HAL\_HRTIM\_GETCOUNTER**Description:**

- Gets the HRTIM timer Counter Register value on runtime.

**Parameters:**

- \_\_HANDLE\_\_: HRTIM Handle.
- \_\_TIMER\_\_: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E

**Return value:**

- HRTIM: timer Counter Register value

\_\_HAL\_HRTIM\_SETPERIOD**Description:**

- Sets the HRTIM timer Period value on runtime.

**Parameters:**

- \_\_HANDLE\_\_: HRTIM Handle.
- \_\_TIMER\_\_: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E
- \_\_PERIOD\_\_: specifies the Period Register new value.

**Return value:**

- None

\_\_HAL\_HRTIM\_GETPERIOD**Description:**

- Gets the HRTIM timer Period Register value on runtime.

**Parameters:**

- \_\_HANDLE\_\_: HRTIM Handle.
- \_\_TIMER\_\_: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E

**Return value:**

- timer: Period Register

\_\_HAL\_HRTIM\_SETCLOCK  
PRESCALER**Description:**

- Sets the HRTIM timer clock prescaler value on runtime.

**Parameters:**

- \_\_HANDLE\_\_: HRTIM Handle.
- \_\_TIMER\_\_: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer

- 0x0 to 0x4 for timers A to E
- PRESALER: specifies the clock prescaler new value. This parameter can be one of the following values:
  - HRTIM\_PRESCALERRATIO\_MUL32:  
fHRCK: 4.608 GHz - Resolution: 217 ps  
- Min PWM frequency: 70.3 kHz  
(fHRTIM=144MHz)
  - HRTIM\_PRESCALERRATIO\_MUL16:  
fHRCK: 2.304 GHz - Resolution: 434 ps  
- Min PWM frequency: 35.1 KHz  
(fHRTIM=144MHz)
  - HRTIM\_PRESCALERRATIO\_MUL8:  
fHRCK: 1.152 GHz - Resolution: 868 ps  
- Min PWM frequency: 17.6 kHz  
(fHRTIM=144MHz)
  - HRTIM\_PRESCALERRATIO\_MUL4:  
fHRCK: 576 MHz - Resolution: 1.73 ns -  
Min PWM frequency: 8.8 kHz  
(fHRTIM=144MHz)
  - HRTIM\_PRESCALERRATIO\_MUL2:  
fHRCK: 288 MHz - Resolution: 3.47 ns -  
Min PWM frequency: 4.4 kHz  
(fHRTIM=144MHz)
  - HRTIM\_PRESCALERRATIO\_DIV1:  
fHRCK: 144 MHz - Resolution: 6.95 ns -  
Min PWM frequency: 2.2 kHz  
(fHRTIM=144MHz)
  - HRTIM\_PRESCALERRATIO\_DIV2:  
fHRCK: 72 MHz - Resolution: 13.88 ns-  
Min PWM frequency: 1.1 kHz  
(fHRTIM=144MHz)
  - HRTIM\_PRESCALERRATIO\_DIV4:  
fHRCK: 36 MHz - Resolution: 27.7 ns-  
Min PWM frequency: 550Hz  
(fHRTIM=144MHz)

**Return value:**

- None

**Description:**

- Gets the HRTIM timer clock prescaler value on runtime.

**Parameters:**

- HANDLE: HRTIM Handle.
- TIMER: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E

**Return value:**

- timer: clock prescaler value

[\\_\\_HAL\\_HRTIM\\_SETCOMPARE](#)**Description:**

- Sets the HRTIM timer Compare Register value on runtime.
- Parameters:**
- [\\_\\_HANDLE\\_\\_](#): HRTIM Handle.
  - [\\_\\_TIMER\\_\\_](#): HRTIM timer This parameter can be one of the following values:
    - 0x0 to 0x4 for timers A to E
  - [\\_\\_COMPAREUNIT\\_\\_](#): timer compare unit This parameter can be one of the following values:
    - [HRTIM\\_COMPAREUNIT\\_1](#): Compare unit 1
    - [HRTIM\\_COMPAREUNIT\\_2](#): Compare unit 2
    - [HRTIM\\_COMPAREUNIT\\_3](#): Compare unit 3
    - [HRTIM\\_COMPAREUNIT\\_4](#): Compare unit 4
  - [\\_\\_COMPARE\\_\\_](#): specifies the Compare new value.

**Return value:**

- None

[\\_\\_HAL\\_HRTIM\\_GETCOMPARE](#)**Description:**

- Gets the HRTIM timer Compare Register value on runtime.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): HRTIM Handle.
- [\\_\\_TIMER\\_\\_](#): HRTIM timer This parameter can be one of the following values:
  - 0x0 to 0x4 for timers A to E
- [\\_\\_COMPAREUNIT\\_\\_](#): timer compare unit This parameter can be one of the following values:
  - [HRTIM\\_COMPAREUNIT\\_1](#): Compare unit 1
  - [HRTIM\\_COMPAREUNIT\\_2](#): Compare unit 2
  - [HRTIM\\_COMPAREUNIT\\_3](#): Compare unit 3
  - [HRTIM\\_COMPAREUNIT\\_4](#): Compare unit 4

**Return value:**

- Compare: value

***HRTIM External Event Channels***

|                  |                                      |
|------------------|--------------------------------------|
| HRTIM_EVENT_NONE | Undefined event channel              |
| HRTIM_EVENT_1    | External event channel 1 identifier  |
| HRTIM_EVENT_2    | External event channel 2 identifier  |
| HRTIM_EVENT_3    | External event channel 3 identifier  |
| HRTIM_EVENT_4    | External event channel 4 identifier  |
| HRTIM_EVENT_5    | External event channel 5 identifier  |
| HRTIM_EVENT_6    | External event channel 6 identifier  |
| HRTIM_EVENT_7    | External event channel 7 identifier  |
| HRTIM_EVENT_8    | External event channel 8 identifier  |
| HRTIM_EVENT_9    | External event channel 9 identifier  |
| HRTIM_EVENT_10   | External event channel 10 identifier |

***HRTIM External Event Fast Mode***

|                             |                                                                               |
|-----------------------------|-------------------------------------------------------------------------------|
| HRTIM_EVENTFASTMODE_ENABLE  | External Event is re-synchronized by the HRTIM logic before acting on outputs |
| HRTIM_EVENTFASTMODE_DISABLE | External Event is acting asynchronously on outputs (low latency mode)         |

***HRTIM External Event Filter***

|                        |                            |
|------------------------|----------------------------|
| HRTIM_EVENTFILTER_NONE | Filter disabled            |
| HRTIM_EVENTFILTER_1    | fSAMPLING= fHRTIM, N=2U    |
| HRTIM_EVENTFILTER_2    | fSAMPLING= fHRTIM, N=4U    |
| HRTIM_EVENTFILTER_3    | fSAMPLING= fHRTIM, N=8U    |
| HRTIM_EVENTFILTER_4    | fSAMPLING= fEEVS/2U, N=6U  |
| HRTIM_EVENTFILTER_5    | fSAMPLING= fEEVS/2U, N=8U  |
| HRTIM_EVENTFILTER_6    | fSAMPLING= fEEVS/4U, N=6U  |
| HRTIM_EVENTFILTER_7    | fSAMPLING= fEEVS/4U, N=8U  |
| HRTIM_EVENTFILTER_8    | fSAMPLING= fEEVS/8U, N=6U  |
| HRTIM_EVENTFILTER_9    | fSAMPLING= fEEVS/8U, N=8U  |
| HRTIM_EVENTFILTER_10   | fSAMPLING= fEEVS/16U, N=5U |
| HRTIM_EVENTFILTER_11   | fSAMPLING= fEEVS/16U, N=6U |
| HRTIM_EVENTFILTER_12   | fSAMPLING= fEEVS/16U, N=8U |
| HRTIM_EVENTFILTER_13   | fSAMPLING= fEEVS/32U, N=5U |
| HRTIM_EVENTFILTER_14   | fSAMPLING= fEEVS/32U, N=6U |
| HRTIM_EVENTFILTER_15   | fSAMPLING= fEEVS/32U, N=8U |

***HRTIM External Event Polarity***

|                          |                               |
|--------------------------|-------------------------------|
| HRTIM_EVENTPOLARITY_HIGH | External event is active high |
| HRTIM_EVENTPOLARITY_LOW  | External event is active low  |

***HRTIM External Event Prescaler***

|                           |                   |
|---------------------------|-------------------|
| HRTIM_EVENTPRESCALER_DIV1 | fEEVS=fHRTIM      |
| HRTIM_EVENTPRESCALER_DIV2 | fEEVS=fHRTIM / 2U |
| HRTIM_EVENTPRESCALER_DIV4 | fEEVS=fHRTIM / 4U |
| HRTIM_EVENTPRESCALER_DIV8 | fEEVS=fHRTIM / 8U |

***HRTIM External Event Sensitivity***

|                                    |                                                      |
|------------------------------------|------------------------------------------------------|
| HRTIM_EVENTSensitivity_LEVEL       | External event is active on level                    |
| HRTIM_EVENTSensitivity_RISINGEDGE  | External event is active on Rising edge              |
| HRTIM_EVENTSensitivity_FALLINGEDGE | External event is active on Falling edge             |
| HRTIM_EVENTSensitivity_BOTHEDGES   | External event is active on Rising and Falling edges |

***HRTIM External Event Sources***

|                  |                          |
|------------------|--------------------------|
| HRTIM_EVENTSRC_1 | External event source 1U |
| HRTIM_EVENTSRC_2 | External event source 2U |
| HRTIM_EVENTSRC_3 | External event source 3U |
| HRTIM_EVENTSRC_4 | External event source 4U |

***HRTIM External Fault Prescaler***

|                           |                   |
|---------------------------|-------------------|
| HRTIM_FAULTPRESCALER_DIV1 | fFLTS=fHRTIM      |
| HRTIM_FAULTPRESCALER_DIV2 | fFLTS=fHRTIM / 2U |
| HRTIM_FAULTPRESCALER_DIV4 | fFLTS=fHRTIM / 4U |
| HRTIM_FAULTPRESCALER_DIV8 | fFLTS=fHRTIM / 8U |

***HRTIM Fault Channel***

|               |                            |
|---------------|----------------------------|
| HRTIM_FAULT_1 | Fault channel 1 identifier |
| HRTIM_FAULT_2 | Fault channel 2 identifier |
| HRTIM_FAULT_3 | Fault channel 3 identifier |
| HRTIM_FAULT_4 | Fault channel 4 identifier |
| HRTIM_FAULT_5 | Fault channel 5 identifier |

***HRTIM Fault Filter***

| HRTIM_FAULTLOCK_READWRITE                     | Fault settings bits are read/write                                            |
| HRTIM_FAULTLOCK_READONLY                      | Fault settings bits are read only                                             |
| <b><i>HRTIM Fault Mode Control</i></b>        |                                                                               |
| HRTIM_FAULTMODECTL_DISABLED                   | Fault channel is disabled                                                     |
| HRTIM_FAULTMODECTL_ENABLED                    | Fault channel is enabled                                                      |
| IS_HRTIM_FAULTMODECTL                         |                                                                               |
| <b><i>HRTIM Fault Polarity</i></b>            |                                                                               |
| HRTIM_FAULTPOLARITY_LOW                       | Fault input is active low                                                     |
| HRTIM_FAULTPOLARITY_HIGH                      | Fault input is active high                                                    |
| <b><i>HRTIM Fault Sources</i></b>             |                                                                               |
| HRTIM_FAULTSOURCE_DIGITALINPUT                | Fault input is FLT input pin                                                  |
| HRTIM_FAULTSOURCE_INTERNAL                    | Fault input is FLT_Int signal (e.g. internal comparator)                      |
| <b><i>HRTIM Half Mode Enable</i></b>          |                                                                               |
| HRTIM_HALFMODE_DISABLED                       | Half mode is disabled                                                         |
| HRTIM_HALFMODE_ENABLED                        | Half mode is enabled                                                          |
| <b><i>HRTIM Idle Push Pull Status</i></b>     |                                                                               |
| HRTIM_PUSHPULL_IDLESTATUS_OUTPUT1             | Protection occurred when the output 1 was active and output 2 forced inactive |
| HRTIM_PUSHPULL_IDLESTATUS_OUTPUT2             | Protection occurred when the output 2 was active and output 1 forced inactive |
| <b><i>HRTIM Master DMA Request Enable</i></b> |                                                                               |
| HRTIM_MASTER_DMA_NONE                         | No DMA request enable                                                         |
| HRTIM_MASTER_DMA_MCMP1                        | Master compare 1 DMA request enable                                           |
| HRTIM_MASTER_DMA_MCMP2                        | Master compare 2 DMA request enable                                           |
| HRTIM_MASTER_DMA_MCMP3                        | Master compare 3 DMA request enable                                           |
| HRTIM_MASTER_DMA_MCMP4                        | Master compare 4 DMA request enable                                           |
| HRTIM_MASTER_DMA_MREP                         | Master Repetition DMA request enable                                          |
| HRTIM_MASTER_DMA_SYNC                         | Synchronization input DMA request enable                                      |

**HRTIM\_MASTER\_DMA\_MUPD** Master update DMA request enable

***HRTIM Master Interrupt Enable***

**HRTIM\_MASTER\_IT\_NONE** No interrupt enabled

**HRTIM\_MASTER\_IT\_MCMP1** Master compare 1 interrupt enable

**HRTIM\_MASTER\_IT\_MCMP2** Master compare 2 interrupt enable

**HRTIM\_MASTER\_IT\_MCMP3** Master compare 3 interrupt enable

**HRTIM\_MASTER\_IT\_MCMP4** Master compare 4 interrupt enable

**HRTIM\_MASTER\_IT\_MREP** Master Repetition interrupt enable

**HRTIM\_MASTER\_IT\_SYNC** Synchronization input interrupt enable

**HRTIM\_MASTER\_IT\_MUPD** Master update interrupt enable

***HRTIM Master Interrupt Flag***

**HRTIM\_MASTER\_FLAG\_MCMP1** Master compare 1 interrupt flag

**HRTIM\_MASTER\_FLAG\_MCMP2** Master compare 2 interrupt flag

**HRTIM\_MASTER\_FLAG\_MCMP3** Master compare 3 interrupt flag

**HRTIM\_MASTER\_FLAG\_MCMP4** Master compare 4 interrupt flag

**HRTIM\_MASTER\_FLAG\_MREP** Master Repetition interrupt flag

**HRTIM\_MASTER\_FLAG\_SYNC** Synchronization input interrupt flag

**HRTIM\_MASTER\_FLAG\_MUPD** Master update interrupt flag

***HRTIM Max Timer***

**MAX\_HRTIM\_TIMER**

***HRTIM Output Burst Mode Entry Delayed***

**HRTIM\_OUTPUTBURSTMODEENTRY\_REGULAR** The programmed Idle state is applied immediately to the Output

**HRTIM\_OUTPUTBURSTMODEENTRY\_DELAYED** Deadtime is inserted on output before entering the idle mode

***HRTIM Output Chopper Mode Enable***

**HRTIM\_OUTPUTCHOPPERMODE\_DISABLED** Output signal is not altered

**HRTIM\_OUTPUTCHOPPERMODE\_ENABLED** Output signal is chopped by a carrier signal

***HRTIM Output FAULT Level***

**HRTIM\_OUTPUTFAULTLEVEL\_NONE** The output is not affected by the fault input

**HRTIM\_OUTPUTFAULTLEVEL\_ACTIVE** Output at active level when in FAULT state

**HRTIM\_OUTPUTFAULTLEVEL\_INACTIVE** Output at inactive level when in FAULT state

**HRTIM\_OUTPUTFAULTLEVEL\_HIGHZ** Output is tri-stated when in FAULT state

***HRTIM Output IDLE Level***

**HRTIM\_OUTPUTIDLELEVEL\_INACTIVE** Output at inactive level when in IDLE state

**HRTIM\_OUTPUTIDLELEVEL\_ACTIVE** Output at active level when in IDLE state

***HRTIM Output Idle Mode***

|                           |                                                                         |
|---------------------------|-------------------------------------------------------------------------|
| HRTIM_OUTPUTIDLEMODE_NONE | The output is not affected by the burst mode operation                  |
| HRTIM_OUTPUTIDLEMODE_IDLE | The output is in idle state when requested by the burst mode controller |

***HRTIM Output Level***

|                             |                                         |
|-----------------------------|-----------------------------------------|
| HRTIM_OUTPUTLEVEL_ACTIVE    | Forces the output to its active state   |
| HRTIM_OUTPUTLEVEL_INACTIVE  | Forces the output to its inactive state |
| <b>IS_HRTIM_OUTPUTLEVEL</b> |                                         |

***HRTIM Output Polarity***

|                           |                       |
|---------------------------|-----------------------|
| HRTIM_OUTPUTPOLARITY_HIGH | Output is active HIGH |
| HRTIM_OUTPUTPOLARITY_LOW  | Output is active LOW  |

***HRTIM Output Reset Source***

|                              |                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------|
| HRTIM_OUTPUTRESET_NONE       | Reset the output reset crossbar                                                                     |
| HRTIM_OUTPUTRESET_RESYNC     | Timer reset event coming solely from software or SYNC input forces the output to its inactive state |
| HRTIM_OUTPUTRESET_TIMPER     | Timer period event forces the output to its inactive state                                          |

| <b><i>HRTIM Reset On Sync Input Event</i></b> |                                                                                                                                 |
| HRTIM_SYNCRESET_DISABLED                      | Synchronization input event has effect on the timer                                                                             |

|                                                  |                                                                                          |
|--------------------------------------------------|------------------------------------------------------------------------------------------|
| <code>HRTIM_SYNCRESET_ENABLED</code>             | Synchronization input event resets the timer                                             |
| <b><i>HRTIM Simple OC Mode</i></b>               |                                                                                          |
| <code>HRTIM_BASICOCMODE_TOGGLE</code>            | Output toggles when the timer counter reaches the compare value                          |
| <code>HRTIM_BASICOCMODE_INACTIVE</code>          | Output forced to active level when the timer counter reaches the compare value           |
| <code>HRTIM_BASICOCMODE_ACTIVE</code>            | Output forced to inactive level when the timer counter reaches the compare value         |
| <code>IS_HRTIM_BASICOCMODE</code>                |                                                                                          |
| <b><i>HRTIM Software Timer Reset</i></b>         |                                                                                          |
| <code>HRTIM_TIMERRESET_MASTER</code>             | Resets the master timer counter                                                          |
| <code>HRTIM_TIMERRESET_TIMER_A</code>            | Resets the timer A counter                                                               |
| <code>HRTIM_TIMERRESET_TIMER_B</code>            | Resets the timer B counter                                                               |
| <code>HRTIM_TIMERRESET_TIMER_C</code>            | Resets the timer C counter                                                               |
| <code>HRTIM_TIMERRESET_TIMER_D</code>            | Resets the timer D counter                                                               |
| <code>HRTIM_TIMERRESET_TIMER_E</code>            | Resets the timer E counter                                                               |
| <b><i>HRTIM Software Timer Update</i></b>        |                                                                                          |
| <code>HRTIM_TIMERUPDATE_MASTER</code>            | Forces an immediate transfer from the preload to the active register in the master timer |
| <code>HRTIM_TIMERUPDATE_A</code>                 | Forces an immediate transfer from the preload to the active register in the timer A      |
| <code>HRTIM_TIMERUPDATE_B</code>                 | Forces an immediate transfer from the preload to the active register in the timer B      |
| <code>HRTIM_TIMERUPDATE_C</code>                 | Forces an immediate transfer from the preload to the active register in the timer C      |
| <code>HRTIM_TIMERUPDATE_D</code>                 | Forces an immediate transfer from the preload to the active register in the timer D      |
| <code>HRTIM_TIMERUPDATE_E</code>                 | Forces an immediate transfer from the preload to the active register in the timer E      |
| <b><i>HRTIM Start On Sync Input Event</i></b>    |                                                                                          |
| <code>HRTIM_SYNCSTART_DISABLED</code>            | Synchronization input event has effect on the timer                                      |
| <code>HRTIM_SYNCSTART_ENABLED</code>             | Synchronization input event starts the timer                                             |
| <b><i>HRTIM Synchronization Input Source</i></b> |                                                                                          |
| <code>HRTIM_SYNCINPUTSOURCE_NONE</code>          | disabled. HRTIM is not synchronized and runs in standalone mode                          |
| <code>HRTIM_SYNCINPUTSOURCE_INTERNALEVENT</code> | The HRTIM is synchronized with the on-chip timer                                         |
| <code>HRTIM_SYNCINPUTSOURCE_EXTERNALEVENT</code> | A positive pulse on SYNCIN input triggers the HRTIM                                      |

***HRTIM Synchronization Options***

|                         |                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------|
| HRTIM_SYNCOPTION_NONE   | HRTIM instance doesn't handle external synchronization signals (SYNCIN, SYNCOUT)          |
| HRTIM_SYNCOPTION_MASTER | HRTIM instance acts as a MASTER, i.e. generates external synchronization output (SYNCOUT) |
| HRTIM_SYNCOPTION_SLAVE  | HRTIM instance acts as a SLAVE, i.e. it is synchronized by external sources (SYNCIN)      |

***HRTIM Synchronization Output Polarity***

|                                   |                                                                                                                      |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------|
| HRTIM_SYNCOUTPUTPOLARITY_NONE     | Synchronization output event is disabled                                                                             |
| HRTIM_SYNCOUTPUTPOLARITY_POSITIVE | SCOUT pin has a low idle level and issues a positive pulse of 16 fHRTIM clock cycles length for the synchronization  |
| HRTIM_SYNCOUTPUTPOLARITY_NEGATIVE | SCOUT pin has a high idle level and issues a negative pulse of 16 fHRTIM clock cycles length for the synchronization |

***HRTIM Synchronization Output Source***

|                                     |                                                                          |
|-------------------------------------|--------------------------------------------------------------------------|
| HRTIM_SYNCOUTPUTSOURCE_MASTER_START | A pulse is sent on the SYNCOUT output upon master timer start event      |
| HRTIM_SYNCOUTPUTSOURCE_MASTER_CMP1  | A pulse is sent on the SYNCOUT output upon master timer compare 1 event  |
| HRTIM_SYNCOUTPUTSOURCE_TIMA_START   | A pulse is sent on the SYNCOUT output upon timer A start or reset events |
| HRTIM_SYNCOUTPUTSOURCE_TIMA_CMP1    | A pulse is sent on the SYNCOUT output upon timer A compare 1 event       |

***HRTIM Timer Burst Mode***

|                                    |                                                                   |
|------------------------------------|-------------------------------------------------------------------|
| HRTIM_TIMERBURSTMODE_MAINTAINCLOCK | Timer counter clock is maintained and the timer operates normally |
| HRTIM_TIMERBURSTMODE_RESETCOUNTER  | Timer counter clock is stopped and the counter is reset           |

***HRTIM Timer Deadtime Insertion***

|                                     |                                                     |
|-------------------------------------|-----------------------------------------------------|
| HRTIM_TIMDEADTIMEINSERTION_DISABLED | Output 1 and output 2 signals are independent       |
| HRTIM_TIMDEADTIMEINSERTION_ENABLED  | Deadtime is inserted between output 1 and output 2U |

***HRTIM Timer Delayed Protection Mode***

|                                             |           |
|---------------------------------------------|-----------|
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DISABLE | No action |
|---------------------------------------------|-----------|

|                                                       |                                                                         |
|-------------------------------------------------------|-------------------------------------------------------------------------|
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT1_EEV6  | Timers A, B, C: Output 1 delayed Idle on external Event 6U              |
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT2_EEV6  | Timers A, B, C: Output 2 delayed Idle on external Event 6U              |
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDBOTH_EEV6  | Timers A, B, C: Output 1 and output 2 delayed Idle on external Event 6U |
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_BALANCED_EEV6     | Timers A, B, C: Balanced Idle on external Event 6U                      |
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT1_DEEV7 | Timers A, B, C: Output 1 delayed Idle on external Event 7U              |
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT2_DEEV7 | Timers A, B, C: Output 2 delayed Idle on external Event 7U              |
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDBOTH_EEV7  | Timers A, B, C: Output 1 and output2 delayed Idle on external Event 7U  |
| HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_BALANCED_EEV7     | Timers A, B, C: Balanced Idle on external Event 7U                      |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_DISABLED            | No action                                                               |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT1_EEV8    | Timers D, E: Output 1 delayed Idle on external Event 6U                 |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT2_EEV8    | Timers D, E: Output 2 delayed Idle on external Event 6U                 |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDBOTH_EEV8    | Timers D, E: Output 1 and output 2 delayed Idle on external Event 6U    |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_BALANCED_EEV8       | Timers D, E: Balanced Idle on external Event 6U                         |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT1_DEEV9   | Timers D, E: Output 1 delayed Idle on external Event 7U                 |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT2_DEEV9   | Timers D, E: Output 2 delayed Idle on external Event 7U                 |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDBOTH_EEV9    | Timers D, E: Output 1 and output2 delayed Idle on external Event 7U     |
| HRTIM_TIMER_D_E_DELAYEDPROTECTION_BALANCED_EEV9       | Timers D, E: Balanced Idle on external Event 7U                         |
| <b>HRTIM Timer External Event Filter</b>              |                                                                         |
| HRTIM_TIMEVENTFILTER_NONE                             |                                                                         |
| HRTIM_TIMEVENTFILTER_BLANKINGCMP1                     | Blanking from counter reset/roll-over to Compare 1U                     |
| HRTIM_TIMEVENTFILTER_BLANKINGCMP2                     | Blanking from counter reset/roll-over to Compare 2U                     |
| HRTIM_TIMEVENTFILTER_BLANKINGCMP3                     | Blanking from counter reset/roll-over to Compare 3U                     |

|                                    |                                                      |
|------------------------------------|------------------------------------------------------|
| HRTIM_TIMEVENTFILTER_BLANKINGCMP4  | Blanking from counter reset/roll-over to Compare 4U  |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR1 | Blanking from another timing unit: TIMFLTR1 source   |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR2 | Blanking from another timing unit: TIMFLTR2 source   |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR3 | Blanking from another timing unit: TIMFLTR3 source   |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR4 | Blanking from another timing unit: TIMFLTR4 source   |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR5 | Blanking from another timing unit: TIMFLTR5 source   |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR6 | Blanking from another timing unit: TIMFLTR6 source   |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR7 | Blanking from another timing unit: TIMFLTR7 source   |
| HRTIM_TIMEVENTFILTER_BLANKINGFLTR8 | Blanking from another timing unit: TIMFLTR8 source   |
| HRTIM_TIMEVENTFILTER_WINDOWINGCMP2 | Windowing from counter reset/roll-over to Compare 2U |
| HRTIM_TIMEVENTFILTER_WINDOWINGCMP3 | Windowing from counter reset/roll-over to Compare 3U |
| HRTIM_TIMEVENTFILTER_WINDOWINGTIM  | Windowing from another timing unit: TIMWIN source    |

#### ***HRTIM Timer External Event Latch***

|                              |                                                                                  |
|------------------------------|----------------------------------------------------------------------------------|
| HRTIM_TIMEVENTLATCH_DISABLED | Event is ignored if it happens during a blank, or passed through during a window |
| HRTIM_TIMEVENTLATCH_ENABLED  | Event is latched and delayed till the end of the blanking or windowing period    |

#### ***HRTIM Timer Fault Enabling***

|                             |                  |
|-----------------------------|------------------|
| HRTIM_TIMFAULTENABLE_NONE   | No fault enabled |
| HRTIM_TIMFAULTENABLE_FAULT1 | Fault 1 enabled  |
| HRTIM_TIMFAULTENABLE_FAULT2 | Fault 2 enabled  |
| HRTIM_TIMFAULTENABLE_FAULT3 | Fault 3 enabled  |
| HRTIM_TIMFAULTENABLE_FAULT4 | Fault 4 enabled  |
| HRTIM_TIMFAULTENABLE_FAULT5 | Fault 5 enabled  |

#### ***HRTIM Timer Fault Lock***

|                              |                                          |
|------------------------------|------------------------------------------|
| HRTIM_TIMFAULTLOCK_READWRITE | Timer fault enabling bits are read/write |
| HRTIM_TIMFAULTLOCK_READONLY  | Timer fault enabling bits are read only  |

#### ***HRTIM Timer identifier***

|                      |                   |
|----------------------|-------------------|
| HRTIM_TIMERID_MASTER | Master identifier |
|----------------------|-------------------|

---

|                       |                    |
|-----------------------|--------------------|
| HRTIM_TIMERID_TIMER_A | Timer A identifier |
| HRTIM_TIMERID_TIMER_B | Timer B identifier |
| HRTIM_TIMERID_TIMER_C | Timer C identifier |
| HRTIM_TIMERID_TIMER_D | Timer D identifier |
| HRTIM_TIMERID_TIMER_E | Timer E identifier |

#### ***HRTIM Timer Index***

|                          |                                             |
|--------------------------|---------------------------------------------|
| HRTIM_TIMERINDEX_TIMER_A | Index used to access timer A registers      |
| HRTIM_TIMERINDEX_TIMER_B | Index used to access timer B registers      |
| HRTIM_TIMERINDEX_TIMER_C | Index used to access timer C registers      |
| HRTIM_TIMERINDEX_TIMER_D | Index used to access timer D registers      |
| HRTIM_TIMERINDEX_TIMER_E | Index used to access timer E registers      |
| HRTIM_TIMERINDEX_MASTER  | Index used to access master registers       |
| HRTIM_TIMERINDEX_COMMON  | Index used to access HRTIM common registers |

#### ***HRTIM Timer Output***

|                  |                               |
|------------------|-------------------------------|
| HRTIM_OUTPUT_TA1 | Timer A - Output 1 identifier |
| HRTIM_OUTPUT_TA2 | Timer A - Output 2 identifier |
| HRTIM_OUTPUT_TB1 | Timer B - Output 1 identifier |
| HRTIM_OUTPUT_TB2 | Timer B - Output 2 identifier |
| HRTIM_OUTPUT_TC1 | Timer C - Output 1 identifier |
| HRTIM_OUTPUT_TC2 | Timer C - Output 2 identifier |
| HRTIM_OUTPUT_TD1 | Timer D - Output 1 identifier |
| HRTIM_OUTPUT_TD2 | Timer D - Output 2 identifier |
| HRTIM_OUTPUT_TE1 | Timer E - Output 1 identifier |
| HRTIM_OUTPUT_TE2 | Timer E - Output 2 identifier |

#### ***HRTIM Timer Push Pull Mode***

|                                |                         |
|--------------------------------|-------------------------|
| HRTIM_TIMPUSHPULLMODE_DISABLED | Push-Pull mode disabled |
| HRTIM_TIMPUSHPULLMODE_ENABLED  | Push-Pull mode enabled  |

#### ***HRTIM Timer Repetition Update***

|                                   |                               |
|-----------------------------------|-------------------------------|
| HRTIM_UPDATEONREPETITION_DISABLED | Update on repetition disabled |
| HRTIM_UPDATEONREPETITION_ENABLED  | Update on repetition enabled  |

#### ***HRTIM Timer Reset Trigger***

|                              |                                                       |
|------------------------------|-------------------------------------------------------|
| HRTIM_TIMRESETTRIGGER_NONE   | No counter reset trigger                              |
| HRTIM_TIMRESETTRIGGER_UPDATE | The timer counter is reset upon update event          |
| HRTIM_TIMRESETTRIGGER_CMP2   | The timer counter is reset upon Timer Compare 2 event |
| HRTIM_TIMRESETTRIGGER_CMP4   | The timer counter is reset upon Timer                 |

|                                   |                                                              |
|-----------------------------------|--------------------------------------------------------------|
|                                   | Compare 4 event                                              |
| HRTIM_TIMRESETTRIGGER_MASTER_PER  | The timer counter is reset upon master timer period event    |
| HRTIM_TIMRESETTRIGGER_MASTER_CMP1 | The timer counter is reset upon master timer Compare 1 event |
| HRTIM_TIMRESETTRIGGER_MASTER_CMP2 | The timer counter is reset upon master timer Compare 2 event |
| HRTIM_TIMRESETTRIGGER_MASTER_CMP3 | The timer counter is reset upon master timer Compare 3 event |
| HRTIM_TIMRESETTRIGGER_MASTER_CMP4 | The timer counter is reset upon master timer Compare 4 event |

## 24 HAL I2C Generic Driver

### 24.1 I2C Firmware driver registers structures

#### 24.1.1 I2C\_InitTypeDef

##### Data Fields

- *uint32\_t Timing*
- *uint32\_t OwnAddress1*
- *uint32\_t AddressingMode*
- *uint32\_t DualAddressMode*
- *uint32\_t OwnAddress2*
- *uint32\_t OwnAddress2Masks*
- *uint32\_t GeneralCallMode*
- *uint32\_t NoStretchMode*

##### Field Documentation

- ***uint32\_t I2C\_InitTypeDef::Timing***  
Specifies the I2C\_TIMINGR\_register value. This parameter calculated by referring to I2C initialization section in Reference manual
- ***uint32\_t I2C\_InitTypeDef::OwnAddress1***  
Specifies the first device own address. This parameter can be a 7-bit or 10-bit address.
- ***uint32\_t I2C\_InitTypeDef::AddressingMode***  
Specifies if 7-bit or 10-bit addressing mode is selected. This parameter can be a value of **I2C\_ADDRESSING\_MODE**
- ***uint32\_t I2C\_InitTypeDef::DualAddressMode***  
Specifies if dual addressing mode is selected. This parameter can be a value of **I2C\_DUAL\_ADDRESSING\_MODE**
- ***uint32\_t I2C\_InitTypeDef::OwnAddress2***  
Specifies the second device own address if dual addressing mode is selected. This parameter can be a 7-bit address.
- ***uint32\_t I2C\_InitTypeDef::OwnAddress2Masks***  
Specifies the acknowledge mask address second device own address if dual addressing mode is selected. This parameter can be a value of **I2C\_OWN\_ADDRESS2\_MASKS**
- ***uint32\_t I2C\_InitTypeDef::GeneralCallMode***  
Specifies if general call mode is selected. This parameter can be a value of **I2C\_GENERAL\_CALL\_ADDRESSING\_MODE**
- ***uint32\_t I2C\_InitTypeDef::NoStretchMode***  
Specifies if nostretch mode is selected. This parameter can be a value of **I2C\_NOSTRETCH\_MODE**

#### 24.1.2 I2C\_HandleTypeDef

##### Data Fields

- *I2C\_TypeDef \* Instance*
- *I2C\_InitTypeDef Init*
- *uint8\_t \* pBuffPtr*
- *uint16\_t XferSize*
- *\_\_IO uint16\_t XferCount*

- `__IO uint32_t XferOptions`
- `__IO uint32_t PreviousState`
- `HAL_StatusTypeDef(* XferISR`
- `DMA_HandleTypeDef * hdmatx`
- `DMA_HandleTypeDef * hdmarx`
- `HAL_LockTypeDef Lock`
- `__IO HAL_I2C_StateTypeDef State`
- `__IO HAL_I2C_ModeTypeDef Mode`
- `__IO uint32_t ErrorCode`
- `__IO uint32_t AddrEventCount`

#### Field Documentation

- `I2C_HandleTypeDef* __I2C_HandleTypeDef::Instance`  
I2C registers base address
- `I2C_InitTypeDef __I2C_HandleTypeDef::Init`  
I2C communication parameters
- `uint8_t* __I2C_HandleTypeDef::pBuffPtr`  
Pointer to I2C transfer buffer
- `uint16_t __I2C_HandleTypeDef::XferSize`  
I2C transfer size
- `__IO uint16_t __I2C_HandleTypeDef::XferCount`  
I2C transfer counter
- `__IO uint32_t __I2C_HandleTypeDef::XferOptions`  
I2C sequential transfer options, this parameter can be a value of `I2C_XFEROPTIONS`
- `__IO uint32_t __I2C_HandleTypeDef::PreviousState`  
I2C communication Previous state
- `HAL_StatusTypeDef(* __I2C_HandleTypeDef::XferISR)(struct __I2C_HandleTypeDef *hi2c, uint32_t ITFlags, uint32_t ITSources)`  
I2C transfer IRQ handler function pointer
- `DMA_HandleTypeDef* __I2C_HandleTypeDef::hdmatx`  
I2C Tx DMA handle parameters
- `DMA_HandleTypeDef* __I2C_HandleTypeDef::hdmarx`  
I2C Rx DMA handle parameters
- `HAL_LockTypeDef __I2C_HandleTypeDef::Lock`  
I2C locking object
- `__IO HAL_I2C_StateTypeDef __I2C_HandleTypeDef::State`  
I2C communication state
- `__IO HAL_I2C_ModeTypeDef __I2C_HandleTypeDef::Mode`  
I2C communication mode
- `__IO uint32_t __I2C_HandleTypeDef::ErrorCode`  
I2C Error code
- `__IO uint32_t __I2C_HandleTypeDef::AddrEventCount`  
I2C Address Event counter

## 24.2 I2C Firmware driver API description

### 24.2.1 How to use this driver

The I2C HAL driver can be used as follows:

1. Declare a `I2C_HandleTypeDef` handle structure, for example: `I2C_HandleTypeDef hi2c;`
2. Initialize the I2C low level resources by implementing the `HAL_I2C_MspInit()` API:
  - a. Enable the I2Cx interface clock

- b. I2C pins configuration
  - Enable the clock for the I2C GPIOs
  - Configure I2C pins as alternate function open-drain
- c. NVIC configuration if you need to use interrupt process
  - Configure the I2Cx interrupt priority
  - Enable the NVIC I2C IRQ Channel
- d. DMA Configuration if you need to use DMA process
  - Declare a DMA\_HandleTypeDef handle structure for the transmit or receive channel
  - Enable the DMAx interface clock using
  - Configure the DMA handle parameters
  - Configure the DMA Tx or Rx channel
  - Associate the initialized DMA handle to the hi2c DMA Tx or Rx handle
  - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx or Rx channel
3. Configure the Communication Clock Timing, Own Address1, Master Addressing mode, Dual Addressing mode, Own Address2, Own Address2 Mask, General call and Nostretch mode in the hi2c Init structure.
4. Initialize the I2C registers by calling the HAL\_I2C\_Init(), configures also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL\_I2C\_MspInit(&hi2c) API.
5. To check if target device is ready for communication, use the function HAL\_I2C\_IsDeviceReady()
6. For I2C IO and IO MEM operations, three operation modes are available within this driver :

### **Polling mode IO operation**

- Transmit in master mode an amount of data in blocking mode using HAL\_I2C\_Master\_Transmit()
- Receive in master mode an amount of data in blocking mode using HAL\_I2C\_Master\_Receive()
- Transmit in slave mode an amount of data in blocking mode using HAL\_I2C\_Slave\_Transmit()
- Receive in slave mode an amount of data in blocking mode using HAL\_I2C\_Slave\_Receive()

### **Polling mode IO MEM operation**

- Write an amount of data in blocking mode to a specific memory address using HAL\_I2C\_Mem\_Write()
- Read an amount of data in blocking mode from a specific memory address using HAL\_I2C\_Mem\_Read()

### **Interrupt mode IO operation**

- Transmit in master mode an amount of data in non-blocking mode using HAL\_I2C\_Master\_Transmit\_IT()
- At transmission end of transfer, HAL\_I2C\_MasterTxCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MasterTxCallback()
- Receive in master mode an amount of data in non-blocking mode using HAL\_I2C\_Master\_Receive\_IT()

- At reception end of transfer, HAL\_I2C\_MasterRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode using HAL\_I2C\_Slave\_Transmit\_IT()
- At transmission end of transfer, HAL\_I2C\_SlaveTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode using HAL\_I2C\_Slave\_Receive\_IT()
- At reception end of transfer, HAL\_I2C\_SlaveRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_SlaveRxCpltCallback()
- In case of transfer Error, HAL\_I2C\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2C\_ErrorCallback()
- Abort a master I2C process communication with Interrupt using HAL\_I2C\_Master\_Abort\_IT()
- End of abort process, HAL\_I2C\_AbortCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_AbortCpltCallback()
- Discard a slave I2C process communication using \_\_HAL\_I2C\_GENERATE\_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

### Interrupt mode IO sequential operation

These interfaces allow to manage a sequential transfer with a repeated start condition when a direction change during transfer

- A specific option field manage the different steps of a sequential transfer
- Option field values are defined through @ref I2C\_XFEROPTIONS and are listed below:
  - I2C\_FIRST\_AND\_LAST\_FRAME: No sequential usage, functionnal is same as associated interfaces in no sequential mode
  - I2C\_FIRST\_FRAME: Sequential usage, this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition
  - I2C\_FIRST\_AND\_NEXT\_FRAME: Sequential usage (Master only), this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition, an then permit a call the same master sequential interface several times (like HAL\_I2C\_Master\_Sequential\_Transmit\_IT() then HAL\_I2C\_Master\_Sequential\_Transmit\_IT())
  - I2C\_NEXT\_FRAME: Sequential usage, this option allow to manage a sequence with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and without a final stop condition in both cases
  - I2C\_LAST\_FRAME: Sequential usage, this option allow to manage a sequence with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and with a final stop condition in both cases
- Differents sequential I2C interfaces are listed below:
  - Sequential transmit in master I2C mode an amount of data in non-blocking mode using HAL\_I2C\_Master\_Sequential\_Transmit\_IT()

- At transmission end of current frame transfer,  
HAL\_I2C\_MasterTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MasterTxCpltCallback()
- Sequential receive in master I2C mode an amount of data in non-blocking mode using HAL\_I2C\_Master\_Sequential\_Receive\_IT()
- At reception end of current frame transfer,  
HAL\_I2C\_MasterRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MasterRxCpltCallback()
- Abort a master I2C process communication with Interrupt using  
HAL\_I2C\_Master\_Abort\_IT()
  - End of abort process, HAL\_I2C\_AbortCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_AbortCpltCallback()
- Enable/disable the Address listen mode in slave I2C mode using  
HAL\_I2C\_EnableListen\_IT() HAL\_I2C\_DisableListen\_IT()
  - When address slave I2C match, HAL\_I2C\_AddrCallback() is executed and user can add his own code to check the Address Match Code and the transmission direction request by master (Write/Read).
  - At Listen mode end HAL\_I2C\_ListenCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_ListenCpltCallback()
- Sequential transmit in slave I2C mode an amount of data in non-blocking mode using HAL\_I2C\_Slave\_Sequential\_Transmit\_IT()
  - At transmission end of current frame transfer,  
HAL\_I2C\_SlaveTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_SlaveTxCpltCallback()
- Sequential receive in slave I2C mode an amount of data in non-blocking mode using HAL\_I2C\_Slave\_Sequential\_Receive\_IT()
  - At reception end of current frame transfer, HAL\_I2C\_SlaveRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_SlaveRxCpltCallback()
- In case of transfer Error, HAL\_I2C\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2C\_ErrorCallback()
- Abort a master I2C process communication with Interrupt using  
HAL\_I2C\_Master\_Abort\_IT()
  - End of abort process, HAL\_I2C\_AbortCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_AbortCpltCallback()
- Discard a slave I2C process communication using  
\_\_HAL\_I2C\_GENERATE\_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

### Interrupt mode IO MEM operation

- Write an amount of data in non-blocking mode with Interrupt to a specific memory address using HAL\_I2C\_Mem\_Write\_IT()
- At Memory end of write transfer, HAL\_I2C\_MemTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with Interrupt from a specific memory address using HAL\_I2C\_Mem\_Read\_IT()
- At Memory end of read transfer, HAL\_I2C\_MemRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MemRxCpltCallback()

- In case of transfer Error, HAL\_I2C\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2C\_ErrorCallback()

### DMA mode IO operation

- Transmit in master mode an amount of data in non-blocking mode (DMA) using HAL\_I2C\_Master\_Transmit\_DMA()
- At transmission end of transfer, HAL\_I2C\_MasterTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MasterTxCpltCallback()
- Receive in master mode an amount of data in non-blocking mode (DMA) using HAL\_I2C\_Master\_Receive\_DMA()
- At reception end of transfer, HAL\_I2C\_MasterRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode (DMA) using HAL\_I2C\_Slave\_Transmit\_DMA()
- At transmission end of transfer, HAL\_I2C\_SlaveTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode (DMA) using HAL\_I2C\_Slave\_Receive\_DMA()
- At reception end of transfer, HAL\_I2C\_SlaveRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_SlaveRxCpltCallback()
- In case of transfer Error, HAL\_I2C\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2C\_ErrorCallback()
- Abort a master I2C process communication with Interrupt using HAL\_I2C\_Master\_Abort\_IT()
- End of abort process, HAL\_I2C\_AbortCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_AbortCpltCallback()
- Discard a slave I2C process communication using \_\_HAL\_I2C\_GENERATE\_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

### DMA mode IO MEM operation

- Write an amount of data in non-blocking mode with DMA to a specific memory address using HAL\_I2C\_Mem\_Write\_DMA()
- At Memory end of write transfer, HAL\_I2C\_MemTxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with DMA from a specific memory address using HAL\_I2C\_Mem\_Read\_DMA()
- At Memory end of read transfer, HAL\_I2C\_MemRxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_I2C\_MemRxCpltCallback()
- In case of transfer Error, HAL\_I2C\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2C\_ErrorCallback()

### I2C HAL driver macros list

Below the list of most used macros in I2C HAL driver.

- \_\_HAL\_I2C\_ENABLE: Enable the I2C peripheral
- \_\_HAL\_I2C\_DISABLE: Disable the I2C peripheral

- `__HAL_I2C_GENERATE_NACK`: Generate a Non-Acknowledge I2C peripheral in Slave mode
- `__HAL_I2C_GET_FLAG`: Check whether the specified I2C flag is set or not
- `__HAL_I2C_CLEAR_FLAG`: Clear the specified I2C pending flag
- `__HAL_I2C_ENABLE_IT`: Enable the specified I2C interrupt
- `__HAL_I2C_DISABLE_IT`: Disable the specified I2C interrupt

You can refer to the I2C HAL driver header file for more useful macros

## 24.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the I2Cx peripheral:

- User must Implement `HAL_I2C_MspInit()` function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC ).
- Call the function `HAL_I2C_Init()` to configure the selected device with the selected configuration:
  - Clock Timing
  - Own Address 1
  - Addressing mode (Master, Slave)
  - Dual Addressing mode
  - Own Address 2
  - Own Address 2 Mask
  - General call mode
  - Nostretch mode
- Call the function `HAL_I2C_DelInit()` to restore the default configuration of the selected I2Cx peripheral.

This section contains the following APIs:

- [`HAL\_I2C\_Init\(\)`](#)
- [`HAL\_I2C\_DelInit\(\)`](#)
- [`HAL\_I2C\_MspInit\(\)`](#)
- [`HAL\_I2C\_MspDelInit\(\)`](#)

## 24.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the I2C data transfers.

1. There are two modes of transfer:
  - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
  - No-Blocking mode : The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated I2C IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
2. Blocking mode functions are :
  - `HAL_I2C_Master_Transmit()`
  - `HAL_I2C_Master_Receive()`
  - `HAL_I2C_Slave_Transmit()`
  - `HAL_I2C_Slave_Receive()`
  - `HAL_I2C_Mem_Write()`

- HAL\_I2C\_Mem\_Read()
  - HAL\_I2C\_IsDeviceReady()
3. No-Blocking mode functions with Interrupt are :
- HAL\_I2C\_Master\_Transmit\_IT()
  - HAL\_I2C\_Master\_Receive\_IT()
  - HAL\_I2C\_Slave\_Transmit\_IT()
  - HAL\_I2C\_Slave\_Receive\_IT()
  - HAL\_I2C\_Mem\_Write\_IT()
  - HAL\_I2C\_Mem\_Read\_IT()
4. No-Blocking mode functions with DMA are :
- HAL\_I2C\_Master\_Transmit\_DMA()
  - HAL\_I2C\_Master\_Receive\_DMA()
  - HAL\_I2C\_Slave\_Transmit\_DMA()
  - HAL\_I2C\_Slave\_Receive\_DMA()
  - HAL\_I2C\_Mem\_Write\_DMA()
  - HAL\_I2C\_Mem\_Read\_DMA()
5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
- HAL\_I2C\_MemTxCpltCallback()
  - HAL\_I2C\_MemRxCpltCallback()
  - HAL\_I2C\_MasterTxCpltCallback()
  - HAL\_I2C\_MasterRxCpltCallback()
  - HAL\_I2C\_SlaveTxCpltCallback()
  - HAL\_I2C\_SlaveRxCpltCallback()
  - HAL\_I2C\_ErrorCallback()

## 24.2.4 Peripheral State, Mode and Error functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- [\*\*\*HAL\\_I2C\\_GetState\(\)\*\*\*](#)
- [\*\*\*HAL\\_I2C\\_GetMode\(\)\*\*\*](#)
- [\*\*\*HAL\\_I2C\\_GetError\(\)\*\*\*](#)

## 24.2.5 Detailed description of functions

### **HAL\_I2C\_Init**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2C_Init (I2C_HandleTypeDef * hi2c)</b>                                                                                                             |
| Function description | Initializes the I2C according to the specified parameters in the I2C_InitTypeDef and initialize the associated handle.                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2c:</b> Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                       |

### **HAL\_I2C\_DelInit**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2C_DelInit (I2C_HandleTypeDef * hi2c)</b>                                                                                                          |
| Function description | DeInitialize the I2C peripheral.                                                                                                                                             |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2c:</b> Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                       |

### **HAL\_I2C\_MspInit**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_I2C_MspInit (I2C_HandleTypeDef * hi2c)</b>                                                                                                                       |
| Function description | Initialize the I2C MSP.                                                                                                                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2c:</b> Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                              |

### **HAL\_I2C\_MspDelInit**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_I2C_MspDelInit (I2C_HandleTypeDef * hi2c)</b>                                                                                                                    |
| Function description | DeInitialize the I2C MSP.                                                                                                                                                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2c:</b> Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                              |

**HAL\_I2C\_Master\_Transmit**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2C_Master_Transmit<br/>(I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t *<br/>pData, uint16_t Size, uint32_t Timeout)</b>                                                                                                                                                                                                                                                                                                                |
| Function description | Transmits in master mode an amount of data in blocking mode.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2c:</b> Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.</li> <li>• <b>DevAddress:</b> Target device address: The device 7 bits address value in datasheet must be shift at right before call interface</li> <li>• <b>pData:</b> Pointer to data buffer</li> <li>• <b>Size:</b> Amount of data to be sent</li> <li>• <b>Timeout:</b> Timeout duration</li> </ul> |

**HAL\_I2C\_AbortCpltCallback**

Function name      **void HAL\_I2C\_AbortCpltCallback (I2C\_HandleTypeDef \* hi2c)**

Function description      I2C abort callback.

Parameters      

- **hi2c:** Pointer to a I2C\_HandleTypeDef structure that contains the configuration information for the specified I2C.

|               |                                                               |
|---------------|---------------------------------------------------------------|
| Return values | <ul style="list-style-type: none"><li>• <b>None</b></li></ul> |
|---------------|---------------------------------------------------------------|

**HAL\_I2C\_GetState**

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_I2C_StateTypeDef HAL_I2C_GetState<br/>(I2C_HandleTypeDef * hi2c)</b>                                                                                                  |
| Function description | Return the I2C handle state.                                                                                                                                                 |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2c:</b> Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.</li> </ul> |

- I2C\_IT\_RXI RX interrupt enable
- I2C\_IT\_TXI TX interrupt enable

**Return value:**

- None

**\_HAL\_I2C\_GET\_IT\_SOURCE**

- Check whether the specified I2C interrupt source is enabled or not.

**Parameters:**

- \_HANDLE\_: specifies the I2C Handle.
- \_INTERRUPT\_: specifies the I2C interrupt source to check. This parameter can be one of the following values:
  - I2C\_IT\_ERRI Errors interrupt enable
  - I2C\_IT\_TCI Transfer complete interrupt enable
  - I2C\_IT\_STOPI STOP detection interrupt enable
  - I2C\_IT\_NACKI NACK received interrupt enable
  - I2C\_IT\_ADDRI Address match interrupt enable
  - I2C\_IT\_RXI RX interrupt enable
  - I2C\_IT\_TXI TX interrupt enable

**Return value:**

- The new state of \_INTERRUPT\_ (SET or RESET).

**\_HAL\_I2C\_GET\_FLAG**

- Check whether the specified I2C flag is set or not.

**Parameters:**

- \_HANDLE\_: specifies the I2C Handle.
- \_FLAG\_: specifies the flag to check. This parameter can be one of the following values:
  - I2C\_FLAG\_TXE Transmit data register empty
  - I2C\_FLAG\_TXIS Transmit interrupt status
  - I2C\_FLAG\_RXNE Receive data register not empty
  - I2C\_FLAG\_ADDR Address matched (slave mode)
  - I2C\_FLAG\_AF Acknowledge failure received flag
  - I2C\_FLAG\_STOPF STOP detection flag
  - I2C\_FLAG\_TC Transfer complete (master mode)

- I2C\_FLAG\_TCR Transfer complete reload
- I2C\_FLAG\_BERR Bus error
- I2C\_FLAG\_ARLO Arbitration lost
- I2C\_FLAG\_OVR Overrun/Underrun
- I2C\_FLAG\_PECERR PEC error in reception
- I2C\_FLAG\_TIMEOUT Timeout or Tlow detection flag
- I2C\_FLAG\_ALERT SMBus alert
- I2C\_FLAG\_BUSY Bus busy
- I2C\_FLAG\_DIR Transfer direction (slave mode)

**Return value:**

- The new state of \_\_FLAG\_\_ (SET or RESET).

[\\_\\_HAL\\_I2C\\_CLEAR\\_FLAG](#)**Description:**

- Clear the I2C pending flags which are cleared by writing 1 in a specific bit.

**Parameters:**

- \_\_HANDLE\_\_: specifies the I2C Handle.
- \_\_FLAG\_\_: specifies the flag to clear. This parameter can be any combination of the following values:
  - I2C\_FLAG\_TXE Transmit data register empty
  - I2C\_FLAG\_ADDR Address matched (slave mode)
  - I2C\_FLAG\_AF Acknowledge failure received flag
  - I2C\_FLAG\_STOPF STOP detection flag
  - I2C\_FLAG\_BERR Bus error
  - I2C\_FLAG\_ARLO Arbitration lost
  - I2C\_FLAG\_OVR Overrun/Underrun
  - I2C\_FLAG\_PECERR PEC error in reception
  - I2C\_FLAG\_TIMEOUT Timeout or Tlow detection flag
  - I2C\_FLAG\_ALERT SMBus alert

**Return value:**

- None

[\\_\\_HAL\\_I2C\\_ENABLE](#)**Description:**

- Enable the specified I2C peripheral.

**Parameters:**

- \_\_HANDLE\_\_: specifies the I2C Handle.

**Return value:**

- None

`__HAL_I2C_DISABLE`

**Description:**

- Disable the specified I2C peripheral.

**Parameters:**

- `__HANDLE__`: specifies the I2C Handle.

**Return value:**

- None

`__HAL_I2C_GENERATE_NACK`

**Description:**

- Generate a Non-Acknowledge I2C peripheral in Slave mode.

**Parameters:**

- `__HANDLE__`: specifies the I2C Handle.

**Return value:**

- None

## 25 HAL I2C Extension Driver

### 25.1 I2CEEx Firmware driver API description

#### 25.1.1 I2C peripheral Extended features

Comparing to other previous devices, the I2C interface for STM32F3xx devices contains the following additional features

- Possibility to disable or enable Analog Noise Filter
- Use of a configured Digital Noise Filter
- Disable or enable wakeup from Stop mode

#### 25.1.2 How to use this driver

This driver provides functions to configure Noise Filter and Wake Up Feature

1. Configure I2C Analog noise filter using the function `HAL_I2CEEx_ConfigAnalogFilter()`
2. Configure I2C Digital noise filter using the function `HAL_I2CEEx_ConfigDigitalFilter()`
3. Configure the enable or disable of I2C Wake Up Mode using the functions :
  - `HAL_I2CEEx_EnableWakeUp()`
  - `HAL_I2CEEx_DisableWakeUp()`
4. Configure the enable or disable of fast mode plus driving capability using the functions :
  - `HAL_I2CEEx_EnableFastModePlus()`
  - `HAL_I2CEEx_DisableFastModePlus()`

#### 25.1.3 Extended features functions

This section provides functions allowing to:

- Configure Noise Filters
- Configure Wake Up Feature

This section contains the following APIs:

- [`HAL\_I2CEEx\_ConfigAnalogFilter\(\)`](#)
- [`HAL\_I2CEEx\_ConfigDigitalFilter\(\)`](#)
- [`HAL\_I2CEEx\_EnableWakeUp\(\)`](#)
- [`HAL\_I2CEEx\_DisableWakeUp\(\)`](#)
- [`HAL\_I2CEEx\_EnableFastModePlus\(\)`](#)
- [`HAL\_I2CEEx\_DisableFastModePlus\(\)`](#)

#### 25.1.4 Detailed description of functions

##### `HAL_I2CEEx_ConfigAnalogFilter`

Function name      `HAL_StatusTypeDef HAL_I2CEEx_ConfigAnalogFilter(I2C_HandleTypeDef * hi2c, uint32_t AnalogFilter)`

Function description      Configure I2C Analog noise filter.

Parameters     
 

- **hi2c:** Pointer to a I2C\_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **AnalogFilter:** New state of the Analog filter.

## Return values

- **HAL:** status

**HAL\_I2CEEx\_ConfigDigitalFilter**

## Function name

**HAL\_StatusTypeDef HAL\_I2CEEx\_ConfigDigitalFilter  
(I2C\_HandleTypeDef \* hi2c, uint32\_t DigitalFilter)**

## Function description

Configure I2C Digital noise filter.

## Parameters

- **hi2c:** Pointer to a I2C\_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **DigitalFilter:** Coefficient of digital noise filter between Min\_Data=0x00 and Max\_Data=0x0F.

## Return values

- **HAL:** status

**HAL\_I2CEEx\_EnableWakeUp**

## Function name

**HAL\_StatusTypeDef HAL\_I2CEEx\_EnableWakeUp  
(I2C\_HandleTypeDef \* hi2c)**

## Function description

Enable I2C wakeup from stop mode.

## Parameters

- **hi2c:** Pointer to a I2C\_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

## Return values

- **HAL:** status

**HAL\_I2CEEx\_DisableWakeUp**

## Function name

**HAL\_StatusTypeDef HAL\_I2CEEx\_DisableWakeUp  
(I2C\_HandleTypeDef \* hi2c)**

## Function description

Disable I2C wakeup from stop mode.

## Parameters

- **hi2c:** Pointer to a I2C\_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

## Return values

- **HAL:** status

**HAL\_I2CEEx\_EnableFastModePlus**

## Function name

**void HAL\_I2CEEx\_EnableFastModePlus (uint32\_t  
ConfigFastModePlus)**

## Function description

Enable the I2C fast mode plus driving capability.

## Parameters

- **ConfigFastModePlus:** Selects the pin. This parameter can be one of the I2C Extended Fast Mode Plus values

## Return values

- **None**

## Notes

- For I2C1, fast mode plus driving capability can be enabled on all selected I2C1 pins using I2C\_FASTMODEPLUS\_I2C1 parameter or independently on each one of the following pins PB6, PB7, PB8 and PB9.
- For remaining I2C1 pins (PA14, PA15...) fast mode plus driving capability can be enabled only by using I2C\_FASTMODEPLUS\_I2C1 parameter.
- For all I2C2 pins fast mode plus driving capability can be

- enabled only by using I2C\_FASTMODEPLUS\_I2C2 parameter.
- For all I2C3 pins fast mode plus driving capability can be enabled only by using I2C\_FASTMODEPLUS\_I2C3 parameter.

## 26.2 I2S Firmware driver API description

### 26.2.1 How to use this driver

The I2S HAL driver can be used as follows:

1. Declare a I2S\_HandleTypeDef handle structure.
2. Initialize the I2S low level resources by implement the HAL\_I2S\_MspInit() API:
  - a. Enable the SPIx interface clock.
  - b. I2S pins configuration:
    - Enable the clock for the I2S GPIOs.
    - Configure these I2S pins as alternate function pull-up.
  - c. NVIC configuration if you need to use interrupt process (HAL\_I2S\_Transmit\_IT() and HAL\_I2S\_Receive\_IT() APIs).
    - Configure the I2Sx interrupt priority.
    - Enable the NVIC I2S IRQ handle.
  - d. DMA Configuration if you need to use DMA process (HAL\_I2S\_Transmit\_DMA() and HAL\_I2S\_Receive\_DMA() APIs):
    - Declare a DMA handle structure for the Tx/Rx channel.

- Enable the DMAx interface clock.
  - Configure the declared DMA handle structure with the required Tx/Rx parameters.
  - Configure the DMA Tx/Rx Channel.
  - Associate the initialized DMA handle to the I2S DMA Tx/Rx handle.
  - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx Channel.
3. Program the Mode, Standard, Data Format, MCLK Output, Audio frequency and Polarity using HAL\_I2S\_Init() function. The specific I2S interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros \_\_HAL\_I2S\_ENABLE\_IT() and \_\_HAL\_I2S\_DISABLE\_IT() inside the transmit and receive process. Make sure that either: I2S clock is configured based on SYSCLK or External clock source is configured after setting correctly the define constant EXTERNAL\_CLOCK\_VALUE in the stm32f3xx\_hal\_conf.h file.
4. Three mode of operations are available within this driver :

### Polling mode IO operation

- Send an amount of data in blocking mode using HAL\_I2S\_Transmit()
- Receive an amount of data in blocking mode using HAL\_I2S\_Receive()

### Interrupt mode IO operation

- Send an amount of data in non blocking mode using HAL\_I2S\_Transmit\_IT()
- At transmission end of half transfer HAL\_I2S\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxHalfCpltCallback
- At transmission end of transfer HAL\_I2S\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxCpltCallback
- Receive an amount of data in non blocking mode using HAL\_I2S\_Receive\_IT()
- At reception end of half transfer HAL\_I2S\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxHalfCpltCallback
- At reception end of transfer HAL\_I2S\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxCpltCallback
- In case of transfer Error, HAL\_I2S\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2S\_ErrorCallback

### DMA mode IO operation

- Send an amount of data in non blocking mode (DMA) using HAL\_I2S\_Transmit\_DMA()
- At transmission end of half transfer HAL\_I2S\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxHalfCpltCallback
- At transmission end of transfer HAL\_I2S\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxCpltCallback
- Receive an amount of data in non blocking mode (DMA) using HAL\_I2S\_Receive\_DMA()
- At reception end of half transfer HAL\_I2S\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxHalfCpltCallback
- At reception end of transfer HAL\_I2S\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxCpltCallback

- In case of transfer Error, HAL\_I2S\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2S\_ErrorCallback
- Pause the DMA Transfer using HAL\_I2S\_DMAPause()
- Resume the DMA Transfer using HAL\_I2S\_DMAResume()
- Stop the DMA Transfer using HAL\_I2S\_DMAStop()

### I2S HAL driver macros list

Below the list of most used macros in I2S HAL driver.

- \_\_HAL\_I2S\_ENABLE: Enable the specified SPI peripheral (in I2S mode)
- \_\_HAL\_I2S\_DISABLE: Disable the specified SPI peripheral (in I2S mode)
- \_\_HAL\_I2S\_ENABLE\_IT : Enable the specified I2S interrupts
- \_\_HAL\_I2S\_DISABLE\_IT : Disable the specified I2S interrupts
- \_\_HAL\_I2S\_GET\_FLAG: Check whether the specified I2S flag is set or not

You can refer to the I2S HAL driver header file for more useful macros

### 26.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and de-initialize the I2Sx peripheral in simplex mode:

- User must Implement HAL\_I2S\_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC ).
- Call the function HAL\_I2S\_Init() to configure the selected device with the selected configuration:
  - Mode
  - Standard
  - Data Format
  - MCLK Output
  - Audio frequency
  - Polarity
  - Full duplex mode
- Call the function HAL\_I2S\_DeInit() to restore the default configuration of the selected I2Sx peripheral.

This section contains the following APIs:

- [\*\*HAL\\_I2S\\_Init\(\)\*\*](#)
- [\*\*HAL\\_I2S\\_DeInit\(\)\*\*](#)
- [\*\*HAL\\_I2S\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_I2S\\_MspDeInit\(\)\*\*](#)

### 26.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the I2S data transfers.

1. There are two modes of transfer:
  - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
  - No-Blocking mode : The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data

processing will be indicated through the dedicated I2S IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.

2. Blocking mode functions are :
  - HAL\_I2S\_Transmit()
  - HAL\_I2S\_Receive()
3. No-Blocking mode functions with Interrupt are :
  - HAL\_I2S\_Transmit\_IT()
  - HAL\_I2S\_Receive\_IT()
4. No-Blocking mode functions with DMA are :
  - HAL\_I2S\_Transmit\_DMA()
  - HAL\_I2S\_Receive\_DMA()
5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
  - HAL\_I2S\_TxCpltCallback()
  - HAL\_I2S\_RxCpltCallback()
  - HAL\_I2S\_ErrorCallback()

This section contains the following APIs:

- [\*HAL\\_I2S\\_Transmit\(\)\*](#)
- [\*HAL\\_I2S\\_Receive\(\)\*](#)
- [\*HAL\\_I2S\\_Transmit\\_IT\(\)\*](#)
- [\*HAL\\_I2S\\_Receive\\_IT\(\)\*](#)
- [\*HAL\\_I2S\\_Transmit\\_DMA\(\)\*](#)
- [\*HAL\\_I2S\\_Receive\\_DMA\(\)\*](#)
- [\*HAL\\_I2S\\_DMAPause\(\)\*](#)
- [\*HAL\\_I2S\\_DMAResume\(\)\*](#)
- [\*HAL\\_I2S\\_DMAStop\(\)\*](#)
- [\*HAL\\_I2S\\_IRQHandler\(\)\*](#)
- [\*HAL\\_I2S\\_TxHalfCpltCallback\(\)\*](#)
- [\*HAL\\_I2S\\_TxCpltCallback\(\)\*](#)
- [\*HAL\\_I2S\\_RxHalfCpltCallback\(\)\*](#)
- [\*HAL\\_I2S\\_RxCpltCallback\(\)\*](#)
- [\*HAL\\_I2S\\_ErrorCallback\(\)\*](#)
- [\*HAL\\_I2S\\_FullIDuplex\\_IRQHandler\(\)\*](#)
- [\*HAL\\_I2S\\_TxRxCpltCallback\(\)\*](#)
- [\*HAL\\_I2S\\_TxRxHalfCpltCallback\(\)\*](#)

#### 26.2.4 Peripheral State and Errors functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- [\*HAL\\_I2S\\_GetState\(\)\*](#)
- [\*HAL\\_I2S\\_GetError\(\)\*](#)
- [\*HAL\\_I2S\\_DMAPause\(\)\*](#)
- [\*HAL\\_I2S\\_DMAResume\(\)\*](#)
- [\*HAL\\_I2S\\_DMAStop\(\)\*](#)

## 26.2.5 Detailed description of functions

### **HAL\_I2S\_Init**

### **HAL\_I2S\_Transmit**

|                      |                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2S_Transmit (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size, uint32_t Timeout)</b>                                              |
| Function description | Transmit an amount of data in blocking mode.                                                                                                                         |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2s:</b> pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module</li> </ul> |

- **pData:** a 16-bit pointer to data buffer.
  - **Size:** number of data sample to be sent:
  - **Timeout:** Timeout duration
  - **HAL:** status
- Return values**
- Notes**
- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
  - The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

### HAL\_I2S\_Receive

- Function name** `HAL_StatusTypeDef HAL_I2S_Receive (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size, uint32_t Timeout)`
- Function description** Receive an amount of data in blocking mode.
- Parameters**
- **hi2s:** pointer to a I2S\_HandleTypeDef structure that contains the configuration information for I2S module
  - **pData:** a 16-bit pointer to data buffer.
  - **Size:** number of data sample to be sent:
  - **Timeout:** Timeout duration
- Return values**
- Notes**
- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
  - The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).
  - In I2S Master Receiver mode, just after enabling the peripheral the clock will be generate in continouse way and as the I2S is not disabled at the end of the I2S transaction.

### HAL\_I2S\_Transmit\_IT

- Function name** `HAL_StatusTypeDef HAL_I2S_Transmit_IT (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size)`
- Function description** Transmit an amount of data in non-blocking mode with Interrupt.
- Parameters**
- **hi2s:** pointer to a I2S\_HandleTypeDef structure that contains the configuration information for I2S module
  - **pData:** a 16-bit pointer to data buffer.
  - **Size:** number of data sample to be sent:
- Return values**
- **HAL:** status

\_\_HAL\_I2S\_RESET\_HANDLE\_STATE      **Description:**

- Reset I2S handle state.

**Parameters:**

- \_\_HANDLE\_\_: I2S handle.

**Return value:**

- None

**Description:**

- Enable or disable the specified SPI peripheral (in I2S mode).

**Parameters:**

- \_\_HANDLE\_\_: specifies the I2S Handle.

**Return value:**

- None

\_\_HAL\_I2S\_DISABLE

\_\_HAL\_I2S\_ENABLE\_IT

**Description:**

- Enable or disable the specified I2S interrupts.

**Parameters:**

- HANDLE: specifies the I2S Handle.
- INTERRUPT: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - I2S\_IT\_TXE: Tx buffer empty interrupt enable
  - I2S\_IT\_RXNE: RX buffer not empty interrupt enable
  - I2S\_IT\_ERR: Error interrupt enable

**Return value:**

- None

\_HAL\_I2S\_DISABLE\_IT  
\_HAL\_I2S\_GET\_IT\_SOURCE

**Description:**

- Checks if the specified I2S interrupt source is enabled or disabled.

**Parameters:**

- HANDLE: specifies the I2S Handle. This parameter can be I2S where x: 1, 2, or 3 to select the I2S peripheral.
- INTERRUPT: specifies the I2S interrupt source to check. This parameter can be one of the following values:
  - I2S\_IT\_TXE: Tx buffer empty interrupt enable
  - I2S\_IT\_RXNE: RX buffer not empty interrupt enable
  - I2S\_IT\_ERR: Error interrupt enable

**Return value:**

- The: new state of IT (TRUE or FALSE).

\_HAL\_I2S\_GET\_FLAG

**Description:**

- Checks whether the specified I2S flag is set or not.

**Parameters:**

- HANDLE: specifies the I2S Handle.
- FLAG: specifies the flag to check. This parameter can be one of the following values:
  - I2S\_FLAG\_RXNE: Receive buffer not empty flag
  - I2S\_FLAG\_TXE: Transmit buffer empty flag
  - I2S\_FLAG\_UDR: Underrun flag
  - I2S\_FLAG\_OVR: Overrun flag
  - I2S\_FLAG\_FRE: Frame error flag
  - I2S\_FLAG\_CHSIDE: Channel Side flag

- I2S\_FLAG\_BSY: Busy flag

**Return value:**

- The: new state of \_\_FLAG\_\_ (TRUE or FALSE).

`_HAL_I2S_CLEAR_OVRFLAG`

**Description:**

- Clears the I2S OVR pending flag.

**Parameters:**

- `_HANDLE_`: specifies the I2S Handle.

**Return value:**

- None

`_HAL_I2S_CLEAR_UDRFLAG`

**Description:**

- Clears the I2S UDR pending flag.

**Parameters:**

- `_HANDLE_`: specifies the I2S Handle.

**Return value:**

- None

## 27 HAL I2S Extension Driver

### 27.1 I2SEEx Firmware driver API description

#### 27.1.1 I2S Extended features

1. In I2S full duplex mode, each SPI peripheral is able to manage sending and receiving data simultaneously using two data lines. Each SPI peripheral has an extended block called I2Sxext ie. I2S2ext for SPI2 and I2S3ext for SPI3).
2. The Extended block is not a full SPI IP, it is used only as I2S slave to implement full duplex mode. The Extended block uses the same clock sources as its master.
3. Both I2Sx and I2Sx\_ext can be configured as transmitters or receivers. Only I2Sx can deliver SCK and WS to I2Sx\_ext in full duplex mode, where I2Sx can be I2S2 or I2S3.

#### 27.1.2 How to use this driver

Three mode of operations are available within this driver :

##### **Polling mode IO operation**

- Send and receive in the same time an amount of data in blocking mode using HAL\_I2S\_TransmitReceive()

##### **Interrupt mode IO operation**

- Send and receive in the same time an amount of data in non blocking mode using HAL\_I2S\_TransmitReceive\_IT()
- At transmission end of half transfer HAL\_I2S\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxHalfCpltCallback
- At transmission end of transfer HAL\_I2S\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxCpltCallback
- At reception end of half transfer HAL\_I2S\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxHalfCpltCallback
- At reception end of transfer HAL\_I2S\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxCpltCallback
- In case of transfer Error, HAL\_I2S\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2S\_ErrorCallback

##### **DMA mode IO operation**

- Send and receive an amount of data in non blocking mode (DMA) using HAL\_I2S\_TransmitReceive\_DMA()
- At transmission end of half transfer HAL\_I2S\_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxHalfCpltCallback
- At transmission end of transfer HAL\_I2S\_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_TxCpltCallback
- At reception end of half transfer HAL\_I2S\_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxHalfCpltCallback

- At reception end of transfer HAL\_I2S\_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL\_I2S\_RxCpltCallback
- In case of transfer Error, HAL\_I2S\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_I2S\_ErrorCallback
- Pause the DMA Transfer using HAL\_I2S\_DMAPause()
- Resume the DMA Transfer using HAL\_I2S\_DMAResume()
- Stop the DMA Transfer using HAL\_I2S\_DMAStop()

### 27.1.3 Extended features Functions

This subsection provides a set of functions allowing to manage the I2S data transfers.

1. There are two mode of transfer:
  - Blocking mode: The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
  - No-Blocking mode: The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated I2S IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
2. Blocking mode functions are :
  - HAL\_I2S\_TransmitReceive()
3. No-Blocking mode functions with Interrupt are:
  - HAL\_I2S\_TransmitReceive\_IT()
  - HAL\_I2SFULLDuplex\_IRQHandler()
4. No-Blocking mode functions with DMA are:
  - HAL\_I2S\_TransmitReceive\_DMA()
5. A set of Transfer Complete Callbacks are provided in No\_Blocking mode:
  - HAL\_I2S\_TxRxCpltCallback()
  - HAL\_I2S\_TxRxHalfCpltCallback()
  - HAL\_I2S\_TxRxErrorCallback()

This section contains the following APIs:

- [\*\*\*HAL\\_I2SEEx\\_TransmitReceive\(\)\*\*\*](#)
- [\*\*\*HAL\\_I2SEEx\\_TransmitReceive\\_IT\(\)\*\*\*](#)
- [\*\*\*HAL\\_I2SEEx\\_TransmitReceive\\_DMA\(\)\*\*\*](#)

### 27.1.4 Detailed description of functions

#### HAL\_I2SEEx\_TransmitReceive

|                      |                                                                                                                                                                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2SEEx_TransmitReceive<br/>(I2S_HandleTypeDef * hi2s, uint16_t * pTxData, uint16_t *<br/>pRxData, uint16_t Size, uint32_t Timeout)</b>                                                                                                                                                                    |
| Function description | Full-Duplex Transmit/Receive data in blocking mode.                                                                                                                                                                                                                                                                                |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hi2s:</b> I2S handle</li> <li>• <b>pTxData:</b> a 16-bit pointer to the Transmit data buffer.</li> <li>• <b>pRxData:</b> a 16-bit pointer to the Receive data buffer.</li> <li>• <b>Size:</b> number of data sample to be sent:</li> <li>• <b>Timeout:</b> Timeout duration</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                             |
| Notes                | <ul style="list-style-type: none"> <li>• When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the <b>Size</b> parameter means the number of 16-bit data length in the</li> </ul>                                                                                               |

transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.

- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

### **HAL\_I2SEEx\_TransmitReceive\_IT**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2SEEx_TransmitReceive_IT<br/>(I2S_HandleTypeDef * hi2s, uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)</b>                                                                                                                                                                                                                                                                                                                                                                            |
| Function description | Full-Duplex Transmit/Receive data in non-blocking mode using Interrupt.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Parameters           | <ul style="list-style-type: none"> <li><b>hi2s:</b> I2S handle</li> <li><b>pTxData:</b> a 16-bit pointer to the Transmit data buffer.</li> <li><b>pRxData:</b> a 16-bit pointer to the Receive data buffer.</li> <li><b>Size:</b> number of data sample to be sent:</li> </ul>                                                                                                                                                                                                                                          |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Notes                | <ul style="list-style-type: none"> <li>When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.</li> <li>The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).</li> </ul> |

### **HAL\_I2SEEx\_TransmitReceive\_DMA**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2SEEx_TransmitReceive_DMA<br/>(I2S_HandleTypeDef * hi2s, uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)</b>                                                                                                                                                                                                                                                                                                                                                                           |
| Function description | Full-Duplex Transmit/Receive data in non-blocking mode using DMA.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Parameters           | <ul style="list-style-type: none"> <li><b>hi2s:</b> I2S handle</li> <li><b>pTxData:</b> a 16-bit pointer to the Transmit data buffer.</li> <li><b>pRxData:</b> a 16-bit pointer to the Receive data buffer.</li> <li><b>Size:</b> number of data sample to be sent:</li> </ul>                                                                                                                                                                                                                                          |

**HAL\_I2S\_FullDuplex\_IRQHandler**

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>void HAL_I2S_FullDuplex_IRQHandler (I2S_HandleTypeDef * hi2s)</b>      |
| Function description | This function handles I2S/I2Sext interrupt requests in full-duplex mode.  |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hi2s:</b> I2S handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>      |

**HAL\_I2S\_TxRxCpltCallback**

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>void HAL_I2S_TxRxCpltCallback (I2S_HandleTypeDef * hi2s)</b>           |
| Function description | Tx and Rx Transfer completed callbacks.                                   |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hi2s:</b> I2S handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>             |

**HAL\_I2S\_TxRxHalfCpltCallback**

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>void HAL_I2S_TxRxHalfCpltCallback (I2S_HandleTypeDef * hi2s)</b>       |
| Function description | Tx and Rx Transfer half completed callbacks.                              |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hi2s:</b> I2S handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>             |

**HAL\_I2S\_DMAPause**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2S_DMAPause (I2S_HandleTypeDef * hi2s)</b>        |
| Function description | Pauses the audio stream playing from the Media.                             |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hi2s:</b> : I2S handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>               |

**HAL\_I2S\_DMAResume**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_I2S_DMAResume (I2S_HandleTypeDef * hi2s)</b>       |
| Function description | Resumes the audio stream playing from the Media.                            |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hi2s:</b> : I2S handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>               |

**HAL\_I2S\_DMAStop**

## 27.2 I2SEEx Firmware driver defines

### 27.2.1 I2SEEx

#### *I2S Extended Exported Macros*

##### I2SxEXT

`_HAL_I2SEXT_ENABLE`

##### Description:

- Enable or disable the specified I2SExt peripheral.

##### Parameters:

- `_HANDLE_`: specifies the I2S Handle.

##### Return value:

- None

`_HAL_I2SEXT_DISABLE`

`_HAL_I2SEXT_ENABLE_IT`

##### Description:

- Enable or disable the specified I2SExt interrupts.

##### Parameters:

- `_HANDLE_`: specifies the I2S Handle.
- `_INTERRUPT_`: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - `I2S_IT_TXE`: Tx buffer empty interrupt enable
  - `I2S_IT_RXNE`: RX buffer not empty interrupt enable
  - `I2S_IT_ERR`: Error interrupt enable

##### Return value:

- None

`_HAL_I2SEXT_DISABLE_IT`

`_HAL_I2SEXT_GET_IT_SOURCE`

##### Description:

- Checks if the specified I2SExt interrupt source is enabled or disabled.

##### Parameters:

- `_HANDLE_`: specifies the I2S Handle. This parameter can be I2S where x: 1, 2, or 3 to select the I2S peripheral.
- `_INTERRUPT_`: specifies the I2S interrupt source to check. This parameter can be one of the following values:
  - `I2S_IT_TXE`: Tx buffer empty interrupt

- enable
  - I2S\_IT\_RXNE: RX buffer not empty interrupt enable
  - I2S\_IT\_ERR: Error interrupt enable

**Return value:**

- The: new state of \_\_IT\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_I2SEXT\\_GET\\_FLAG](#)

**Description:**

- Checks whether the specified I2SExt flag is set or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the I2S Handle.
- \_\_FLAG\_\_: specifies the flag to check. This parameter can be one of the following values:
  - I2S\_FLAG\_RXNE: Receive buffer not empty flag
  - I2S\_FLAG\_TXE: Transmit buffer empty flag
  - I2S\_FLAG\_UDR: Underrun flag
  - I2S\_FLAG\_OVR: Overrun flag
  - I2S\_FLAG\_FRE: Frame error flag
  - I2S\_FLAG\_CHSIDE: Channel Side flag
  - I2S\_FLAG\_BSY: Busy flag

**Return value:**

- The: new state of \_\_FLAG\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_I2SEXT\\_CLEAR\\_OVRFLAG](#)

**Description:**

- Clears the I2SExt OVR pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the I2S Handle.

**Return value:**

- None

[\\_\\_HAL\\_I2SEXT\\_CLEAR\\_UDRFLAG](#)

**Description:**

- Clears the I2SExt UDR pending flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the I2S Handle.

**Return value:**

- None

## 28 HAL IRDA Generic Driver

### 28.1 IRDA Firmware driver registers structures

#### 28.1.1 IRDA\_InitTypeDef

##### Data Fields

- *uint32\_t BaudRate*
- *uint32\_t WordLength*
- *uint32\_t Parity*
- *uint32\_t Mode*
- *uint8\_t Prescaler*
- *uint16\_t PowerMode*

##### Field Documentation

- ***uint32\_t IRDA\_InitTypeDef::BaudRate***

This member configures the IRDA communication baud rate. The baud rate register is computed using the following formula: Baud Rate Register = ((PCLKx) / ((hirda->Init.BaudRate)))

- ***uint32\_t IRDA\_InitTypeDef::WordLength***

Specifies the number of data bits transmitted or received in a frame. This parameter can be a value of [IRDAEx\\_Word\\_Length](#)

- ***uint32\_t IRDA\_InitTypeDef::Parity***

Specifies the parity mode. This parameter can be a value of [IRDA\\_Parity](#)  
**Note:**When parity is enabled, the computed parity is inserted at the MSB position of the transmitted data (9th bit when the word length is set to 9 data bits; 8th bit when the word length is set to 8 data bits).

- ***uint32\_t IRDA\_InitTypeDef::Mode***

Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of [IRDA\\_Transfer\\_Mode](#)

- ***uint8\_t IRDA\_InitTypeDef::Prescaler***

Specifies the Prescaler value for dividing the UART/USART source clock to achieve low-power frequency.

**Note:**Prescaler value 0 is forbidden

- ***uint16\_t IRDA\_InitTypeDef::PowerMode***

Specifies the IRDA power mode. This parameter can be a value of [IRDA\\_Low\\_Power](#)

#### 28.1.2 IRDA\_HandleTypeDef

##### Data Fields

- *USART\_TypeDef \* Instance*
- *IRDA\_InitTypeDef Init*
- *uint8\_t \* pTxBuffPtr*
- *uint16\_t TxXferSize*
- *\_\_IO uint16\_t TxXferCount*
- *uint8\_t \* pRxBuffPtr*
- *uint16\_t RxXferSize*
- *\_\_IO uint16\_t RxXferCount*
- *uint16\_t Mask*
- *DMA\_HandleTypeDef \* hdmatx*
- *DMA\_HandleTypeDef \* hdmarx*

- ***HAL\_LockTypeDef Lock***
- ***\_IO HAL\_IRDA\_StateTypeDef gState***
- ***\_IO HAL\_IRDA\_StateTypeDef RxState***
- ***\_IO uint32\_t ErrorCode***

#### Field Documentation

- ***USART\_TypeDef\* IRDA\_HandleTypeDef::Instance***  
IRDA registers base address
- ***IRDA\_InitTypeDef IRDA\_HandleTypeDef::Init***  
IRDA communication parameters
- ***uint8\_t\* IRDA\_HandleTypeDef::pTxBuffPtr***  
Pointer to IRDA Tx transfer Buffer
- ***uint16\_t IRDA\_HandleTypeDef::TxXferSize***  
IRDA Tx Transfer size
- ***\_IO uint16\_t IRDA\_HandleTypeDef::TxXferCount***  
IRDA Tx Transfer Counter
- ***uint8\_t\* IRDA\_HandleTypeDef::pRxBuffPtr***  
Pointer to IRDA Rx transfer Buffer
- ***uint16\_t IRDA\_HandleTypeDef::RxXferSize***  
IRDA Rx Transfer size
- ***\_IO uint16\_t IRDA\_HandleTypeDef::RxXferCount***  
IRDA Rx Transfer Counter
- ***uint16\_t IRDA\_HandleTypeDef::Mask***  
IRDA RX RDR register mask
- ***DMA\_HandleTypeDef\* IRDA\_HandleTypeDef::hdmatx***  
IRDA Tx DMA Handle parameters
- ***DMA\_HandleTypeDef\* IRDA\_HandleTypeDef::hdmarx***  
IRDA Rx DMA Handle parameters
- ***HAL\_LockTypeDef IRDA\_HandleTypeDef::Lock***  
Locking object
- ***\_IO HAL\_IRDA\_StateTypeDef IRDA\_HandleTypeDef::gState***  
IRDA state information related to global Handle management and also related to Tx operations. This parameter can be a value of **HAL\_IRDA\_StateTypeDef**
- ***\_IO HAL\_IRDA\_StateTypeDef IRDA\_HandleTypeDef::RxState***  
IRDA state information related to Rx operations. This parameter can be a value of **HAL\_IRDA\_StateTypeDef**
- ***\_IO uint32\_t IRDA\_HandleTypeDef::ErrorCode***  
IRDA Error code This parameter can be a value of **IRDA\_Error**

## 28.2 IRDA Firmware driver API description

### 28.2.1 How to use this driver

The IRDA HAL driver can be used as follows:

1. Declare a IRDA\_HandleTypeDef handle structure (eg. IRDA\_HandleTypeDef hirda).
2. Initialize the IRDA low level resources by implementing the HAL\_IRDA\_MspInit() API in setting the associated USART or UART in IRDA mode:
  - Enable the USARTx/UARTx interface clock.
  - USARTx/UARTx pins configuration:
    - Enable the clock for the USARTx/UARTx GPIOs.
    - Configure these USARTx/UARTx pins (TX as alternate function pull-up, RX as alternate function Input).

- NVIC configuration if you need to use interrupt process (HAL\_IRDA\_Transmit\_IT() and HAL\_IRDA\_Receive\_IT() APIs):
    - Configure the USARTx/UARTx interrupt priority.
    - Enable the NVIC USARTx/UARTx IRQ handle.
    - The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros \_\_HAL\_IRDA\_ENABLE\_IT() and \_\_HAL\_IRDA\_DISABLE\_IT() inside the transmit and receive process.
  - DMA Configuration if you need to use DMA process (HAL\_IRDA\_Transmit\_DMA() and HAL\_IRDA\_Receive\_DMA() APIs):
    - Declare a DMA handle structure for the Tx/Rx channel.
    - Enable the DMAx interface clock.
    - Configure the declared DMA handle structure with the required Tx/Rx parameters.
    - Configure the DMA Tx/Rx channel.
    - Associate the initialized DMA handle to the IRDA DMA Tx/Rx handle.
    - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
3. Program the Baud Rate, Word Length and Parity and Mode(Receiver/Transmitter), the normal or low power mode and the clock prescaler in the hirda handle Init structure.
  4. Initialize the IRDA registers by calling the HAL\_IRDA\_Init() API:
    - This API configures also the low level Hardware (GPIO, CLOCK, CORTEX...etc) by calling the customized HAL\_IRDA\_MspInit() API. The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros \_\_HAL\_IRDA\_ENABLE\_IT() and \_\_HAL\_IRDA\_DISABLE\_IT() inside the transmit and receive process.
  5. Three operation modes are available within this driver :

### **Polling mode IO operation**

- Send an amount of data in blocking mode using HAL\_IRDA\_Transmit()
- Receive an amount of data in blocking mode using HAL\_IRDA\_Receive()

### **Interrupt mode IO operation**

- Send an amount of data in non-blocking mode using HAL\_IRDA\_Transmit\_IT()
- At transmission end of transfer HAL\_IRDA\_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_IRDA\_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL\_IRDA\_Receive\_IT()
- At reception end of transfer HAL\_IRDA\_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_IRDA\_RxCpltCallback()
- In case of transfer Error, HAL\_IRDA\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_IRDA\_ErrorCallback()

### **DMA mode IO operation**

- Send an amount of data in non-blocking mode (DMA) using HAL\_IRDA\_Transmit\_DMA()
- At transmission half of transfer HAL\_IRDA\_TxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_IRDA\_TxHalfCpltCallback()
- At transmission end of transfer HAL\_IRDA\_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_IRDA\_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL\_IRDA\_Receive\_DMA()

- At reception half of transfer HAL\_IRDA\_RxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_IRDA\_RxHalfCpltCallback()
- At reception end of transfer HAL\_IRDA\_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL\_IRDA\_RxCpltCallback()
- In case of transfer Error, HAL\_IRDA\_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL\_IRDA\_ErrorCallback()

### IRDA HAL driver macros list

Below the list of most used macros in IRDA HAL driver.

- \_\_HAL\_IRDA\_ENABLE: Enable the IRDA peripheral
- \_\_HAL\_IRDA\_DISABLE: Disable the IRDA peripheral
- \_\_HAL\_IRDA\_GET\_FLAG : Check whether the specified IRDA flag is set or not
- \_\_HAL\_IRDA\_CLEAR\_FLAG : Clear the specified IRDA pending flag
- \_\_HAL\_IRDA\_ENABLE\_IT: Enable the specified IRDA interrupt
- \_\_HAL\_IRDA\_DISABLE\_IT: Disable the specified IRDA interrupt
- \_\_HAL\_IRDA\_GET\_IT\_SOURCE: Check whether or not the specified IRDA interrupt is enabled

You can refer to the IRDA HAL driver header file for more useful macros

### 28.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USARTx in asynchronous IRDA mode.

- For the asynchronous mode only these parameters can be configured:
  - Baud Rate
  - Word Length
  - Parity
  - Power mode
  - Prescaler setting
  - Receiver/transmitter modes

The HAL\_IRDA\_Init() API follows the USART asynchronous configuration procedures (details for the procedures are available in reference manual).

This section contains the following APIs:

- [\*\*HAL\\_IRDA\\_Init\(\)\*\*](#)
- [\*\*HAL\\_IRDA\\_DeInit\(\)\*\*](#)
- [\*\*HAL\\_IRDA\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_IRDA\\_MspDeInit\(\)\*\*](#)

### 28.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the IRDA data transfers.

IrDA is a half duplex communication protocol. If the Transmitter is busy, any data on the IrDA receive line will be ignored by the IrDA decoder and if the Receiver is busy, data on the TX from the USART to IrDA will not be encoded by IrDA. While receiving data, transmission should be avoided as the data to be transmitted could be corrupted.

1. There are two mode of transfer:
  - Blocking mode: the communication is performed in polling mode. The HAL status of all data processing is returned by the same function after finishing transfer.
  - Non-Blocking mode: the communication is performed using Interrupts or DMA, these API's return the HAL status. The end of the data processing will be indicated through the dedicated IRDA IRQ when using Interrupt mode or the DMA IRQ when using DMA mode. The HAL\_IRDA\_TxCpltCallback(), HAL\_IRDA\_RxCpltCallback() user callbacks will be executed respectively at the end of the Transmit or Receive process. The HAL\_IRDA\_ErrorCallback() user callback will be executed when a communication error is detected
2. Blocking mode APIs are :
  - HAL\_IRDA\_Transmit()
  - HAL\_IRDA\_Receive()
3. Non Blocking mode APIs with Interrupt are :
  - HAL\_IRDA\_Transmit\_IT()
  - HAL\_IRDA\_Receive\_IT()
  - HAL\_IRDA\_IRQHandler()
4. Non Blocking mode functions with DMA are :
  - HAL\_IRDA\_Transmit\_DMA()
  - HAL\_IRDA\_Receive\_DMA()
  - HAL\_IRDA\_DMAPause()
  - HAL\_IRDA\_DMAResume()
  - HAL\_IRDA\_DMAStop()
5. A set of Transfer Complete Callbacks are provided in Non Blocking mode:
  - HAL\_IRDA\_TxHalfCpltCallback()
  - HAL\_IRDA\_TxCpltCallback()
  - HAL\_IRDA\_RxHalfCpltCallback()
  - HAL\_IRDA\_RxCpltCallback()
  - HAL\_IRDA\_ErrorCallback()
6. Non-Blocking mode transfers could be aborted using Abort API's :
  - HAL\_IRDA\_Abort()
  - HAL\_IRDA\_AbortTransmit()
  - HAL\_IRDA\_AbortReceive()
  - HAL\_IRDA\_Abort\_IT()
  - HAL\_IRDA\_AbortTransmit\_IT()
  - HAL\_IRDA\_AbortReceive\_IT()
7. For Abort services based on interrupts (HAL\_IRDA\_Abortxxx\_IT), a set of Abort Complete Callbacks are provided:
  - HAL\_IRDA\_AbortCpltCallback()
  - HAL\_IRDA\_AbortTransmitCpltCallback()
  - HAL\_IRDA\_AbortReceiveCpltCallback()
8. In Non-Blocking mode transfers, possible errors are split into 2 categories. Errors are handled as follows :
  - Error is considered as Recoverable and non blocking : Transfer could go till end, but error severity is to be evaluated by user : this concerns Frame Error, Parity Error or Noise Error in Interrupt mode reception . Received character is then retrieved and stored in Rx buffer, Error code is set to allow user to identify error type, and HAL\_IRDA\_ErrorCallback() user callback is executed. Transfer is kept ongoing on IRDA side. If user wants to abort it, Abort services should be called by user.
  - Error is considered as Blocking : Transfer could not be completed properly and is aborted. This concerns Overrun Error In Interrupt mode reception and all errors in DMA mode. Error code is set to allow user to identify error type, and HAL\_IRDA\_ErrorCallback() user callback is executed.

This section contains the following APIs:

- [\*HAL\\_IRDA\\_Transmit\(\)\*](#)
- [\*HAL\\_IRDA\\_Receive\(\)\*](#)
- [\*HAL\\_IRDA\\_Transmit\\_IT\(\)\*](#)
- [\*HAL\\_IRDA\\_Receive\\_IT\(\)\*](#)
- [\*HAL\\_IRDA\\_Transmit\\_DMA\(\)\*](#)
- [\*HAL\\_IRDA\\_Receive\\_DMA\(\)\*](#)
- [\*HAL\\_IRDA\\_DMAPause\(\)\*](#)
- [\*HAL\\_IRDA\\_DMAResume\(\)\*](#)
- [\*HAL\\_IRDA\\_DMAStop\(\)\*](#)
- [\*HAL\\_IRDA\\_Abort\(\)\*](#)
- [\*HAL\\_IRDA\\_AbortTransmit\(\)\*](#)
- [\*HAL\\_IRDA\\_AbortReceive\(\)\*](#)
- [\*HAL\\_IRDA\\_Abort\\_IT\(\)\*](#)
- [\*HAL\\_IRDA\\_AbortTransmit\\_IT\(\)\*](#)
- [\*HAL\\_IRDA\\_AbortReceive\\_IT\(\)\*](#)
- [\*HAL\\_IRDA\\_IRQHandler\(\)\*](#)
- [\*HAL\\_IRDA\\_TxCpltCallback\(\)\*](#)
- [\*HAL\\_IRDA\\_TxHalfCpltCallback\(\)\*](#)
- [\*HAL\\_IRDA\\_RxCpltCallback\(\)\*](#)
- [\*HAL\\_IRDA\\_RxHalfCpltCallback\(\)\*](#)
- [\*HAL\\_IRDA\\_ErrorCallback\(\)\*](#)
- [\*HAL\\_IRDA\\_AbortCpltCallback\(\)\*](#)
- [\*HAL\\_IRDA\\_AbortTransmitCpltCallback\(\)\*](#)
- [\*HAL\\_IRDA\\_AbortReceiveCpltCallback\(\)\*](#)

#### 28.2.4 Peripheral State and Error functions

This subsection provides a set of functions allowing to return the State of IrDA communication process and also return Peripheral Errors occurred during communication process

- [\*HAL\\_IRDA\\_GetState\(\)\*](#) API can be helpful to check in run-time the state of the IRDA peripheral handle.
- [\*HAL\\_IRDA\\_GetError\(\)\*](#) checks in run-time errors that could occur during communication.

This section contains the following APIs:

- [\*HAL\\_IRDA\\_GetState\(\)\*](#)
- [\*HAL\\_IRDA\\_GetError\(\)\*](#)

#### 28.2.5 Detailed description of functions

##### **HAL\_IRDA\_Init**

|                      |                                                                                                                                                                                      |

|---------------|-----------------------------------------------------------------|

### **HAL\_IRDA\_TxHalfCpltCallback**

Function name      **void HAL\_IRDA\_TxHalfCpltCallback (IRDA\_HandleTypeDef \* hirda)**

Function description    Tx Half Transfer completed callback.

Parameters            • **hirda:** Pointer to a IRDA\_HandleTypeDef structure that contains the configuration information for the specified USART module.

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| Return values | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul> |
|---------------|-----------------------------------------------------------------|

### **HAL\_IRDA\_RxHalfCpltCallback**

Function name      **void HAL\_IRDA\_RxHalfCpltCallback (IRDA\_HandleTypeDef \* hirda)**

Function description    Rx Half Transfer complete callback.

Parameters            • **hirda:** Pointer to a IRDA\_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| Return values | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul> |
|---------------|-----------------------------------------------------------------|

### **HAL\_IRDA\_ErrorCallback**

Function name      **void HAL\_IRDA\_ErrorCallback (IRDA\_HandleTypeDef \* hirda)**

Function description    IRDA error callback.

Parameters            • **hirda:** Pointer to a IRDA\_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| Return values | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul> |
|---------------|-----------------------------------------------------------------|

### **HAL\_IRDA\_AbortCpltCallback**

Function name      **void HAL\_IRDA\_AbortCpltCallback (IRDA\_HandleTypeDef \* hirda)**

Function description    IRDA Abort Complete callback.

Parameters            • **hirda:** Pointer to a IRDA\_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| Return values | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul> |
|---------------|-----------------------------------------------------------------|

### **HAL\_IRDA\_AbortTransmitCpltCallback**

Function name      **void HAL\_IRDA\_AbortTransmitCpltCallback (IRDA\_HandleTypeDef \* hirda)**

Function description    IRDA Abort Complete callback.

|               |                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameters    | <ul style="list-style-type: none"> <li>• <b>hirda:</b> Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.</li> </ul> |
| Return values | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                                                                                        |

**HAL\_IRDA\_AbortReceiveCpltCallback**

|                      |                                                                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_IRDA_AbortReceiveCpltCallback<br/>(IRDA_HandleTypeDef * hirda)</b>                                                                                                         |
| Function description | IRDA Abort Receive Complete callback.                                                                                                                                                  |

- `__HANDLE__`: specifies the IRDA Handle.

**Return value:**

- None

`__HAL_IRDA_CLEAR_FEFLAG`

**Description:**

- Clear the IRDA FE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the IRDA Handle.

**Return value:**

- None

`__HAL_IRDA_CLEAR_NEFLAG`

**Description:**

- Clear the IRDA NE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the IRDA Handle.

**Return value:**

- None

`__HAL_IRDA_CLEAR_OREFLAG`

**Description:**

- Clear the IRDA ORE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the IRDA Handle.

**Return value:**

- None

`__HAL_IRDA_CLEAR_IDLEFLAG`

**Description:**

- Clear the IRDA IDLE pending flag.

**Parameters:**

- `__HANDLE__`: specifies the IRDA Handle.

**Return value:**

- None

`__HAL_IRDA_GET_FLAG`

**Description:**

- Check whether the specified IRDA flag is set or not.

**Parameters:**

- `__HANDLE__`: specifies the IRDA Handle.
- `__FLAG__`: specifies the flag to check. This parameter can be one of the following values:
  - `IRDA_FLAG_RXACK` Receive enable acknowledge flag
  - `IRDA_FLAG_TXACK` Transmit enable acknowledge flag

- IRDA\_FLAG\_BUSY Busy flag
- IRDA\_FLAG\_ABRF Auto Baud rate detection flag
- IRDA\_FLAG\_ABRE Auto Baud rate detection error flag
- IRDA\_FLAG\_TXE Transmit data register empty flag
- IRDA\_FLAG\_TC Transmission Complete flag
- IRDA\_FLAG\_RXNE Receive data register not empty flag
- IRDA\_FLAG\_ORE OverRun Error flag
- IRDA\_FLAG\_NE Noise Error flag
- IRDA\_FLAG\_FE Framing Error flag
- IRDA\_FLAG\_PE Parity Error flag

**Return value:**

- The new state of \_\_FLAG\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_IRDA\\_ENABLE\\_IT](#)**Description:**

- Enable the specified IRDA interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the IRDA Handle.
- \_\_INTERRUPT\_\_: specifies the IRDA interrupt source to enable. This parameter can be one of the following values:
  - IRDA\_IT\_TXE Transmit Data Register empty interrupt
  - IRDA\_IT\_TC Transmission complete interrupt
  - IRDA\_IT\_RXNE Receive Data register not empty interrupt
  - IRDA\_IT\_IDLE Idle line detection interrupt
  - IRDA\_IT\_PE Parity Error interrupt
  - IRDA\_IT\_ERR Error interrupt(Frame error, noise error, overrun error)

**Return value:**

- None

[\\_\\_HAL\\_IRDA\\_DISABLE\\_IT](#)**Description:**

- Disable the specified IRDA interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the IRDA Handle.
- \_\_INTERRUPT\_\_: specifies the IRDA interrupt source to disable. This parameter can be one of the following values:
  - IRDA\_IT\_TXE Transmit Data Register empty interrupt
  - IRDA\_IT\_TC Transmission complete

- interrupt
  - IRDA\_IT\_RXNE Receive Data register not empty interrupt
  - IRDA\_IT\_IDLE Idle line detection interrupt
  - IRDA\_IT\_PE Parity Error interrupt
  - IRDA\_IT\_ERR Error interrupt(Frame error, noise error, overrun error)

**Return value:**

- None

\_\_HAL\_IRDA\_GET\_IT

**Description:**

- Check whether the specified IRDA interrupt has occurred or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the IRDA Handle.
- \_\_IT\_\_: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA\_IT\_TXE Transmit Data Register empty interrupt
  - IRDA\_IT\_TC Transmission complete interrupt
  - IRDA\_IT\_RXNE Receive Data register not empty interrupt
  - IRDA\_IT\_IDLE Idle line detection interrupt
  - IRDA\_IT\_ORE OverRun Error interrupt
  - IRDA\_IT\_NE Noise Error interrupt
  - IRDA\_IT\_FE Framing Error interrupt
  - IRDA\_IT\_PE Parity Error interrupt

**Return value:**

- The: new state of \_\_IT\_\_ (TRUE or FALSE).

\_\_HAL\_IRDA\_GET\_IT\_SOURCE

**Description:**

- Check whether the specified IRDA interrupt source is enabled or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the IRDA Handle.
- \_\_IT\_\_: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA\_IT\_TXE Transmit Data Register empty interrupt
  - IRDA\_IT\_TC Transmission complete interrupt
  - IRDA\_IT\_RXNE Receive Data register not empty interrupt
  - IRDA\_IT\_IDLE Idle line detection interrupt

- IRDA\_IT\_ERR Framing, overrun or noise error interrupt
- IRDA\_IT\_PE Parity Error interrupt

**Return value:**

- The new state of \_\_IT\_\_ (TRUE or FALSE).

**\_HAL\_IRDA\_CLEAR\_IT****Description:**

- Clear the specified IRDA ISR flag, in setting the proper ICR register flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the IRDA Handle.
- \_\_IT\_CLEAR\_\_: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt. This parameter can be one of the following values:
  - IRDA\_CLEAR\_PEF Parity Error Clear Flag
  - IRDA\_CLEAR\_FEF Framing Error Clear Flag
  - IRDA\_CLEAR\_NEF Noise detected Clear Flag
  - IRDA\_CLEAR\_OREF OverRun Error Clear Flag
  - IRDA\_CLEAR\_TCF Transmission Complete Clear Flag

**Return value:**

- None

**\_HAL\_IRDA\_SEND\_REQ****Description:**

- Set a specific IRDA request flag.

**Parameters:**

- \_\_HANDLE\_\_: specifies the IRDA Handle.
- \_\_REQ\_\_: specifies the request flag to set. This parameter can be one of the following values:
  - IRDA\_AUTOBAUD\_REQUEST Auto-Baud Rate Request
  - IRDA\_RXDATA\_FLUSH\_REQUEST Receive Data flush Request
  - IRDA\_TXDATA\_FLUSH\_REQUEST Transmit data flush Request

**Return value:**

- None

**\_HAL\_IRDA\_ONE\_BIT\_SAMPLE\_ENABLE****Description:**

- Enable the IRDA one bit sample method.

**Parameters:**

- `_HANDLE_`: specifies the IRDA Handle.

**Return value:**

- None

`_HAL_IRDA_ONE_BIT_SAMPLE_DISABLE`

**Description:**

- Disable the IRDA one bit sample method.

**Parameters:**

- `_HANDLE_`: specifies the IRDA Handle.

**Return value:**

- None

`_HAL_IRDA_ENABLE`

**Description:**

- Enable UART/USART associated to IRDA Handle.

**Parameters:**

- `_HANDLE_`: specifies the IRDA Handle.

**Return value:**

- None

`_HAL_IRDA_DISABLE`

**Description:**

- Disable UART/USART associated to IRDA Handle.

**Parameters:**

- `_HANDLE_`: specifies the IRDA Handle.

**Return value:**

- None

***IRDA Flags***

### 30.2 IWDG Firmware driver API description

#### 30.2.1 IWDG Generic features

- The IWDG can be started by either software or hardware (configurable through option byte).
- The IWDG is clocked by Low-Speed clock (LSI) and thus stays active even if the main clock fails.
- Once the IWDG is started, the LSI is forced ON and both can not be disabled. The counter starts counting down from the reset value (0xFFFFU). When it reaches the end of count value (0x000U) a reset signal is generated (IWDG reset).
- Whenever the key value 0x0000 AAAA is written in the IWDG\_KR register, the IWDG\_RLR value is reloaded in the counter and the watchdog reset is prevented.
- The IWDG is implemented in the VDD voltage domain that is still functional in STOP and STANDBY mode (IWDG reset can wake-up from STANDBY). IWDGRST flag in RCC\_CSR register can be used to inform when an IWDG reset occurs.
- Debug mode : When the microcontroller enters debug mode (core halted), the IWDG counter either continues to work normally or stops, depending on DBG\_IWDG\_STOP

configuration bit in DBG module, accessible through  
`__HAL_DBGMCU_FREEZE_IWDG()` and `__HAL_DBGMCU_UNFREEZE_IWDG()`  
 macros

Min-max timeout value @41KHz (LSI): ~0.1ms / ~25.5s The IWDG timeout may vary due to LSI frequency dispersion. STM32F3xx devices provide the capability to measure the LSI frequency (LSI clock connected internally to TIM16 CH1 input capture). The measured value can be used to have an IWDG timeout with an acceptable accuracy.

### 30.2.2 How to use this driver

1. Use IWDG using `HAL_IWDG_Init()` function to :
  - Enable instance by writing Start keyword in IWDG\_KEY register. LSI clock is forced ON and IWDG counter starts downcounting.
  - Enable write access to configuration register: IWDG\_PR, IWDG\_RLR & IWDG\_WINR.
  - Configure the IWDG prescaler and counter reload value. This reload value will be loaded in the IWDG counter each time the watchdog is reloaded, then the IWDG will start counting down from this value.
  - wait for status flags to be reset"
  - Depending on window parameter:
    - If Window Init parameter is same as Window register value, nothing more is done but reload counter value in order to exit function with exact time base.
    - Else modify Window register. This will automatically reload watchdog counter.
2. Then the application program must refresh the IWDG counter at regular intervals during normal operation to prevent an MCU reset, using `HAL_IWDG_Refresh()` function.

#### IWDG HAL driver macros list

Below the list of most used macros in IWDG HAL driver:

- `__HAL_IWDG_START`: Enable the IWDG peripheral
- `__HAL_IWDG_RELOAD_COUNTER`: Reloads IWDG counter with value defined in the reload register

### 30.2.3 Initialization and Start functions

This section provides functions allowing to:

- Initialize the IWDG according to the specified parameters in the IWDG\_InitTypeDef of associated handle.
- Manage Window option.
- Once initialization is performed in `HAL_IWDG_Init` function, Watchdog is reloaded in order to exit function with correct time base.

This section contains the following APIs:

- [`HAL\_IWDG\_Init\(\)`](#)

### 30.2.4 IO operation functions

This section provides functions allowing to:

- Refresh the IWDG.

This section contains the following APIs:

- [`HAL\_IWDG\_Refresh\(\)`](#)

### 30.2.5 Detailed description of functions

## 31.2 NAND Firmware driver API description

### 31.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NAND flash memories. It uses the FMC layer functions to interface with NAND devices. This driver is used as follows:

- NAND flash memory configuration sequence using the function HAL\_NAND\_Init() with control and timing parameters for both common and attribute spaces.
- Read NAND flash memory maker and device IDs using the function HAL\_NAND\_Read\_ID(). The read information is stored in the NAND\_ID\_TypeDef structure declared by the function caller.
- Access NAND flash memory by read/write operations using the functions HAL\_NAND\_Read\_Page\_8b()/HAL\_NAND\_Read\_SpareArea\_8b(),  
HAL\_NAND\_Write\_Page\_8b()/HAL\_NAND\_Write\_SpareArea\_8b(),  
HAL\_NAND\_Read\_Page\_16b()/HAL\_NAND\_Read\_SpareArea\_16b(),  
HAL\_NAND\_Write\_Page\_16b()/HAL\_NAND\_Write\_SpareArea\_16b() to read/write page(s)/spare area(s). These functions use specific device information (Block, page

size..) predefined by the user in the HAL\_NAND\_Info\_TypeDef structure. The read/write address information is contained by the Nand\_Address\_TypeDef structure passed as parameter.

- Perform NAND flash Reset chip operation using the function HAL\_NAND\_Reset().
- Perform NAND flash erase block operation using the function HAL\_NAND\_Erase\_Block(). The erase block address information is contained in the Nand\_Address\_TypeDef structure passed as parameter.
- Read the NAND flash status operation using the function HAL\_NAND\_Read\_Status().
- You can also control the NAND device by calling the control APIs HAL\_NAND\_ECC\_Enable() / HAL\_NAND\_ECC\_Disable() to respectively enable/disable the ECC code correction feature or the function HAL\_NAND\_GetECC() to get the ECC correction code.
- You can monitor the NAND device HAL state by calling the function HAL\_NAND\_GetState()

This driver is a set of generic APIs which handle standard NAND flash operations. If a NAND flash device contains different operations and/or implementations, it should be implemented separately.

### 31.2.2 NAND Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the NAND memory

This section contains the following APIs:

- [\*HAL\\_NAND\\_Init\(\)\*](#)
- [\*HAL\\_NAND\\_DelInit\(\)\*](#)
- [\*HAL\\_NAND\\_MspInit\(\)\*](#)
- [\*HAL\\_NAND\\_MspDelInit\(\)\*](#)
- [\*HAL\\_NAND\\_IRQHandler\(\)\*](#)
- [\*HAL\\_NAND\\_ITCallback\(\)\*](#)
- [\*HAL\\_NAND\\_ConfigDevice\(\)\*](#)
- [\*HAL\\_NAND\\_Read\\_ID\(\)\*](#)

### 31.2.3 NAND Input and Output functions

This section provides functions allowing to use and control the NAND memory

This section contains the following APIs:

- [\*HAL\\_NAND\\_Read\\_ID\(\)\*](#)
- [\*HAL\\_NAND\\_Reset\(\)\*](#)
- [\*HAL\\_NAND\\_ConfigDevice\(\)\*](#)
- [\*HAL\\_NAND\\_Read\\_Page\\_8b\(\)\*](#)
- [\*HAL\\_NAND\\_Read\\_Page\\_16b\(\)\*](#)
- [\*HAL\\_NAND\\_Write\\_Page\\_8b\(\)\*](#)
- [\*HAL\\_NAND\\_Write\\_Page\\_16b\(\)\*](#)
- [\*HAL\\_NAND\\_Read\\_SpareArea\\_8b\(\)\*](#)
- [\*HAL\\_NAND\\_Read\\_SpareArea\\_16b\(\)\*](#)
- [\*HAL\\_NAND\\_Write\\_SpareArea\\_8b\(\)\*](#)
- [\*HAL\\_NAND\\_Write\\_SpareArea\\_16b\(\)\*](#)
- [\*HAL\\_NAND\\_Erase\\_Block\(\)\*](#)
- [\*HAL\\_NAND\\_Read\\_Status\(\)\*](#)
- [\*HAL\\_NAND\\_Address\\_Inc\(\)\*](#)

### 31.2.4 NAND Control functions

This subsection provides a set of functions allowing to control dynamically the NAND interface.

This section contains the following APIs:

- [\*HAL\\_NAND\\_ECC\\_Enable\(\)\*](#)
- [\*HAL\\_NAND\\_ECC\\_Disable\(\)\*](#)
- [\*HAL\\_NAND\\_GetECC\(\)\*](#)

### 31.2.5 NAND State functions

This subsection permits to get in run-time the status of the NAND controller and the data flow.

This section contains the following APIs:

- [\*HAL\\_NAND\\_GetState\(\)\*](#)

### 31.2.6 Detailed description of functions

#### **HAL\_NAND\_Init**

|                      |                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <code>HAL_StatusTypeDef HAL_NAND_Init (NAND_HandleTypeDef * hnand, FMC_NAND_PCC_TimingTypeDef * ComSpace_Timing, FMC_NAND_PCC_TimingTypeDef * AttSpace_Timing)</code>                                                                                                                                                               |
| Function description | Perform NAND memory Initialization sequence.                                                                                                                                                                                                                                                                                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hnand</b>: pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.</li> <li>• <b>ComSpace_Timing</b>: pointer to Common space timing structure</li> <li>• <b>AttSpace_Timing</b>: pointer to Attribute space timing structure</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL</b>: status</li> </ul>                                                                                                                                                                                                                                                              |

#### **HAL\_NAND\_DelInit**

|                      |                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <code>HAL_StatusTypeDef HAL_NAND_DelInit (NAND_HandleTypeDef * hnand)</code>                                                                                             |
| Function description | Perform NAND memory De-Initialization sequence.                                                                                                                          |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hnand</b>: pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL</b>: status</li> </ul>                                                                                                   |

#### **HAL\_NAND\_ConfigDevice**

|                      |                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <code>HAL_StatusTypeDef HAL_NAND_ConfigDevice (NAND_HandleTypeDef * hnand, NAND_DeviceConfigTypeDef * pDeviceConfig)</code>                                              |
| Function description | Configure the device: Enter the physical parameters of the device.                                                                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hnand</b>: pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.</li> </ul> |

- **pDeviceConfig:** pointer to NAND\_DeviceConfigTypeDef structure
- Return values      • **HAL:** status

### **HAL\_NAND\_Read\_ID**

- Function name      **HAL\_StatusTypeDef HAL\_NAND\_Read\_ID  
(NAND\_HandleTypeDef \* hñand, NAND\_IDTypeDef \*  
pNAND\_ID)**
- Function description      Read the NAND memory electronic signature.
- Parameters
  - **hñand:** pointer to a NAND\_HandleTypeDef structure that contains the configuration information for NAND module.
  - **pNAND\_ID:** NAND ID structure
- Return values      • **HAL:** status

### **HAL\_NAND\_MspInit**

- Function name      **void HAL\_NAND\_MspInit (NAND\_HandleTypeDef \* hñand)**
- Function description      NAND MSP Init.
- Parameters
  - **hñand:** pointer to a NAND\_HandleTypeDef structure that contains the configuration information for NAND module.
- Return values      • **None**

### **HAL\_NAND\_MspDelInit**

- Function name      **void HAL\_NAND\_MspDelInit (NAND\_HandleTypeDef \* hñand)**
- Function description      NAND MSP Delinit.
- Parameters
  - **hñand:** pointer to a NAND\_HandleTypeDef structure that contains the configuration information for NAND module.
- Return values      • **None**

### **HAL\_NAND\_IRQHandler**

- Function name      **void HAL\_NAND\_IRQHandler (NAND\_HandleTypeDef \* hñand)**
- Function description      This function handles NAND device interrupt request.
- Parameters
  - **hñand:** pointer to a NAND\_HandleTypeDef structure that contains the configuration information for NAND module.
- Return values      • **HAL:** status

### **HAL\_NAND\_ITCallback**

- Function name      **void HAL\_NAND\_ITCallback (NAND\_HandleTypeDef \* hñand)**
- Function description      NAND interrupt feature callback.
- Parameters
  - **hñand:** pointer to a NAND\_HandleTypeDef structure that contains the configuration information for NAND module.

|                                   |                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 31.3 NAND Firmware driver defines

### 31.3.1 NAND

*NAND Exported Macros*

**\_HAL\_NAND\_RESET\_HANDLE\_STATE** **Description:**

- Reset NAND handle state.

**Parameters:**

- **\_HANDLE\_**: specifies the NAND handle.

**Return value:**

- None

## 32 HAL NOR Generic Driver

### 32.1 NOR Firmware driver registers structures

#### 32.1.1 NOR\_IDTypeDef

##### Data Fields

- `uint16_t Manufacturer_Code`
- `uint16_t Device_Code1`
- `uint16_t Device_Code2`
- `uint16_t Device_Code3`

##### Field Documentation

- `uint16_t NOR_IDTypeDef::Manufacturer_Code`  
Defines the device's manufacturer code used to identify the memory
- `uint16_t NOR_IDTypeDef::Device_Code1`
- `uint16_t NOR_IDTypeDef::Device_Code2`
- `uint16_t NOR_IDTypeDef::Device_Code3`  
Defines the device's codes used to identify the memory. These codes can be accessed by performing read operations with specific control signals and addresses set. They can also be accessed by issuing an Auto Select command.

#### 32.1.2 NOR\_CFITypeDef

##### Data Fields

- `uint16_t CFI_1`
- `uint16_t CFI_2`
- `uint16_t CFI_3`
- `uint16_t CFI_4`

##### Field Documentation

- `uint16_t NOR_CFITypeDef::CFI_1`
- `uint16_t NOR_CFITypeDef::CFI_2`
- `uint16_t NOR_CFITypeDef::CFI_3`
- `uint16_t NOR_CFITypeDef::CFI_4`  
Defines the information stored in the memory's Common flash interface which contains a description of various electrical and timing parameters, density information and functions supported by the memory.

#### 32.1.3 NOR\_HandleTypeDefDef

##### Data Fields

- `FMC_NORSRAM_TypeDef * Instance`
- `FMC_NORSRAM_EXTENDED_TypeDef * Extended`
- `FMC_NORSRAM_InitTypeDef Init`
- `HAL_LockTypeDef Lock`
- `__IO HAL_NOR_StateTypeDef State`

##### Field Documentation

- `FMC_NORSRAM_TypeDef* NOR_HandleTypeDefDef::Instance`  
Register base address

- ***FMC\_NORSRAM\_EXTENDED\_TypeDef\* NOR\_HandleTypeDef::Extended***  
Extended mode register base address
- ***FMC\_NORSRAM\_InitTypeDef NOR\_HandleTypeDef::Init***  
NOR device control configuration parameters
- ***HAL\_LockTypeDef NOR\_HandleTypeDef::Lock***  
NOR locking object
- ***\_\_IO HAL\_NOR\_StateTypeDef NOR\_HandleTypeDef::State***  
NOR device access state

## 32.2 NOR Firmware driver API description

### 32.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NOR flash memories. It uses the FMC layer functions to interface with NOR devices. This driver is used as follows:

- NOR flash memory configuration sequence using the function HAL\_NOR\_Init() with control and timing parameters for both normal and extended mode.
- Read NOR flash memory manufacturer code and device IDs using the function HAL\_NOR\_Read\_ID(). The read information is stored in the NOR\_ID\_TypeDef structure declared by the function caller.
- Access NOR flash memory by read/write data unit operations using the functions HAL\_NOR\_Read(), HAL\_NOR\_Program().
- Perform NOR flash erase block/chip operations using the functions HAL\_NOR\_Erase\_Block() and HAL\_NOR\_Erase\_Chip().
- Read the NOR flash CFI (common flash interface) IDs using the function HAL\_NOR\_Read\_CFI(). The read information is stored in the NOR\_CFI\_TypeDef structure declared by the function caller.
- You can also control the NOR device by calling the control APIs HAL\_NOR\_WriteOperation\_Enable() / HAL\_NOR\_WriteOperation\_Disable() to respectively enable/disable the NOR write operation
- You can monitor the NOR device HAL state by calling the function HAL\_NOR\_GetState()

This driver is a set of generic APIs which handle standard NOR flash operations. If a NOR flash device contains different operations and/or implementations, it should be implemented separately.

### NOR HAL driver macros list

Below the list of most used macros in NOR HAL driver.

- NOR\_WRITE: NOR memory write data to specified address

### 32.2.2 NOR Initialization and de\_initialization functions

This section provides functions allowing to initialize/de-initialize the NOR memory

This section contains the following APIs:

- [\*\*HAL\\_NOR\\_Init\(\)\*\*](#)
- [\*\*HAL\\_NOR\\_DeInit\(\)\*\*](#)
- [\*\*HAL\\_NOR\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_NOR\\_MspDeInit\(\)\*\*](#)
- [\*\*HAL\\_NOR\\_MspWait\(\)\*\*](#)

### 32.2.3 NOR Input and Output functions

This section provides functions allowing to use and control the NOR memory

This section contains the following APIs:

- [\*HAL\\_NOR\\_Read\\_ID\(\)\*](#)
- [\*HAL\\_NOR\\_ReturnToReadMode\(\)\*](#)
- [\*HAL\\_NOR\\_Read\(\)\*](#)
- [\*HAL\\_NOR\\_Program\(\)\*](#)
- [\*HAL\\_NOR\\_ReadBuffer\(\)\*](#)
- [\*HAL\\_NOR\\_ProgramBuffer\(\)\*](#)
- [\*HAL\\_NOR\\_Erase\\_Block\(\)\*](#)
- [\*HAL\\_NOR\\_Erase\\_Chip\(\)\*](#)
- [\*HAL\\_NOR\\_Read\\_CFI\(\)\*](#)

### 32.2.4 NOR Control functions

This subsection provides a set of functions allowing to control dynamically the NOR interface.

This section contains the following APIs:

- [\*HAL\\_NOR\\_WriteOperation\\_Enable\(\)\*](#)
- [\*HAL\\_NOR\\_WriteOperation\\_Disable\(\)\*](#)

### 32.2.5 NOR State functions

This subsection permits to get in run-time the status of the NOR controller and the data flow.

This section contains the following APIs:

- [\*HAL\\_NOR\\_GetState\(\)\*](#)
- [\*HAL\\_NOR\\_GetStatus\(\)\*](#)

### 32.2.6 Detailed description of functions

#### **HAL\_NOR\_Init**

Function name      **HAL\_StatusTypeDef HAL\_NOR\_Init (NOR\_HandleTypeDef \*  
hnor, FMC\_NORSRAM\_TimingTypeDef \* Timing,  
FMC\_NORSRAM\_TimingTypeDef \* ExtTiming)**

Function description      Perform the NOR memory Initialization sequence.

Parameters     
 

- **hnor:** pointer to a NOR\_HandleTypeDef structure that contains the configuration information for NOR module.
- **Timing:** pointer to NOR control timing structure
- **ExtTiming:** pointer to NOR extended mode timing structure

Return values     
 

- **HAL:** status

#### **HAL\_NOR\_DeInit**

Function name      **HAL\_StatusTypeDef HAL\_NOR\_DeInit (NOR\_HandleTypeDef \*  
hnor)**

Function description      Perform NOR memory De-Initialization sequence.

---

### HAL\_NOR\_Program

|                      |                                                                                                                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_NOR_Program (NOR_HandleTypeDef * hnor, uint32_t * pAddress, uint16_t * pData)</b>                                                                                                                                                       |
| Function description | Program data to NOR memory.                                                                                                                                                                                                                                      |
| Parameters           | <ul style="list-style-type: none"> <li><b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li> <li><b>pAddress:</b> Device address</li> <li><b>pData:</b> pointer to the data to write</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>                                                                                                                                                                                             |

### HAL\_NOR\_ReadBuffer

|                      |                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_NOR_ReadBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)</b>                                                                                                                                                                                                                                                               |
| Function description | Reads a block of data from the FMC NOR memory.                                                                                                                                                                                                                                                                                                                                                    |
| Parameters           | <ul style="list-style-type: none"> <li><b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li> <li><b>uwAddress:</b> NOR memory internal address to read from.</li> <li><b>pData:</b> pointer to the buffer that receives the data read from the NOR memory.</li> <li><b>uwBufferSize:</b> number of Half word to read.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                              |

### HAL\_NOR\_ProgramBuffer

|                      |                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_NOR_ProgramBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)</b>                              |
| Function description | Writes a half-word buffer to the FMC NOR memory.                                                                                                                    |
| Parameters           | <ul style="list-style-type: none"> <li><b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li> </ul> |

|               |                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <ul style="list-style-type: none"> <li>• <b>uwAddress:</b> NOR memory internal address from which the data</li> <li>• <b>pData:</b> pointer to source data buffer.</li> <li>• <b>uwBufferSize:</b> number of Half words to write.</li> </ul>                  |
| Return values | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                        |
| Notes         | <ul style="list-style-type: none"> <li>• Some NOR memory need Address aligned to xx bytes (can be aligned to 64 bytes boundary for example).</li> <li>• The maximum buffer size allowed is NOR memory dependent (can be 64 Bytes max for example).</li> </ul> |

### HAL\_NOR\_Erase\_Block

|                      |                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_NOR_Erase_Block<br/>(NOR_HandleTypeDef * hnor, uint32_t BlockAddress, uint32_t Address)</b>                                                                                                                                                   |
| Function description | Erase the specified block of the NOR memory.                                                                                                                                                                                                                           |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li> <li>• <b>BlockAddress:</b> Block to erase address</li> <li>• <b>Address:</b> Device address</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                 |

### HAL\_NOR\_Erase\_Chip

|                      |                                                                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_NOR_Erase_Chip<br/>(NOR_HandleTypeDef * hnor, uint32_t Address)</b>                                                                                                                    |
| Function description | Erase the entire NOR chip.                                                                                                                                                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li> <li>• <b>Address:</b> Device address</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                          |

### HAL\_NOR\_Read\_CFI

|                      |                                                                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_NOR_Read_CFI<br/>(NOR_HandleTypeDef * hnor, NOR_CFITypeDef * pNOR_CFI)</b>                                                                                                                                |
| Function description | Read NOR flash CFI IDs.                                                                                                                                                                                                            |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li> <li>• <b>pNOR_CFI:</b> pointer to NOR CFI IDs structure</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                             |

### HAL\_NOR\_WriteOperation\_Enable

|                      |                                                                                       |
|----------------------|---------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_NOR_WriteOperation_Enable<br/>(NOR_HandleTypeDef * hnor)</b> |
| Function description | Enables dynamically NOR write operation.                                              |

|               |                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameters    | <ul style="list-style-type: none"><li>• <b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li></ul> |
| Return values | <ul style="list-style-type: none"><li>• <b>HAL:</b> status</li></ul>                                                                                                |

### **HAL\_NOR\_WriteOperation\_Disable**

|                      |                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### **HAL\_NOR\_GetStatus**

|                      |                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_NOR_StatusTypeDef HAL_NOR_GetStatus<br/>(NOR_HandleTypeDef * hnor, uint32_t Address, uint32_t Timeout)</b>                                                                                                                                              |
| Function description | Returns the NOR operation status.                                                                                                                                                                                                                              |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hnor:</b> pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.</li><li>• <b>Address:</b> Device address</li><li>• <b>Timeout:</b> NOR programming Timeout</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>NOR_Status:</b> The returned value can be:<br/>HAL_NOR_STATUS_SUCCESS,<br/>HAL_NOR_STATUS_ERROR or<br/>HAL_NOR_STATUS_TIMEOUT</li></ul>                                                                             |

## 32.3 NOR Firmware driver defines

### 32.3.1 NOR

#### *NOR Exported Macros*

`_HAL_NOR_RESET_HANDLE_STATE` **Description:**

- Reset NOR handle state.

**Parameters:**

- `_HANDLE_`: NOR handle

**Return value:**

- None

## 33 HAL OPAMP Generic Driver

### 33.1 OPAMP Firmware driver registers structures

#### 33.1.1 OPAMP\_InitTypeDef

##### Data Fields

- *uint32\_t Mode*
- *uint32\_t InvertingInput*
- *uint32\_t NonInvertingInput*
- *uint32\_t TimerControlledMuxmode*
- *uint32\_t InvertingInputSecondary*
- *uint32\_t NonInvertingInputSecondary*
- *uint32\_t PgaConnect*
- *uint32\_t PgaGain*
- *uint32\_t UserTrimming*
- *uint32\_t TrimmingValueP*
- *uint32\_t TrimmingValueN*

##### Field Documentation

- ***uint32\_t OPAMP\_InitTypeDef::Mode***  
Specifies the OPAMP mode This parameter must be a value of [OPAMP\\_Mode](#) mode is either Standalone, - Follower or PGA
- ***uint32\_t OPAMP\_InitTypeDef::InvertingInput***  
Specifies the inverting input in Standalone & Pga modesIn Standalone mode: i.e when mode is OPAMP\_STANDALONE\_MODE This parameter must be a value of [OPAMP\\_InvertingInput](#) InvertingInput is either VM0 or VM1In PGA mode: i.e when mode is OPAMP\_PGA\_MODE & in Follower mode i.e when mode is OPAMP\_FOLLOWER\_MODE This parameter is Not Applicable
- ***uint32\_t OPAMP\_InitTypeDef::NonInvertingInput***  
Specifies the non inverting input of the opamp: This parameter must be a value of [OPAMP\\_NonInvertingInput](#) NonInvertingInput is either VP0, VP1, VP2 or VP3
- ***uint32\_t OPAMP\_InitTypeDef::TimerControlledMuxmode***  
Specifies if the Timer controlled Mux mode is enabled or disabled This parameter must be a value of [OPAMP\\_TimerControlledMuxmode](#)
- ***uint32\_t OPAMP\_InitTypeDef::InvertingInputSecondary***  
Specifies the inverting input (secondary) of the opamp when TimerControlledMuxmode is enabled i.e. when TimerControlledMuxmode is OPAMP\_TIMERCONTROLLEDMUXMODE\_ENABLEIn Standalone mode: i.e when mode is OPAMP\_STANDALONE\_MODE This parameter must be a value of [OPAMP\\_InvertingInputSecondary](#) InvertingInputSecondary is either VM0 or VM1In PGA mode: i.e when mode is OPAMP\_PGA\_MODE & in Follower mode i.e when mode is OPAMP\_FOLLOWER\_MODE This parameter is Not Applicable
- ***uint32\_t OPAMP\_InitTypeDef::NonInvertingInputSecondary***  
Specifies the non inverting input (secondary) of the opamp when TimerControlledMuxmode is enabled i.e. when TimerControlledMuxmode is OPAMP\_TIMERCONTROLLEDMUXMODE\_ENABLE This parameter must be a value of [OPAMP\\_NonInvertingInputSecondary](#) NonInvertingInput is either VP0, VP1, VP2 or VP3
- ***uint32\_t OPAMP\_InitTypeDef::PgaConnect***  
Specifies the inverting pin in PGA mode i.e. when mode is OPAMP\_PGA\_MODE This

- parameter must be a value of ***OPAMP\_PgaConnect*** Either: not connected, connected to VM0, connected to VM1 (VM0 or VM1 are typically used for external filtering)
- ***uint32\_t OPAMP\_InitTypeDef::PgaGain***  
Specifies the gain in PGA mode i.e. when mode is OPAMP\_PGA\_MODE. This parameter must be a value of ***OPAMP\_PgaGain*** (2U, 4U, 8 or 16U )
  - ***uint32\_t OPAMP\_InitTypeDef::UserTrimming***  
Specifies the trimming mode This parameter must be a value of ***OPAMP\_UserTrimming*** UserTrimming is either factory or user trimming
  - ***uint32\_t OPAMP\_InitTypeDef::TrimmingValueP***  
Specifies the offset trimming value (PMOS) i.e. when UserTrimming is OPAMP\_TRIMMING\_USER. This parameter must be a number between Min\_Data = 1 and Max\_Data = 31U
  - ***uint32\_t OPAMP\_InitTypeDef::TrimmingValueN***  
Specifies the offset trimming value (NMOS) i.e. when UserTrimming is OPAMP\_TRIMMING\_USER. This parameter must be a number between Min\_Data = 1 and Max\_Data = 31U

### 33.1.2 OPAMP\_HandleTypeDef

#### Data Fields

- ***OPAMP\_TypeDef \* Instance***
- ***OPAMP\_InitTypeDef Init***
- ***HAL\_StatusTypeDef Status***
- ***HAL\_LockTypeDef Lock***
- ***\_\_IO HAL\_OPAMP\_StateTypeDef State***

#### Field Documentation

- ***OPAMP\_TypeDef\* OPAMP\_HandleTypeDef::Instance***  
OPAMP instance's registers base address
- ***OPAMP\_InitTypeDef OPAMP\_HandleTypeDef::Init***  
OPAMP required parameters
- ***HAL\_StatusTypeDef OPAMP\_HandleTypeDef::Status***  
OPAMP peripheral status
- ***HAL\_LockTypeDef OPAMP\_HandleTypeDef::Lock***  
Locking object
- ***\_\_IO HAL\_OPAMP\_StateTypeDef OPAMP\_HandleTypeDef::State***  
OPAMP communication state

## 33.2 OPAMP Firmware driver API description

### 33.2.1 OPAMP Peripheral Features

The device integrates up to 4 operational amplifiers OPAMP1, OPAMP2, OPAMP3 and OPAMP4:

1. The OPAMP(s) provides several exclusive running modes.
  - Standalone mode
  - Programmable Gain Amplifier (PGA) mode (Resistor feedback output)
  - Follower mode
2. The OPAMP(s) provide(s) calibration capabilities.
  - Calibration aims at correcting some offset for running mode.
  - The OPAMP uses either factory calibration settings OR user defined calibration (trimming) settings (i.e. trimming mode).
  - The user defined settings can be figured out using self calibration handled by HAL\_OPAMP\_SelfCalibrate, HAL\_OPAMPEx\_SelfCalibrateAll

- HAL\_OPAMP\_SelfCalibrate:
  - Runs automatically the calibration in 2 steps. (90U% of VDDA for NMOS transistors, 10U% of VDDA for PMOS transistors). (As OPAMP is Rail-to-rail input/output, these 2 steps calibration is appropriate and enough in most cases).
  - Enables the user trimming mode
  - Updates the init structure with trimming values with fresh calibration results. The user may store the calibration results for larger (ex monitoring the trimming as a function of temperature for instance)
  - for STM32F3 devices having 2 or 4 OPAMPs HAL\_OPAMPEx\_SelfCalibrateAll runs calibration of 2 or 4 OPAMPs in parallel.
3. For any running mode, an additional Timer-controlled Mux (multiplexer) mode can be set on top.
    - Timer-controlled Mux mode allows Automatic switching between inverting and non-inverting input.
    - Hence on top of defaults (primary) inverting and non-inverting inputs, the user shall select secondary inverting and non inverting inputs.
    - TIM1 CC6 provides the alternate switching tempo between defaults (primary) and secondary inputs.
  4. Running mode: Standalone mode
    - Gain is set externally (gain depends on external loads).
    - Follower mode also possible externally by connecting the inverting input to the output.
  5. Running mode: Follower mode
    - No Inverting Input is connected.
  6. Running mode: Programmable Gain Amplifier (PGA) mode (Resistor feedback output)
    - The OPAMP(s) output(s) can be internally connected to resistor feedback output.
    - OPAMP gain is either 2U, 4U, 8 or 16.

### 33.2.2 How to use this driver

#### Calibration

To run the opamp calibration self calibration:

1. Start calibration using HAL\_OPAMP\_SelfCalibrate. Store the calibration results.

#### Running mode

To use the opamp, perform the following steps:

1. Fill in the HAL\_OPAMP\_MspInit() to
  - Configure the opamp input AND output in analog mode using HAL\_GPIO\_Init() to map the opamp output to the GPIO pin.
2. Configure the opamp using HAL\_OPAMP\_Init() function:
  - Select the mode
  - Select the inverting input
  - Select the non-inverting input
  - Select if the Timer controlled Mux mode is enabled/disabled
  - If the Timer controlled Mux mode is enabled, select the secondary inverting input
  - If the Timer controlled Mux mode is enabled, Select the secondary non-inverting input
  - If PGA mode is enabled, Select if inverting input is connected.
  - Select either factory or user defined trimming mode.

- If the user defined trimming mode is enabled, select PMOS & NMOS trimming values (typ. settings returned by HAL\_OPAMP\_SelfCalibrate function).
- 3. Enable the opamp using HAL\_OPAMP\_Start() function.
- 4. Disable the opamp using HAL\_OPAMP\_Stop() function.
- 5. Lock the opamp in running mode using HAL\_OPAMP\_Lock() function. From then The configuration can be modified
  - After HW reset
  - OR thanks to HAL\_OPAMP\_MspDelnit called (user defined) from HAL\_OPAMP\_Delinit.

### **Running mode: change of configuration while OPAMP ON**

To Re-configure OPAMP when OPAMP is ON (change on the fly)

1. If needed, Fill in the HAL\_OPAMP\_MsplInit()
  - This is the case for instance if you wish to use new OPAMP I/O
2. Configure the opamp using HAL\_OPAMP\_Init() function:
  - As in configure case, selects first the parameters you wish to modify.

### **33.2.3 Initialization and de-initialization functions**

This section provides functions allowing to:

This section contains the following APIs:

- [\*HAL\\_OPAMP\\_Init\(\)\*](#)
- [\*HAL\\_OPAMP\\_Delinit\(\)\*](#)
- [\*HAL\\_OPAMP\\_MsplInit\(\)\*](#)
- [\*HAL\\_OPAMP\\_MspDelinit\(\)\*](#)

### **33.2.4 IO operation functions**

This subsection provides a set of functions allowing to manage the OPAMP data transfers.

This section contains the following APIs:

- [\*HAL\\_OPAMP\\_Start\(\)\*](#)
- [\*HAL\\_OPAMP\\_Stop\(\)\*](#)
- [\*HAL\\_OPAMP\\_SelfCalibrate\(\)\*](#)

### **33.2.5 Peripheral Control functions**

This subsection provides a set of functions allowing to control the OPAMP data transfers.

This section contains the following APIs:

- [\*HAL\\_OPAMP\\_Lock\(\)\*](#)

### **33.2.6 Peripheral State functions**

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- [\*HAL\\_OPAMP\\_GetState\(\)\*](#)
- [\*HAL\\_OPAMP\\_GetTrimOffset\(\)\*](#)

### 33.2.7 Detailed description of functions

#### HAL\_OPAMP\_Init

|                      |                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_OPAMP_Init<br/>(OPAMP_HandleTypeDef * hopamp)</b>                                                                                                   |
| Function description | Initializes the OPAMP according to the specified parameters in the OPAMP_InitTypeDef and create the associated handle.                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hopamp:</b> OPAMP handle</li> </ul>                                                                                              |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                       |
| Notes                | <ul style="list-style-type: none"> <li>• If the selected opamp is locked, initialization can't be performed. To unlock the configuration, perform a system reset.</li> </ul> |

#### HAL\_OPAMP\_DeInit

|                      |                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_OPAMP_DeInit<br/>(OPAMP_HandleTypeDef * hopamp)</b>                                                                                                       |
| Function description | Deinitializes the OPAMP peripheral.                                                                                                                                                |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hopamp:</b> OPAMP handle</li> </ul>                                                                                                    |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                             |
| Notes                | <ul style="list-style-type: none"> <li>• Deinitialization can't be performed if the OPAMP configuration is locked. To unlock the configuration, perform a system reset.</li> </ul> |

#### HAL\_OPAMP\_MspInit

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| Function name        | <b>void HAL_OPAMP_MspInit (OPAMP_HandleTypeDef * hopamp)</b>                    |
| Function description | Initializes the OPAMP MSP.                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hopamp:</b> OPAMP handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                 |

#### HAL\_OPAMP\_MspDeInit

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| Function name        | <b>void HAL_OPAMP_MspDeInit (OPAMP_HandleTypeDef * hopamp)</b>                  |
| Function description | Deinitializes OPAMP MSP.                                                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hopamp:</b> OPAMP handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                 |

#### HAL\_OPAMP\_Start

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_OPAMP_Start<br/>(OPAMP_HandleTypeDef * hopamp)</b> |
| Function description | Start the opamp.                                                            |

---

|               |                                                                             |
|---------------|-----------------------------------------------------------------------------|
| Parameters    | <ul style="list-style-type: none"><li><b>hopamp:</b> OPAMP handle</li></ul> |
| Return values | <ul style="list-style-type: none"><li><b>HAL:</b> status</li></ul>          |

### HAL\_OPAMP\_Stop

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_OPAMP_Stop<br/>(OPAMP_HandleTypeDef * hopamp)</b>  |
| Function description | Stop the opamp.                                                             |
| Parameters           | <ul style="list-style-type: none"><li><b>hopamp:</b> OPAMP handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li><b>HAL:</b> status</li></ul>          |

### HAL\_OPAMP\_SelfCalibrate

|                      |                                                                                                                                                               |

### 35.2 PCCARD Firmware driver API description

#### 35.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control PCCARD/compact flash memories. It uses the FMC layer functions to interface with PCCARD devices. This driver is used for:

- PCCARD/compact flash memory configuration sequence using the function `HAL_PCCARD_Init()` with control and timing parameters for both common and attribute spaces.
- Read PCCARD/compact flash memory maker and device IDs using the function `HAL_PCCARD_Read_ID()`. The read information is stored in the `CompactFlash_ID` structure declared by the function caller.
- Access PCCARD/compact flash memory by read/write operations using the functions `HAL_PCCARD_Read_Sector()`/`HAL_PCCARD_Write_Sector()`, to read/write sector.
- Perform PCCARD/compact flash Reset chip operation using the function `HAL_PCCARD_Reset()`.
- Perform PCCARD/compact flash erase sector operation using the function `HAL_PCCARD_Erase_Sector()`.
- Read the PCCARD/compact flash status operation using the function `HAL_PCCARD_ReadStatus()`.
- You can monitor the PCCARD/compact flash device HAL state by calling the function `HAL_PCCARD_GetState()`

This driver is a set of generic APIs which handle standard PCCARD/compact flash operations. If a PCCARD/compact flash device contains different operations and/or implementations, it should be implemented separately.

### 35.2.2 PCCARD Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the PCCARD memory

This section contains the following APIs:

- [\*HAL\\_PCCARD\\_Init\(\)\*](#)
- [\*HAL\\_PCCARD\\_DelInit\(\)\*](#)
- [\*HAL\\_PCCARD\\_MspInit\(\)\*](#)
- [\*HAL\\_PCCARD\\_MspDelInit\(\)\*](#)

### 35.2.3 PCCARD Input Output and memory functions

This section provides functions allowing to use and control the PCCARD memory

This section contains the following APIs:

- [\*HAL\\_PCCARD\\_Read\\_ID\(\)\*](#)
- [\*HAL\\_PCCARD\\_Read\\_Sector\(\)\*](#)
- [\*HAL\\_PCCARD\\_Write\\_Sector\(\)\*](#)
- [\*HAL\\_PCCARD\\_Erase\\_Sector\(\)\*](#)
- [\*HAL\\_PCCARD\\_Reset\(\)\*](#)
- [\*HAL\\_PCCARD\\_IRQHandler\(\)\*](#)
- [\*HAL\\_PCCARD\\_ITCallback\(\)\*](#)

### 35.2.4 PCCARD Peripheral State functions

This subsection permits to get in run-time the status of the PCCARD controller and the data flow.

This section contains the following APIs:

- [\*HAL\\_PCCARD\\_GetState\(\)\*](#)
- [\*HAL\\_PCCARD\\_GetStatus\(\)\*](#)
- [\*HAL\\_PCCARD\\_ReadStatus\(\)\*](#)

### 35.2.5 Detailed description of functions

## 36 HAL PCD Generic Driver

### 36.1 PCD Firmware driver registers structures

#### 36.1.1 PCD\_InitTypeDef

##### Data Fields

- *uint32\_t dev\_endpoints*
- *uint32\_t speed*
- *uint32\_t ep0\_mps*
- *uint32\_t phy\_itface*
- *uint32\_t Sof\_enable*
- *uint32\_t low\_power\_enable*
- *uint32\_t lpm\_enable*
- *uint32\_t battery\_charging\_enable*

##### Field Documentation

- ***uint32\_t PCD\_InitTypeDef::dev\_endpoints***  
Device Endpoints number. This parameter depends on the used USB core. This parameter must be a number between Min\_Data = 1 and Max\_Data = 15
- ***uint32\_t PCD\_InitTypeDef::speed***  
USB Core speed. This parameter can be any value of [PCD\\_Core\\_Speed](#)
- ***uint32\_t PCD\_InitTypeDef::ep0\_mps***  
Set the Endpoint 0 Max Packet size. This parameter can be any value of [PCD\\_EP0\\_MPS](#)
- ***uint32\_t PCD\_InitTypeDef::phy\_itface***  
Select the used PHY interface. This parameter can be any value of [PCD\\_Core\\_PHY](#)
- ***uint32\_t PCD\_InitTypeDef::Sof\_enable***  
Enable or disable the output of the SOF signal. This parameter can be set to ENABLE or DISABLE
- ***uint32\_t PCD\_InitTypeDef::low\_power\_enable***  
Enable or disable Low Power mode This parameter can be set to ENABLE or DISABLE
- ***uint32\_t PCD\_InitTypeDef::lpm\_enable***  
Enable or disable the Link Power Management . This parameter can be set to ENABLE or DISABLE
- ***uint32\_t PCD\_InitTypeDef::battery\_charging\_enable***  
Enable or disable Battery charging. This parameter can be set to ENABLE or DISABLE

#### 36.1.2 PCD\_EPTypeDef

##### Data Fields

- *uint8\_t num*
- *uint8\_t is\_in*
- *uint8\_t is\_stall*
- *uint8\_t type*
- *uint16\_t pmaaddress*
- *uint16\_t pmaaddr0*
- *uint16\_t pmaaddr1*
- *uint8\_t doublebuffer*

- *uint32\_t maxpacket*
- *uint8\_t \* xfer\_buff*
- *uint32\_t xfer\_len*
- *uint32\_t xfer\_count*

#### Field Documentation

- *uint8\_t PCD\_EPTypedef::num*  
Endpoint number This parameter must be a number between Min\_Data = 1 and Max\_Data = 15
- *uint8\_t PCD\_EPTypedef::is\_in*  
Endpoint direction This parameter must be a number between Min\_Data = 0 and Max\_Data = 1
- *uint8\_t PCD\_EPTypedef::is\_stall*  
Endpoint stall condition This parameter must be a number between Min\_Data = 0 and Max\_Data = 1
- *uint8\_t PCD\_EPTypedef::type*  
Endpoint type This parameter can be any value of [PCD\\_EP\\_Type](#)
- *uint16\_t PCD\_EPTypedef::pmaaddress*  
PMA Address This parameter can be any value between Min\_addr = 0 and Max\_addr = 1K
- *uint16\_t PCD\_EPTypedef::pmaaddr0*  
PMA Address0 This parameter can be any value between Min\_addr = 0 and Max\_addr = 1K
- *uint16\_t PCD\_EPTypedef::pmaaddr1*  
PMA Address1 This parameter can be any value between Min\_addr = 0 and Max\_addr = 1K
- *uint8\_t PCD\_EPTypedef::doublebuffer*  
Double buffer enable This parameter can be 0 or 1
- *uint32\_t PCD\_EPTypedef::maxpacket*  
Endpoint Max packet size This parameter must be a number between Min\_Data = 0 and Max\_Data = 64KB
- *uint8\_t\* PCD\_EPTypedef::xfer\_buff*  
Pointer to transfer buffer
- *uint32\_t PCD\_EPTypedef::xfer\_len*  
Current transfer length
- *uint32\_t PCD\_EPTypedef::xfer\_count*  
Partial transfer length in case of multi packet transfer

### 36.1.3 PCD\_HandleTypeDefDef

#### Data Fields

- *PCD\_TypeDef \* Instance*
- *PCD\_InitTypeDef Init*
- *\_IO uint8\_t USB\_Address*
- *PCD\_EPTypedef IN\_ep*
- *PCD\_EPTypedef OUT\_ep*
- *HAL\_LockTypeDef Lock*
- *\_IO PCD\_StateTypeDef State*
- *uint32\_t Setup*
- *void \* pData*

#### Field Documentation

- *PCD\_TypeDef\* PCD\_HandleTypeDefDef::Instance*  
Register base address

- ***PCD\_InitTypeDef PCD\_HandleTypeDef::Init***  
PCD required parameters
- ***\_IO uint8\_t PCD\_HandleTypeDef::USB\_Address***  
USB Address
- ***PCD\_EPTypeDef PCD\_HandleTypeDef::IN\_ep[15]***  
IN endpoint parameters
- ***PCD\_EPTypeDef PCD\_HandleTypeDef::OUT\_ep[15]***  
OUT endpoint parameters
- ***HAL\_LockTypeDef PCD\_HandleTypeDef::Lock***  
PCD peripheral status
- ***\_IO PCD\_StateTypeDef PCD\_HandleTypeDef::State***  
PCD communication state
- ***uint32\_t PCD\_HandleTypeDef::Setup[12]***  
Setup packet buffer
- ***void\* PCD\_HandleTypeDef::pData***  
Pointer to upper stack Handler

## 36.2 PCD Firmware driver API description

### 36.2.1 How to use this driver

The PCD HAL driver can be used as follows:

1. Declare a PCD\_HandleTypeDef handle structure, for example: PCD\_HandleTypeDef hpcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL\_PCD\_Init() API to initialize the HCD peripheral (Core, Device core, ...)
4. Initialize the PCD low level resources through the HAL\_PCD\_MspInit() API:
  - a. Enable the PCD/USB Low Level interface clock using
    - \_\_HAL\_RCC\_USB\_CLK\_ENABLE();
  - b. Initialize the related GPIO clocks
  - c. Configure PCD pin-out
  - d. Configure PCD NVIC interrupt
5. Associate the Upper USB device stack to the HAL PCD Driver:
  - a. hpcd.pData = pdev;
6. Enable HCD transmission and reception:
  - a. HAL\_PCD\_Start();

### 36.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

This section contains the following APIs:

- [\*\*HAL\\_PCD\\_Init\(\)\*\*](#)
- [\*\*HAL\\_PCD\\_DelInit\(\)\*\*](#)
- [\*\*HAL\\_PCD\\_MspInit\(\)\*\*](#)
- [\*\*HAL\\_PCD\\_MspDelInit\(\)\*\*](#)

### 36.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PCD data transfers.

This section contains the following APIs:

- [\*\*HAL\\_PCD\\_Start\(\)\*\*](#)
- [\*\*HAL\\_PCD\\_Stop\(\)\*\*](#)
- [\*\*HAL\\_PCD\\_IRQHandler\(\)\*\*](#)

- [\*HAL\\_PCD\\_DataOutStageCallback\(\)\*](#)
- [\*HAL\\_PCD\\_DataInStageCallback\(\)\*](#)
- [\*HAL\\_PCD\\_SetupStageCallback\(\)\*](#)
- [\*HAL\\_PCD\\_SOFCallback\(\)\*](#)
- [\*HAL\\_PCD\\_ResetCallback\(\)\*](#)
- [\*HAL\\_PCD\\_SuspendCallback\(\)\*](#)
- [\*HAL\\_PCD\\_ResumeCallback\(\)\*](#)
- [\*HAL\\_PCD\\_ISOOUTIncompleteCallback\(\)\*](#)
- [\*HAL\\_PCD\\_ISOINIncompleteCallback\(\)\*](#)
- [\*HAL\\_PCD\\_ConnectCallback\(\)\*](#)
- [\*HAL\\_PCD\\_DisconnectCallback\(\)\*](#)

### 36.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the PCD data transfers.

This section contains the following APIs:

- [\*HAL\\_PCD\\_DevConnect\(\)\*](#)
- [\*HAL\\_PCD\\_DevDisconnect\(\)\*](#)
- [\*HAL\\_PCD\\_SetAddress\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_Open\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_Close\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_Receive\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_GetRxCount\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_Transmit\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_SetStall\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_ClrStall\(\)\*](#)
- [\*HAL\\_PCD\\_EP\\_Flush\(\)\*](#)
- [\*HAL\\_PCD\\_ActivateRemoteWakeup\(\)\*](#)
- [\*HAL\\_PCD\\_DeActivateRemoteWakeup\(\)\*](#)
- [\*HAL\\_PCD\\_ActiveRemoteWakeup\(\)\*](#)
- [\*HAL\\_PCD\\_DeActiveRemoteWakeup\(\)\*](#)

### 36.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- [\*HAL\\_PCD\\_GetState\(\)\*](#)

### 36.2.6 Detailed description of functions

#### **HAL\_PCD\_Init**

|                      |                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_Init (PCD_HandleTypeDef * hpcd)</b>                                                   |
| Function description | Initializes the PCD according to the specified parameters in the PCD_InitTypeDef and create the associated handle. |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul>                                        |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                             |

**HAL\_PCD\_DelInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_DelInit (PCD_HandleTypeDef * hpcd)</b>         |
| Function description | Deinitializes the PCD peripheral.                                           |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>      |

**HAL\_PCD\_MspInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_MspInit (PCD_HandleTypeDef * hpcd)</b>                      |
| Function description | Initializes the PCD MSP.                                                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_PCD\_MspDeInit**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_MspDeInit (PCD_HandleTypeDef * hpcd)</b>                    |
| Function description | Deinitializes PCD MSP.                                                      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_PCD\_Start**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_Start (PCD_HandleTypeDef * hpcd)</b>           |
| Function description | Start the USB device.                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>      |

**HAL\_PCD\_Stop**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_Stop (PCD_HandleTypeDef * hpcd)</b>            |
| Function description | Stop the USB device.                                                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>      |

**HAL\_PCD\_IRQHandler**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_IRQHandler (PCD_HandleTypeDef * hpcd)</b>                   |
| Function description | This function handles PCD interrupt request.                                |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>      |

**HAL\_PCD\_DataOutStageCallback**

|                      |                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_DataOutStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)</b>                                   |
| Function description | Data out stage callbacks.                                                                                            |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> <li>• <b>epnum:</b> endpoint number</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                      |

**HAL\_PCD\_DataInStageCallback**

|                      |                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_DataInStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)</b>                                    |
| Function description | Data IN stage callbacks.                                                                                             |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> <li>• <b>epnum:</b> endpoint number</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                                                      |

**HAL\_PCD\_SetupStageCallback**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_SetupStageCallback (PCD_HandleTypeDef * hpcd)</b>           |
| Function description | Setup stage callback.                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_PCD\_SOFCallback**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_SOFCallback (PCD_HandleTypeDef * hpcd)</b>                  |
| Function description | USB Start Of Frame callbacks.                                               |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_PCD\_ResetCallback**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_ResetCallback (PCD_HandleTypeDef * hpcd)</b>                |
| Function description | USB Reset callbacks.                                                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

**HAL\_PCD\_SuspendCallback**

|                      |                                                                |
|----------------------|----------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_SuspendCallback (PCD_HandleTypeDef * hpcd)</b> |
| Function description | Suspend event callbacks.                                       |

---

|               |                                                                           |
|---------------|---------------------------------------------------------------------------|
| Parameters    | <ul style="list-style-type: none"><li>• <b>hpcd:</b> PCD handle</li></ul> |
| Return values | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>             |

### **HAL\_PCD\_ResumeCallback**

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_ResumeCallback (PCD_HandleTypeDef * hpcd)</b>             |
| Function description | Resume event callbacks.                                                   |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hpcd:</b> PCD handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>             |

### **HAL\_PCD\_ISOOUTIncompleteCallback**

|                      |                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_ISOOUTIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epi)</b>                            |
| Function description | Incomplete ISO OUT callbacks.                                                                                   |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hpcd:</b> PCD handle</li><li>• <b>epi:</b> endpoint number</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>                                                   |

### **HAL\_PCD\_ISOINIncompleteCallback**

|                      |                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_ISOINIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epi)</b>                             |
| Function description | Incomplete ISO IN callbacks.                                                                                    |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hpcd:</b> PCD handle</li><li>• <b>epi:</b> endpoint number</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>                                                   |

### **HAL\_PCD\_ConnectCallback**

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_ConnectCallback (PCD_HandleTypeDef * hpcd)</b>            |
| Function description | Connection event callbacks.                                               |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hpcd:</b> PCD handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>             |

### **HAL\_PCD\_DisconnectCallback**

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>void HAL_PCD_DisconnectCallback (PCD_HandleTypeDef * hpcd)</b>         |
| Function description | Disconnection event callbacks.                                            |
| Parameters           | <ul style="list-style-type: none"><li>• <b>hpcd:</b> PCD handle</li></ul> |
| Return values        | <ul style="list-style-type: none"><li>• <b>None</b></li></ul>             |

**HAL\_PCD\_DevConnect**

Function name      **HAL\_StatusTypeDef HAL\_PCD\_DevConnect  
(PCD\_HandleTypeDef \* hpcd)**

Function description      Connect the USB device.

Parameters      • **hpcd:** PCD handle

Return values      • **HAL:** status

**HAL\_PCD\_DevDisconnect**

Function name      **HAL\_StatusTypeDef HAL\_PCD\_DevDisconnect  
(PCD\_HandleTypeDef \* hpcd)**

Function description      Disconnect the USB device.

Parameters      • **hpcd:** PCD handle

Return values      • **HAL:** status

**HAL\_PCD\_SetAddress**

Function name      **HAL\_StatusTypeDef HAL\_PCD\_SetAddress  
(PCD\_HandleTypeDef \* hpcd, uint8\_t address)**

Function description      Set the USB Device address.

Parameters      • **hpcd:** PCD handle

• **address:** new device address

Return values      • **HAL:** status

**HAL\_PCD\_EP\_Open**

Function name      **HAL\_StatusTypeDef HAL\_PCD\_EP\_Open  
(PCD\_HandleTypeDef \* hpcd, uint8\_t ep\_addr, uint16\_t  
ep\_mps, uint8\_t ep\_type)**

Function description      Open and configure an endpoint.

Parameters      • **hpcd:** PCD handle

• **ep\_addr:** endpoint address

• **ep\_mps:** endpoint max packet size

• **ep\_type:** endpoint type

Return values      • **HAL:** status

**HAL\_PCD\_EP\_Close**

Function name      **HAL\_StatusTypeDef HAL\_PCD\_EP\_Close  
(PCD\_HandleTypeDef \* hpcd, uint8\_t ep\_addr)**

Function description      Deactivate an endpoint.

Parameters      • **hpcd:** PCD handle

• **ep\_addr:** endpoint address

Return values      • **HAL:** status

**HAL\_PCD\_EP\_Receive**

|                      |                                                                                                                                                                                                                                      |

### HAL\_PCD\_EP\_Flush

|                      |                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_EP_Flush<br/>(PCD_HandleTypeDef * hpcd, uint8_t ep_addr)</b>                           |
| Function description | Flush an endpoint.                                                                                                  |
| Parameters           | <ul style="list-style-type: none"> <li><b>hpcd:</b> PCD handle</li> <li><b>ep_addr:</b> endpoint address</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>                                                |

### HAL\_PCD\_ActivateRemoteWakeup

|                      |                                                                                      |
|----------------------|--------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_ActivateRemoteWakeup<br/>(PCD_HandleTypeDef * hpcd)</b> |
| Function description | HAL_PCD_ActivateRemoteWakeup : active remote wakeup signalling.                      |
| Parameters           | <ul style="list-style-type: none"> <li><b>hpcd:</b> PCD handle</li> </ul>            |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>                 |

### HAL\_PCD\_DeActivateRemoteWakeup

|                      |                                                                                        |
|----------------------|----------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_DeActivateRemoteWakeup<br/>(PCD_HandleTypeDef * hpcd)</b> |
| Function description | HAL_PCD_DeActivateRemoteWakeup : de-active remote wakeup signalling.                   |
| Parameters           | <ul style="list-style-type: none"> <li><b>hpcd:</b> PCD handle</li> </ul>              |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> status</li> </ul>                   |

### HAL\_PCD\_GetState

|                      |                                                                           |
|----------------------|---------------------------------------------------------------------------|
| Function name        | <b>PCD_StateTypeDef HAL_PCD_GetState (PCD_HandleTypeDef<br/>* hpcd)</b>   |
| Function description | Return the PCD state.                                                     |
| Parameters           | <ul style="list-style-type: none"> <li><b>hpcd:</b> PCD handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li><b>HAL:</b> state</li> </ul>       |

### HAL\_PCD\_ActiveRemoteWakeup

|                      |                                                                                    |
|----------------------|------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_PCD_ActiveRemoteWakeup<br/>(PCD_HandleTypeDef * hpcd)</b> |
| Function description |                                                                                    |

**HAL\_PCD\_DeActiveRemoteWakeUp**

Function name      **HAL\_StatusTypeDef HAL\_PCD\_DeActiveRemoteWakeUp  
(PCD\_HandleTypeDef \* hpcd)**

Function description

**PCD\_WritePMA**

Function name      **void PCD\_WritePMA (USB\_TypeDef \* USBx, uint8\_t \* pbUsrBuf, uint16\_t wPMABufAddr, uint16\_t wNBytes)**

Function description      Copy a buffer from user memory area to packet memory area (PMA)

Parameters     

- **USBx:** USB peripheral instance register address.
- **pbUsrBuf:** pointer to user memory area.
- **wPMABufAddr:** address into PMA.
- **wNBytes:** no. of bytes to be copied.

Return values     

- **None**

**PCD\_ReadPMA**

Function name      **void PCD\_ReadPMA (USB\_TypeDef \* USBx, uint8\_t \* pbUsrBuf, uint16\_t wPMABufAddr, uint16\_t wNBytes)**

Function description      Copy a buffer from user memory area to packet memory area (PMA)

Parameters     

- **USBx:** USB peripheral instance register address.
- **pbUsrBuf:** pointer to user memory area.
- **wPMABufAddr:** address into PMA.
- **wNBytes:** no. of bytes to be copied.

Return values     

- **None**

## 37 HAL PCD Extension Driver

### 37.1 PCDEEx Firmware driver API description

#### 37.1.1 Extended Peripheral Control functions

This section provides functions allowing to:

- Update PMA configuration

This section contains the following APIs:

- [\*HAL\\_PCDEEx\\_PMACConfig\(\)\*](#)
- [\*HAL\\_PCDEEx\\_SetConnectionState\(\)\*](#)

#### 37.1.2 Detailed description of functions

##### **HAL\_PCDEEx\_PMACConfig**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 37.2 PCDEEx Firmware driver defines

### 37.2.1 PCDEEx

#### *PCD Extended Exported Macros*

`PCD_EP_TX_ADDRESS` **Description:**

- Gets address in an endpoint register.

**Parameters:**

- USBx: USB peripheral instance register address.
- bEpNum: Endpoint Number.

**Return value:**

- None

`PCD_EP_TX_CNT`

`PCD_EP_RX_ADDRESS`

`PCD_EP_RX_CNT`

`PCD_SET_EP_RX_CNT`

## 38 HAL PWR Generic Driver

### 38.1 PWR Firmware driver API description

#### 38.1.1 Initialization and de-initialization functions

After reset, the backup domain (RTC registers, RTC backup data registers and backup SRAM) is protected against possible unwanted write accesses. To enable access to the RTC Domain and RTC registers, proceed as follows:

- Enable the Power Controller (PWR) APB1 interface clock using the `__HAL_RCC_PWR_CLK_ENABLE()` macro.
- Enable access to RTC domain using the `HAL_PWR_EnableBkUpAccess()` function.

#### 38.1.2 Peripheral Control functions

##### WakeUp pin configuration

- WakeUp pin is used to wakeup the system from Standby mode. This pin is forced in input pull down configuration and is active on rising edges.
- There are up to three WakeUp pins:
  - WakeUp Pin 1 on PA.00.
  - WakeUp Pin 2 on PC.13 (STM32F303xC, STM32F303xE only).
  - WakeUp Pin 3 on PE.06.

##### Main and Backup Regulators configuration

- When the backup domain is supplied by VDD (analog switch connected to VDD) the backup SRAM is powered from VDD which replaces the VBAT power supply to save battery life.
- The backup SRAM is not mass erased by a tamper event. It is read protected to prevent confidential data, such as cryptographic private key, from being accessed. The backup SRAM can be erased only through the Flash interface when a protection level change from level 1 to level 0 is requested. Refer to the description of Read protection (RDP) in the Flash programming manual. Refer to the datasheets for more details.

##### Low Power modes configuration

The devices feature 3 low-power modes:

- Sleep mode: Cortex-M4 core stopped, peripherals kept running.
- Stop mode: all clocks are stopped, regulator running, regulator in low power mode
- Standby mode: 1.2V domain powered off (mode not available on STM32F3x8 devices).

##### Sleep mode

- Entry: The Sleep mode is entered by using the `HAL_PWR_EnterSLEEPMode(PWR_MAINREGULATOR_ON, PWR_SLEEPENTRY_WFx)` functions with
  - `PWR_SLEEPENTRY_WFI`: enter SLEEP mode with WFI instruction
  - `PWR_SLEEPENTRY_WFE`: enter SLEEP mode with WFE instruction
- Exit:

- Any peripheral interrupt acknowledged by the nested vectored interrupt controller (NVIC) can wake up the device from Sleep mode.

### Stop mode

In Stop mode, all clocks in the 1.8V domain are stopped, the PLL, the HSI, and the HSE RC oscillators are disabled. Internal SRAM and register contents are preserved. The voltage regulator can be configured either in normal or low-power mode to minimize the consumption.

- Entry: The Stop mode is entered using the HAL\_PWR\_EnterSTOPMode(PWR\_MAINREGULATOR\_ON, PWR\_STOPENTRY\_WFI ) function with:
  - Main regulator ON or
  - Low Power regulator ON.
  - PWR\_STOPENTRY\_WFI: enter STOP mode with WFI instruction or
  - PWR\_STOPENTRY\_WFE: enter STOP mode with WFE instruction
- Exit:
  - Any EXTI Line (Internal or External) configured in Interrupt/Event mode.
  - Some specific communication peripherals (CEC, USART, I2C) interrupts, when programmed in wakeup mode (the peripheral must be programmed in wakeup mode and the corresponding interrupt vector must be enabled in the NVIC).

### Standby mode

The Standby mode allows to achieve the lowest power consumption. It is based on the Cortex-M4 deep sleep mode, with the voltage regulator disabled. The 1.8V domain is consequently powered off. The PLL, the HSI oscillator and the HSE oscillator are also switched off. SRAM and register contents are lost except for the RTC registers, RTC backup registers, backup SRAM and Standby circuitry. The voltage regulator is OFF.

- Entry:
  - The Standby mode is entered using the HAL\_PWR\_EnterSTANDBYMode() function.
- Exit:
  - WKUP pin rising edge, RTC alarm (Alarm A and Alarm B), RTC wakeup, tamper event, time-stamp event, external reset in NRST pin, IWDG reset.

### Auto-wakeup (AWU) from low-power mode

The MCU can be woken up from low-power mode by an RTC Alarm event, an RTC Wakeup event, a tamper event, a time-stamp event, or a comparator event, without depending on an external interrupt (Auto-wakeup mode).

- RTC auto-wakeup (AWU) from the Stop and Standby modes
  - To wake up from the Stop mode with an RTC alarm event, it is necessary to configure the RTC to generate the RTC alarm using the HAL\_RTC\_SetAlarm\_IT() function.
  - To wake up from the Stop mode with an RTC Tamper or time stamp event, it is necessary to configure the RTC to detect the tamper or time stamp event using the HAL\_RTC\_SetTimeStamp\_IT() or HAL\_RTC\_SetTamper\_IT() functions.
  - To wake up from the Stop mode with an RTC WakeUp event, it is necessary to configure the RTC to generate the RTC WakeUp event using the HAL\_RTC\_SetWakeUpTimer\_IT() function.

- Comparator auto-wakeup (AWU) from the Stop mode
  - To wake up from the Stop mode with a comparator wakeup event, it is necessary to:
    - Configure the EXTI Line associated with the comparator (example EXTI Line 22 for comparator 2U) to be sensitive to the selected edges (falling, rising or falling and rising) (Interrupt or Event modes) using the EXTI\_Init() function.
    - Configure the comparator to generate the event.

|                          | <b>Parameters:</b> <ul style="list-style-type: none"> <li>• <u>_FLAG_</u>: specifies the flag to check. This parameter can be one of the following values:           <ul style="list-style-type: none"> <li>- PWR_FLAG_WU: Wake Up flag. This flag indicates that a wakeup event was received from the WKUP pin or from the RTC alarm (Alarm A or Alarm B), RTC Tamper event, RTC TimeStamp event or RTC Wakeup. An additional wakeup event is detected if the WKUP pin is enabled (by setting the EWUP bit) when the WKUP pin level is already high.</li> <li>- PWR_FLAG_SB: StandBy flag. This flag indicates that the system was resumed from</li> </ul> </li> </ul> |

StandBy mode.

- PWR\_FLAG\_PVDO: PVD Output. This flag is valid only if PVD is enabled by the HAL\_PWR\_EnablePVD() function. The PVD is stopped by Standby mode. For this reason, this bit is equal to 0 after Standby or reset until the PVDE bit is set.
- PWR\_FLAG\_VREFINTRDY: This flag indicates that the internal reference voltage VREFINT is ready.

#### **Return value:**

- The new state of \_\_FLAG\_\_ (TRUE or FALSE).

### \_\_HAL\_PWR\_CLEAR\_FLAG

#### **Description:**

- Clear the PWR's pending flags.

#### **Parameters:**

- \_\_FLAG\_\_: specifies the flag to clear. This parameter can be one of the following values:
  - PWR\_FLAG\_WU: Wake Up flag
  - PWR\_FLAG\_SB: StandBy flag

#### **PWR Flag**

|                     |                                           |
|---------------------|-------------------------------------------|
| PWR_FLAG_WU         | Wakeup event from wakeup pin or RTC alarm |
| PWR_FLAG_SB         | Standby flag                              |
| PWR_FLAG_PVDO       | Power Voltage Detector output flag        |
| PWR_FLAG_VREFINTRDY | VREFINT reference voltage ready           |

#### **PWR Regulator state in STOP mode**

|                          |                                                      |
|--------------------------|------------------------------------------------------|
| PWR_MAINREGULATOR_ON     | Voltage regulator on during STOP mode                |
| PWR_LOWPOWERREGULATOR_ON | Voltage regulator in low-power mode during STOP mode |

#### **PWR SLEEP mode entry**

|                    |                                                       |
|--------------------|-------------------------------------------------------|
| PWR_SLEEPENTRY_WFI | Wait For Interruption instruction to enter SLEEP mode |
| PWR_SLEEPENTRY_WFE | Wait For Event instruction to enter SLEEP mode        |

#### **PWR STOP mode entry**

|                   |                                                      |
|-------------------|------------------------------------------------------|
| PWR_STOPENTRY_WFI | Wait For Interruption instruction to enter STOP mode |
| PWR_STOPENTRY_WFE | Wait For Event instruction to enter STOP mode        |

#### **PWR WakeUp Pins**

|                 |               |
|-----------------|---------------|
| PWR_WAKEUP_PIN1 | Wakeup pin 1U |
| PWR_WAKEUP_PIN2 | Wakeup pin 2U |
| PWR_WAKEUP_PIN3 | Wakeup pin 3U |

## 39 HAL PWR Extension Driver

### 39.1 PWREx Firmware driver registers structures

#### 39.1.1 PWR\_PVDTTypeDef

##### Data Fields

- *uint32\_t PVDLevel*
- *uint32\_t Mode*

##### Field Documentation

- *uint32\_t PWR\_PVDTTypeDef::PVDLevel*

PVDLevel: Specifies the PVD detection level This parameter can be a value of [\*\*PWREx\\_PVD\\_detection\\_level\*\*](#)

- *uint32\_t PWR\_PVDTTypeDef::Mode*

Mode: Specifies the operating mode for the selected pins. This parameter can be a value of [\*\*PWREx\\_PVD\\_Mode\*\*](#)

### 39.2 PWREx Firmware driver API description

#### 39.2.1 Peripheral Extended control functions

##### PVD configuration (present on all other devices than STM32F3x8 devices)

- The PVD is used to monitor the VDD power supply by comparing it to a threshold selected by the PVD Level (PLS[2:0] bits in the PWR\_CR).
- A PVDO flag is available to indicate if VDD/VDDA is higher or lower than the PVD threshold. This event is internally connected to the EXTI line16 and can generate an interrupt if enabled. This is done through `__HAL_PWR_PVD_EXTI_ENABLE_IT()` macro
- The PVD is stopped in Standby mode. PVD is not available on STM32F3x8 Product Line

##### Voltage regulator

- The voltage regulator is always enabled after Reset. It works in three different modes. In Run mode, the regulator supplies full power to the 1.8V domain (core, memories and digital peripherals). In Stop mode, the regulator supplies low power to the 1.8V domain, preserving contents of registers and SRAM. In Stop mode, the regulator is powered off. The contents of the registers and SRAM are lost except for the Standby circuitry and the Backup Domain. Note: in the STM32F3x8xx devices, the voltage regulator is bypassed and the microcontroller must be powered from a nominal VDD = 1.8V +/-8U% voltage.
- A PVDO flag is available to indicate if VDD/VDDA is higher or lower than the PVD threshold. This event is internally connected to the EXTI line16 and can generate an interrupt if enabled. This is done through `__HAL_PWR_PVD_EXTI_ENABLE_IT()` macro
- The PVD is stopped in Standby mode.

### SDADC power configuration

- On STM32F373xC/STM32F378xx devices, there are up to 3 SDADC instances that can be enabled/disabled.

This section contains the following APIs:

- [\*HAL\\_PWR\\_ConfigPVD\(\)\*](#)
- [\*HAL\\_PWR\\_EnablePVD\(\)\*](#)
- [\*HAL\\_PWR\\_DisablePVD\(\)\*](#)
- [\*HAL\\_PWR\\_PVD\\_IRQHandler\(\)\*](#)
- [\*HAL\\_PWR\\_PVDCallback\(\)\*](#)

- Disable the PVD Extended Interrupt Rising Trigger.

**Return value:**

- None.

`__HAL_PWR_PVD_EXTI_DISABLE_FALLING_EDGE`

- Disable the PVD Extended Interrupt Falling Trigger.

**Return value:**

- None.

`__HAL_PWR_PVD_EXTI_DISABLE_RISING_FALLING_EDGE`

**Description:**

- Disable the PVD Extended Interrupt Rising & Falling Trigger.

**Return value:**

- None

`__HAL_PWR_PVD_EXTI_ENABLE_FALLING_EDGE`

**Description:**

- PVD EXTI line configuration: set falling edge trigger.

**Return value:**

- None.

`__HAL_PWR_PVD_EXTI_ENABLE_RISING_EDGE`

**Description:**

- PVD EXTI line configuration: set rising edge trigger.

**Return value:**

- None.

`__HAL_PWR_PVD_EXTI_ENABLE_RISING_FALLING_EDGE`

**Description:**

- Enable the PVD Extended Interrupt Rising & Falling Trigger.

**Return value:**

- None

`__HAL_PWR_PVD_EXTI_GET_FLAG`

**Description:**

- Check whether the specified PVD EXTI interrupt flag is set or not.

**Return value:**

- EXTI: PVD Line Status.

`__HAL_PWR_PVD_EXTI_CLEAR_FLAG`

**Description:**

- Clear the PVD EXTI flag.

**Return value:**

- None.

## 40 HAL RCC Generic Driver

### 40.1 RCC Firmware driver registers structures

#### 40.1.1 RCC\_PLLInitTypeDef

##### Data Fields

- *uint32\_t PLLState*
- *uint32\_t PLLSource*
- *uint32\_t PLLMUL*

##### Field Documentation

- *uint32\_t RCC\_PLLInitTypeDef::PLLState*  
PLLState: The new state of the PLL. This parameter can be a value of [RCC\\_PLL\\_Config](#)
- *uint32\_t RCC\_PLLInitTypeDef::PLLSource*  
PLLSource: PLL entry clock source. This parameter must be a value of [RCC\\_PLL\\_Clock\\_Source](#)
- *uint32\_t RCC\_PLLInitTypeDef::PLLMUL*  
PLLMUL: Multiplication factor for PLL VCO input clock This parameter must be a value of [RCC\\_PLL\\_Multiplication\\_Factor](#)

#### 40.1.2 RCC\_OsclInitTypeDef

##### Data Fields

- *uint32\_t OscillatorType*
- *uint32\_t HSEState*
- *uint32\_t HSEPredivValue*
- *uint32\_t LSEState*
- *uint32\_t HSISState*
- *uint32\_t HSICalibrationValue*
- *uint32\_t LSISState*
- *RCC\_PLLInitTypeDef PLL*

##### Field Documentation

- *uint32\_t RCC\_OsclInitTypeDef::OscillatorType*  
The oscillators to be configured. This parameter can be a value of [RCC\\_Oscillator\\_Type](#)
- *uint32\_t RCC\_OsclInitTypeDef::HSEState*  
The new state of the HSE. This parameter can be a value of [RCC\\_HSE\\_Config](#)
- *uint32\_t RCC\_OsclInitTypeDef::HSEPredivValue*  
The HSE predivision factor value. This parameter can be a value of [RCC\\_PLL\\_HSE\\_Prediv\\_Factor](#)
- *uint32\_t RCC\_OsclInitTypeDef::LSEState*  
The new state of the LSE. This parameter can be a value of [RCC\\_LSE\\_Config](#)
- *uint32\_t RCC\_OsclInitTypeDef::HSISState*  
The new state of the HSI. This parameter can be a value of [RCC\\_HSI\\_Config](#)
- *uint32\_t RCC\_OsclInitTypeDef::HSICalibrationValue*  
The HSI calibration trimming value (default is RCC\_HSICALIBRATION\_DEFAULT).  
This parameter must be a number between Min\_Data = 0x00 and Max\_Data = 0x1FU

- *uint32\_t RCC\_OscInitTypeDef::LSIState*  
The new state of the LSI. This parameter can be a value of [RCC\\_LSI\\_Config](#)
- *RCC\_PLLInitTypeDef RCC\_OscInitTypeDef::PLL*  
PLL structure parameters

### 40.1.3 RCC\_ClkInitTypeDef

#### Data Fields

- *uint32\_t ClockType*
- *uint32\_t SYSCLKSource*
- *uint32\_t AHBCLKDivider*
- *uint32\_t APB1CLKDivider*
- *uint32\_t APB2CLKDivider*

#### Field Documentation

- *uint32\_t RCC\_ClkInitTypeDef::ClockType*  
The clock to be configured. This parameter can be a value of [RCC\\_System\\_Clock\\_Type](#)
- *uint32\_t RCC\_ClkInitTypeDef::SYSCLKSource*  
The clock source (SYSCLK) used as system clock. This parameter can be a value of [RCC\\_System\\_Clock\\_Source](#)
- *uint32\_t RCC\_ClkInitTypeDef::AHBCLKDivider*  
The AHB clock (HCLK) divider. This clock is derived from the system clock (SYSCLK).  
This parameter can be a value of [RCC\\_AHB\\_Clock\\_Source](#)
- *uint32\_t RCC\_ClkInitTypeDef::APB1CLKDivider*  
The APB1 clock (PCLK1) divider. This clock is derived from the AHB clock (HCLK).  
This parameter can be a value of [RCC\\_APB1\\_APB2\\_Clock\\_Source](#)
- *uint32\_t RCC\_ClkInitTypeDef::APB2CLKDivider*  
The APB2 clock (PCLK2) divider. This clock is derived from the AHB clock (HCLK).  
This parameter can be a value of [RCC\\_APB1\\_APB2\\_Clock\\_Source](#)

## 40.2 RCC Firmware driver API description

### 40.2.1 RCC specific features

After reset the device is running from Internal High Speed oscillator (HSI 8MHz) with Flash 0 wait state, Flash prefetch buffer is enabled, and all peripherals are off except internal SRAM, Flash and JTAG.

- There is no prescaler on High speed (AHB) and Low speed (APB) buses; all peripherals mapped on these buses are running at HSI speed.
- The clock for all peripherals is switched off, except the SRAM and FLASH.
- All GPIOs are in input floating state, except the JTAG pins which are assigned to be used for debug purpose.

Once the device started from reset, the user application has to:

- Configure the clock source to be used to drive the System clock (if the application needs higher frequency/performance)
- Configure the System clock frequency and Flash settings
- Configure the AHB and APB buses prescalers
- Enable the clock for the peripheral(s) to be used
- Configure the clock source(s) for peripherals whose clocks are not derived from the System clock (RTC, ADC, I2C, I2S, TIM, USB FS)

## 40.2.2 RCC Limitations

A delay between an RCC peripheral clock enable and the effective peripheral enabling should be taken into account in order to manage the peripheral read/write from/to registers.

- This delay depends on the peripheral mapping.
  - AHB & APB peripherals, 1 dummy read is necessary

Workarounds:

1. For AHB & APB peripherals, a dummy read to the peripheral register has been inserted in each `__HAL_RCC_PPP_CLK_ENABLE()` macro.

## 40.2.3 Initialization and de-initialization functions

This section provides functions allowing to configure the internal/external oscillators (HSE, HSI, LSE, LSI, PLL, CSS and MCO) and the System buses clocks (SYSCLK, AHB, APB1 and APB2).

Internal/external clock and PLL configuration

1. HSI (high-speed internal), 8 MHz factory-trimmed RC used directly or through the PLL as System clock source. The HSI clock can be used also to clock the USART and I2C peripherals.
2. LSI (low-speed internal), ~40 KHz low consumption RC used as IWDG and/or RTC clock source.
3. HSE (high-speed external), 4 to 32 MHz crystal oscillator used directly or through the PLL as System clock source. Can be used also as RTC clock source.
4. LSE (low-speed external), 32 KHz oscillator used as RTC clock source.
5. PLL (clocked by HSI or HSE), featuring different output clocks:
  - The first output is used to generate the high speed system clock (up to 72 MHz)
  - The second output is used to generate the clock for the USB FS (48 MHz)
  - The third output may be used to generate the clock for the ADC peripherals (up to 72 MHz)
  - The fourth output may be used to generate the clock for the TIM peripherals (144 MHz)
6. CSS (Clock security system), once enable using the macro `__HAL_RCC_CSS_ENABLE()` and if a HSE clock failure occurs(HSE used directly or through PLL as System clock source), the System clocks automatically switched to HSI and an interrupt is generated if enabled. The interrupt is linked to the Cortex-M4 NMI (Non-Maskable Interrupt) exception vector.
7. MCO (microcontroller clock output), used to output SYSCLK, HSI, HSE, LSI, LSE or PLL clock (divided by 2) output on pin (such as PA8 pin).

System, AHB and APB buses clocks configuration

1. Several clock sources can be used to drive the System clock (SYSCLK): HSI, HSE and PLL. The AHB clock (HCLK) is derived from System clock through configurable prescaler and used to clock the CPU, memory and peripherals mapped on AHB bus (DMA, GPIO...). APB1 (PCLK1) and APB2 (PCLK2) clocks are derived from AHB clock through configurable prescalers and used to clock the peripherals mapped on these buses. You can use "`@ref HAL_RCC_GetSysClockFreq()`" function to retrieve the frequencies of these clocks.
2. All the peripheral clocks are derived from the System clock (SYSCLK) except:
  - The FLASH program/erase clock which is always HSI 8MHz clock.
  - The USB 48 MHz clock which is derived from the PLL VCO clock.
  - The USART clock which can be derived as well from HSI 8MHz, LSI or LSE.
  - The I2C clock which can be derived as well from HSI 8MHz clock.
  - The ADC clock which is derived from PLL output.

- The RTC clock which is derived from the LSE, LSI or 1 MHz HSE\_RTC (HSE divided by a programmable prescaler). The System clock (SYSCLK) frequency must be higher or equal to the RTC clock frequency.
  - IWDG clock which is always the LSI clock.
3. For the STM32F3xx devices, the maximum frequency of the SYSCLK, HCLK, PCLK1 and PCLK2 is 72 MHz, Depending on the SYSCLK frequency, the flash latency should be adapted accordingly.
  4. After reset, the System clock source is the HSI (8 MHz) with 0 WS and prefetch is disabled.

This section contains the following APIs:

- [\*HAL\\_RCC\\_DelInit\(\)\*](#)
- [\*HAL\\_RCC\\_OscConfig\(\)\*](#)
- [\*HAL\\_RCC\\_ClockConfig\(\)\*](#)

#### 40.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the RCC Clocks frequencies.

This section contains the following APIs:

- [\*HAL\\_RCC\\_MCOConfig\(\)\*](#)
- [\*HAL\\_RCC\\_EnableCSS\(\)\*](#)
- [\*HAL\\_RCC\\_DisableCSS\(\)\*](#)
- [\*HAL\\_RCC\\_GetSysClockFreq\(\)\*](#)
- [\*HAL\\_RCC\\_GetHCLKFreq\(\)\*](#)
- [\*HAL\\_RCC\\_GetPCLK1Freq\(\)\*](#)
- [\*HAL\\_RCC\\_GetPCLK2Freq\(\)\*](#)
- [\*HAL\\_RCC\\_GetOscConfig\(\)\*](#)
- [\*HAL\\_RCC\\_GetClockConfig\(\)\*](#)
- [\*HAL\\_RCC\\_NMI\\_IRQHandler\(\)\*](#)
- [\*HAL\\_RCC\\_CSSCallback\(\)\*](#)

#### 40.2.5 Detailed description of functions

**Flags Interrupts Management**\_\_HAL\_RCC\_ENABLE\_IT**Description:**

- Enable RCC interrupt.

**Parameters:**

- \_\_INTERRUPT\_\_: specifies the RCC interrupt sources to be enabled. This parameter can be any combination of the following values:
  - RCC\_IT\_LSIRDY LSI ready interrupt
  - RCC\_IT\_LSERDY LSE ready interrupt
  - RCC\_IT\_HSIRDY HSI ready interrupt
  - RCC\_IT\_HSERDY HSE ready interrupt
  - RCC\_IT\_PLLRDY main PLL ready interrupt

\_\_HAL\_RCC\_DISABLE\_IT**Description:**

- Disable RCC interrupt.

**Parameters:**

- \_\_INTERRUPT\_\_: specifies the RCC interrupt sources to be disabled. This parameter can be any combination of the following values:
  - RCC\_IT\_LSIRDY LSI ready interrupt

- RCC\_IT\_LSERDY LSE ready interrupt
- RCC\_IT\_HSIRDY HSI ready interrupt
- RCC\_IT\_HSERDY HSE ready interrupt
- RCC\_IT\_PLLRDY main PLL ready interrupt

[\\_\\_HAL\\_RCC\\_CLEAR\\_IT](#)**Description:**

- Clear the RCC's interrupt pending bits.

**Parameters:**

- \_\_INTERRUPT\_\_: specifies the interrupt pending bit to clear. This parameter can be any combination of the following values:
  - RCC\_IT\_LSIRDY LSI ready interrupt.
  - RCC\_IT\_LSERDY LSE ready interrupt.
  - RCC\_IT\_HSIRDY HSI ready interrupt.
  - RCC\_IT\_HSERDY HSE ready interrupt.
  - RCC\_IT\_PLLRDY Main PLL ready interrupt.
  - RCC\_IT\_CSS Clock Security System interrupt

[\\_\\_HAL\\_RCC\\_GET\\_IT](#)**Description:**

- Check the RCC's interrupt has occurred or not.

**Parameters:**

- \_\_INTERRUPT\_\_: specifies the RCC interrupt source to check. This parameter can be one of the following values:
  - RCC\_IT\_LSIRDY LSI ready interrupt.
  - RCC\_IT\_LSERDY LSE ready interrupt.
  - RCC\_IT\_HSIRDY HSI ready interrupt.
  - RCC\_IT\_HSERDY HSE ready interrupt.
  - RCC\_IT\_PLLRDY Main PLL ready interrupt.
  - RCC\_IT\_CSS Clock Security System interrupt

**Return value:**

- The: new state of \_\_INTERRUPT\_\_ (TRUE or FALSE).

[\\_\\_HAL\\_RCC\\_CLEAR\\_RESET\\_FLAGS](#)

The reset flags are RCC\_FLAG\_PINRST, RCC\_FLAG\_PORRST, RCC\_FLAG\_SFTRST, RCC\_FLAG\_OBLRST, RCC\_FLAG\_IWDGRST, RCC\_FLAG\_WWDGRST, RCC\_FLAG\_LPWRRST

[\\_\\_HAL\\_RCC\\_GET\\_FLAG](#)**Description:**

- Check RCC flag is set or not.

**Parameters:**

- \_\_FLAG\_\_: specifies the flag to check. This parameter can be one of the following values:
  - RCC\_FLAG\_HSIRDY HSI oscillator clock ready.
  - RCC\_FLAG\_HSERDY HSE oscillator clock ready.
  - RCC\_FLAG\_PLLRDY Main PLL clock ready.
  - RCC\_FLAG\_LSERDY LSE oscillator clock ready.
  - RCC\_FLAG\_LSIRDY LSI oscillator clock ready.
  - RCC\_FLAG\_OBLRST Option Byte Load reset
  - RCC\_FLAG\_PINRST Pin reset.
  - RCC\_FLAG\_PORRST POR/PDR reset.
  - RCC\_FLAG\_SFTRST Software reset.
  - RCC\_FLAG\_IWDGRST Independent Watchdog reset.
  - RCC\_FLAG\_WWDGRST Window Watchdog reset.
  - RCC\_FLAG\_LPWRRST Low Power reset.

**Return value:**

- The new state of \_\_FLAG\_\_ (TRUE or FALSE).

**Get Clock source**\_HAL\_RCC\_SYSCLK\_CONFIG**Description:**

- Macro to configure the system clock source.

**Parameters:**

- \_\_SYSCLKSOURCE\_\_: specifies the system clock source. This parameter can be one of the following values:
  - RCC\_SYSCLKSOURCE\_HSI HSI oscillator is used as system clock source.
  - RCC\_SYSCLKSOURCE\_HSE HSE oscillator is used as system clock source.
  - RCC\_SYSCLKSOURCE\_PLLCLK PLL output is used as system clock source.

\_HAL\_RCC\_GET\_SYSCLK\_SOURCE**Description:**

- Macro to get the clock source used as system clock.

**Return value:**

- The clock source used as system clock. The returned value can be one of the following:
  - RCC\_SYSCLKSOURCE\_STATUS\_HSI HSI

- used as system clock
- RCC\_SYSCLKSOURCE\_STATUS\_HSE HSE used as system clock
- RCC\_SYSCLKSOURCE\_STATUS\_PLLCLK PLL used as system clock

#### **HSE Config**

|                |                                     |
|----------------|-------------------------------------|
| RCC_HSE_OFF    | HSE clock deactivation              |
| RCC_HSE_ON     | HSE clock activation                |
| RCC_HSE_BYPASS | External clock source for HSE clock |

#### **HSE Configuration**

##### \_\_HAL\_RCC\_HSE\_CONFIG    **Description:**

- Macro to configure the External High Speed oscillator (HSE).

##### **Parameters:**

- \_\_STATE\_\_: specifies the new state of the HSE. This parameter can be one of the following values:
  - RCC\_HSE\_OFF turn OFF the HSE oscillator, HSERDY flag goes low after 6 HSE oscillator clock cycles.
  - RCC\_HSE\_ON turn ON the HSE oscillator
  - RCC\_HSE\_BYPASS HSE oscillator bypassed with external clock

##### **Notes:**

- Transition HSE Bypass to HSE On and HSE On to HSE Bypass are not supported by this macro. User should request a transition to HSE Off first and then HSE On or HSE Bypass. After enabling the HSE (RCC\_HSE\_ON or RCC\_HSE\_Bypass), the application software should wait on HSERDY flag to be set indicating that HSE clock is stable and can be used to clock the PLL and/or system clock. HSE state can not be changed if it is used directly or through the PLL as system clock. In this case, you have to select another source of the system clock then change the HSE state (ex. disable it). The HSE is stopped by hardware when entering STOP and STANDBY modes. This function reset the CSSON bit, so if the clock security system(CSS) was previously enabled you have to enable it again after calling this function.

#### **HSI Config**

|                                   |                        |
|-----------------------------------|------------------------|
| RCC_HSI_OFF                       | HSI clock deactivation |
| RCC_HSI_ON                        | HSI clock activation   |
| <b>RCC_HSICALIBRATION_DEFAULT</b> |                        |

#### **HSI Configuration**

##### \_\_HAL\_RCC\_HSI\_ENABLE

##### **Notes:**

- The HSI is stopped by hardware when

entering STOP and STANDBY modes. It is used (enabled by hardware) as system clock source after startup from Reset, wakeup from STOP and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the Clock Security System CSS is enabled). HSI can not be stopped if it is used as system clock source. In this case, you have to select another source of the system clock then stop the HSI. After enabling the HSI, the application software should wait on HSIRDY flag to be set indicating that HSI clock is stable and can be used as system clock source. When the HSI is stopped, HSIRDY flag goes low after 6 HSI oscillator clock cycles.

`_HAL_RCC_HSI_DISABLE`  
`_HAL_RCC_HSI_CALIBRATION`  
`VALUE_ADJUST`

#### Description:

- Macro to adjust the Internal High Speed oscillator (HSI) calibration value.

#### Parameters:

- `_HSICALIBRATIONVALUE_`: specifies the calibration trimming value. (default is `RCC_HSICALIBRATION_DEFAULT`). This parameter must be a number between 0 and 0x1F.

#### Notes:

- The calibration is used to compensate for the variations in voltage and temperature that influence the frequency of the internal HSI RC.

#### *RCC I2C1 Clock Source*

`RCC_I2C1CLKSOURCE_HSI`  
`RCC_I2C1CLKSOURCE_SYSCLK`

#### *RCC I2Cx Clock Config*

`_HAL_RCC_I2C1_CONFIG`

#### Description:

- Macro to configure the I2C1 clock (I2C1CLK).

#### Parameters:

- `_I2C1CLKSOURCE_`: specifies the I2C1 clock source. This parameter can be one of the following values:
  - `RCC_I2C1CLKSOURCE_HSI` HSI selected as I2C1 clock
  - `RCC_I2C1CLKSOURCE_SYSCLK`

System Clock selected as I2C1 clock

**\_\_HAL\_RCC\_GET\_I2C1\_SOURCE    Description:**

- Macro to get the I2C1 clock source.

**Return value:**

- The: clock source can be one of the following values:
  - RCC\_I2C1CLKSOURCE\_HSI HSI selected as I2C1 clock
  - RCC\_I2C1CLKSOURCE\_SYSCLK System Clock selected as I2C1 clock

**Interrupts**

|               |                                      |
|---------------|--------------------------------------|
| RCC_IT_LSIRDY | LSI Ready Interrupt flag             |
| RCC_IT_LSERDY | LSE Ready Interrupt flag             |
| RCC_IT_HSIRDY | HSI Ready Interrupt flag             |
| RCC_IT_HSERDY | HSE Ready Interrupt flag             |
| RCC_IT_PLLRDY | PLL Ready Interrupt flag             |
| RCC_IT_CSS    | Clock Security System Interrupt flag |

**LSE Config**

|                |                                     |
|----------------|-------------------------------------|
| RCC_LSE_OFF    | LSE clock deactivation              |
| RCC_LSE_ON     | LSE clock activation                |
| RCC_LSE_BYPASS | External clock source for LSE clock |

**LSE Configuration**

**\_\_HAL\_RCC\_LSE\_CONFIG    Description:**

- Macro to configure the External Low Speed oscillator (LSE).

**Parameters:**

- \_\_STATE\_\_: specifies the new state of the LSE. This parameter can be one of the following values:
  - RCC\_LSE\_OFF turn OFF the LSE oscillator, LSERDY flag goes low after 6 LSE oscillator clock cycles.
  - RCC\_LSE\_ON turn ON the LSE oscillator.
  - RCC\_LSE\_BYPASS LSE oscillator bypassed with external clock.

**Notes:**

- Transitions LSE Bypass to LSE On and LSE On to LSE Bypass are not supported by this macro. As the LSE is in the Backup domain and write access is denied to this domain after reset, you have to enable write access using HAL\_PWR\_EnableBkUpAccess() function before to configure the LSE (to be done once after reset). After enabling the LSE (RCC\_LSE\_ON or RCC\_LSE\_BYPASS), the application software should

wait on LSERDY flag to be set indicating that LSE clock is stable and can be used to clock the RTC.

#### ***LSI Config***

|             |                        |
|-------------|------------------------|
| RCC_LSI_OFF | LSI clock deactivation |
| RCC_LSI_ON  | LSI clock activation   |

#### ***LSI Configuration***

|                      |               |
|----------------------|---------------|
| __HAL_RCC_LSI_ENABLE | <b>Notes:</b> |
|----------------------|---------------|

- After enabling the LSI, the application software should wait on LSIRDY flag to be set indicating that LSI clock is stable and can be used to clock the IWDG and/or the RTC.

|                       |               |
|-----------------------|---------------|
| __HAL_RCC_LSI_DISABLE | <b>Notes:</b> |
|-----------------------|---------------|

- LSI can not be disabled if the IWDG is running. When the LSI is stopped, LSIRDY flag goes low after 6 LSI oscillator clock cycles.

#### ***MCO Index***

|          |                                                      |
|----------|------------------------------------------------------|
| RCC_MCO1 |                                                      |
| RCC_MCO  | MCO1 to be compliant with other families with 2 MCOs |

#### ***Oscillator Type***

|                         |  |
|-------------------------|--|
| RCC_OSCILLATORTYPE_NONE |  |
| RCC_OSCILLATORTYPE_HSE  |  |
| RCC_OSCILLATORTYPE_HSI  |  |
| RCC_OSCILLATORTYPE_LSE  |  |
| RCC_OSCILLATORTYPE_LSI  |  |

#### ***PLL Clock Source***

|                   |                                                           |
|-------------------|-----------------------------------------------------------|
| RCC_PLLSOURCE_HSI | HSI clock divided by 2 selected as PLL entry clock source |
| RCC_PLLSOURCE_HSE | HSE clock selected as PLL entry clock source              |

#### ***PLL Config***

|              |                       |
|--------------|-----------------------|
| RCC_PLL_NONE | PLL is not configured |
| RCC_PLL_OFF  | PLL deactivation      |
| RCC_PLL_ON   | PLL activation        |

***PLL Configuration***`_HAL_RCC_PLL_ENABLE`**Notes:**

- After enabling the main PLL, the application software should wait on PLLRDY flag to be set indicating that PLL clock is stable and can be used as system clock source. The main PLL is disabled by hardware when entering STOP and STANDBY modes.

`_HAL_RCC_PLL_DISABLE`**Notes:**

- The main PLL can not be disabled if it is used as system clock source

`_HAL_RCC_GET_PLL_OSCSOURCE`**Description:**

- Get oscillator clock selected as PLL input clock.

**Return value:**

- The: clock source used for PLL entry. The returned value can be one of the following:
  - RCC\_PLLSOURCE\_HSI HSI oscillator clock selected as PLL input clock
  - RCC\_PLLSOURCE\_HSE HSE oscillator clock selected as PLL input clock

**RCC RTC Clock Configuration**

`__HAL_RCC_RTC_CONFIG`

**Description:**

- Macro to configure the RTC clock (RTCCLK).

**Parameters:**

- `__RTC_CLKSOURCE__`: specifies the RTC clock source. This parameter can be one of the following values:
  - `RCC_RTCCLKSOURCE_NO_CLK` No clock selected as RTC clock
  - `RCC_RTCCLKSOURCE_LSE` LSE selected as RTC clock
  - `RCC_RTCCLKSOURCE_LSI` LSI selected as RTC clock
  - `RCC_RTCCLKSOURCE_HSE_DIV32` HSE clock divided by 32

**Notes:**

- As the RTC clock configuration bits are in the Backup domain and write access is denied to this domain after reset, you have to enable write access using the Power Backup Access macro before to configure the RTC clock source (to be done once after reset). Once the RTC clock is configured it cannot be changed unless the Backup domain is reset using `__HAL_RCC_BACKUPRESET_FORCE()` macro, or by a Power On Reset (POR).
- If the LSE or LSI is used as RTC clock source, the RTC continues to work in STOP and STANDBY modes, and can be used as wakeup source. However, when the LSI clock and HSE clock divided by 32 is used as RTC clock source, the RTC cannot be used in STOP and STANDBY modes. The system must always be configured so as to get a PCLK frequency greater than or equal to the RTCCLK frequency for a proper operation of the RTC.

#### `__HAL_RCC_GET_RTC_SOURCE`

##### **Description:**

- Macro to get the RTC clock source.

##### **Return value:**

- The clock source can be one of the following values:
  - `RCC_RTCCLKSOURCE_NO_CLK` No clock selected as RTC clock
  - `RCC_RTCCLKSOURCE_LSE` LSE selected as RTC clock
  - `RCC_RTCCLKSOURCE_LSI` LSI selected as RTC clock
  - `RCC_RTCCLKSOURCE_HSE_DIV32` HSE clock divided by 32

#### `__HAL_RCC_RTC_ENABLE`

##### **Notes:**

- These macros must be used only after the RTC clock source was selected.

#### `__HAL_RCC_RTC_DISABLE`

##### **Notes:**

- These macros must be used only after the RTC clock source was selected.

#### `__HAL_RCC_BACKUPRESET_FORCE`

##### **Notes:**

- This function resets the RTC peripheral (including the backup registers) and the RTC clock source selection in `RCC_BDCR` register.

---

RCC\_USART3CLKSOURCE\_HSI

### **RCC USARTx Clock Config**

\_\_HAL\_RCC\_USART1\_CONFIG **Description:**

- Macro to configure the USART1 clock (USART1CLK).

#### **Parameters:**

- \_\_USART1CLKSOURCE\_\_: specifies the USART1 clock source. This parameter can be one of the following values:
  - RCC\_USART1CLKSOURCE\_PCLK2 PCLK2 selected as USART1 clock
  - RCC\_USART1CLKSOURCE\_HSI HSI selected as USART1 clock
  - RCC\_USART1CLKSOURCE\_SYSCLK System Clock selected as USART1 clock
  - RCC\_USART1CLKSOURCE\_LSE LSE selected as USART1 clock

\_\_HAL\_RCC\_GET\_USART1\_SOURCE

#### **Description:**

- Macro to get the USART1 clock source.

#### **Return value:**

- The clock source can be one of the following values:
  - RCC\_USART1CLKSOURCE\_PCLK2 PCLK2 selected as USART1 clock
  - RCC\_USART1CLKSOURCE\_HSI HSI selected as USART1 clock
  - RCC\_USART1CLKSOURCE\_SYSCLK System Clock selected as USART1 clock
  - RCC\_USART1CLKSOURCE\_LSE LSE selected as USART1 clock

\_\_HAL\_RCC\_USART2\_CONFIG

#### **Description:**

- Macro to configure the USART2 clock (USART2CLK).

#### **Parameters:**

- \_\_USART2CLKSOURCE\_\_: specifies the USART2 clock source. This parameter can be one of the following values:
  - RCC\_USART2CLKSOURCE\_PCLK1 PCLK1 selected as USART2 clock
  - RCC\_USART2CLKSOURCE\_HSI HSI selected as USART2 clock
  - RCC\_USART2CLKSOURCE\_SYSCLK System Clock selected as USART2 clock
  - RCC\_USART2CLKSOURCE\_LSE LSE selected as USART2 clock

`__HAL_RCC_GET_USART2_SOURCE`

**Description:**

- Macro to get the USART2 clock source.

**Return value:**

- The: clock source can be one of the following values:
  - `RCC_USART2CLKSOURCE_PCLK1` PCLK1 selected as USART2 clock
  - `RCC_USART2CLKSOURCE_HSI` HSI selected as USART2 clock
  - `RCC_USART2CLKSOURCE_SYSCLK` System Clock selected as USART2 clock
  - `RCC_USART2CLKSOURCE_LSE` LSE selected as USART2 clock

`__HAL_RCC_USART3_CONFIG`

**Description:**

- Macro to configure the USART3 clock (USART3CLK).

**Parameters:**

- `__USART3CLKSOURCE__`: specifies the USART3 clock source. This parameter can be one of the following values:
  - `RCC_USART3CLKSOURCE_PCLK1` PCLK1 selected as USART3 clock
  - `RCC_USART3CLKSOURCE_HSI` HSI selected as USART3 clock
  - `RCC_USART3CLKSOURCE_SYSCLK` System Clock selected as USART3 clock
  - `RCC_USART3CLKSOURCE_LSE` LSE selected as USART3 clock

`__HAL_RCC_GET_USART3_SOURCE`

**Description:**

- Macro to get the USART3 clock source.

**Return value:**

- The: clock source can be one of the following values:
  - `RCC_USART3CLKSOURCE_PCLK1` PCLK1 selected as USART3 clock
  - `RCC_USART3CLKSOURCE_HSI` HSI selected as USART3 clock
  - `RCC_USART3CLKSOURCE_SYSCLK` System Clock selected as USART3 clock
  - `RCC_USART3CLKSOURCE_LSE` LSE selected as USART3 clock

USB clock source This parameter can be a value of `RCCEEx_USB_Clock_Source`

## 41.2 RCCEEx Firmware driver API description

### 41.2.1 Extended Peripheral Control functions

This subsection provides a set of functions allowing to control the RCC Clocks frequencies.

Important note: Care must be taken when `HAL_RCCEEx_PeriphCLKConfig()` is used to select the RTC clock source; in this case the Backup domain will be reset in order to modify the RTC Clock source, as consequence RTC registers (including the backup registers) are set to their reset values.

This section contains the following APIs:

- `HAL_RCCEEx_PeriphCLKConfig()`
- `HAL_RCCEEx_GetPeriphCLKConfig()`
- `HAL_RCCEEx_GetPeriphCLKFreq()`

### 41.2.2 Detailed description of functions

#### `HAL_RCCEEx_PeriphCLKConfig`

|                      |                                                                                                                                                                                                                                                                                                                                                                                     |

\_HAL\_RCC\_ADC12\_CONFIG

**Description:**

- Macro to configure the ADC1 & ADC2 clock (ADC12CLK).

**Parameters:**

- \_ADC12CLKSource\_: specifies the ADC1 & ADC2 clock source. This parameter can be one of the following values:
  - RCC\_ADC12PLLCLK\_OFF ADC1 & ADC2 PLL clock disabled, ADC1 & ADC2 can use AHB clock
  - RCC\_ADC12PLLCLK\_DIV1 PLL clock divided by 1 selected as ADC1 & ADC2 clock
  - RCC\_ADC12PLLCLK\_DIV2 PLL clock divided by 2 selected as ADC1 & ADC2 clock
  - RCC\_ADC12PLLCLK\_DIV4 PLL clock divided by 4 selected as ADC1 & ADC2 clock

- RCC\_ADC12PLLCLK\_DIV6 PLL clock divided by 6 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV8 PLL clock divided by 8 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV10 PLL clock divided by 10 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV12 PLL clock divided by 12 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV16 PLL clock divided by 16 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV32 PLL clock divided by 32 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV64 PLL clock divided by 64 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV128 PLL clock divided by 128 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV256 PLL clock divided by 256 selected as ADC1 & ADC2 clock

[\\_\\_HAL\\_RCC\\_GET\\_ADC12\\_SOURCE](#) **Description:**

- Macro to get the ADC1 & ADC2 clock.

**Return value:**

- The: clock source can be one of the following values:
  - RCC\_ADC12PLLCLK\_OFF ADC1 & ADC2 PLL clock disabled, ADC1 & ADC2 can use AHB clock
  - RCC\_ADC12PLLCLK\_DIV1 PLL clock divided by 1 selected as ADC1 & ADC2 clock
  - RCC\_ADC12PLLCLK\_DIV2 PLL clock divided by 2 selected as ADC1 & ADC2 clock
  - RCC\_ADC12PLLCLK\_DIV4 PLL clock divided by 4 selected as ADC1 & ADC2 clock
  - RCC\_ADC12PLLCLK\_DIV6 PLL clock divided by 6 selected as ADC1 & ADC2 clock
  - RCC\_ADC12PLLCLK\_DIV8 PLL clock divided by 8 selected as ADC1 & ADC2 clock
  - RCC\_ADC12PLLCLK\_DIV10 PLL clock divided by 10 selected as ADC1 &

- ADC2 clock
- RCC\_ADC12PLLCLK\_DIV12 PLL clock divided by 12 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV16 PLL clock divided by 16 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV32 PLL clock divided by 32 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV64 PLL clock divided by 64 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV128 PLL clock divided by 128 selected as ADC1 & ADC2 clock
- RCC\_ADC12PLLCLK\_DIV256 PLL clock divided by 256 selected as ADC1 & ADC2 clock

[\\_\\_HAL\\_RCC\\_ADC34\\_CONFIG](#)**Description:**

- Macro to configure the ADC3 & ADC4 clock (ADC34CLK).

**Parameters:**

- \_\_ADC34CLKSource\_\_: specifies the ADC3 & ADC4 clock source. This parameter can be one of the following values:
  - RCC\_ADC34PLLCLK\_OFF ADC3 & ADC4 PLL clock disabled, ADC3 & ADC4 can use AHB clock
  - RCC\_ADC34PLLCLK\_DIV1 PLL clock divided by 1 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV2 PLL clock divided by 2 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV4 PLL clock divided by 4 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV6 PLL clock divided by 6 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV8 PLL clock divided by 8 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV10 PLL clock divided by 10 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV12 PLL clock divided by 12 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV16 PLL clock divided by 16 selected as ADC3 &

- ADC4 clock
- RCC\_ADC34PLLCLK\_DIV32 PLL clock divided by 32 selected as ADC3 & ADC4 clock
- RCC\_ADC34PLLCLK\_DIV64 PLL clock divided by 64 selected as ADC3 & ADC4 clock
- RCC\_ADC34PLLCLK\_DIV128 PLL clock divided by 128 selected as ADC3 & ADC4 clock
- RCC\_ADC34PLLCLK\_DIV256 PLL clock divided by 256 selected as ADC3 & ADC4 clock

**\_HAL\_RCC\_GET\_ADC34\_SOURCE****Description:**

- Macro to get the ADC3 & ADC4 clock.

**Return value:**

- The: clock source can be one of the following values:
  - RCC\_ADC34PLLCLK\_OFF ADC3 & ADC4 PLL clock disabled, ADC3 & ADC4 can use AHB clock
  - RCC\_ADC34PLLCLK\_DIV1 PLL clock divided by 1 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV2 PLL clock divided by 2 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV4 PLL clock divided by 4 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV6 PLL clock divided by 6 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV8 PLL clock divided by 8 selected as ADC3 & ADC4 clock
  - RCC\_ADC34PLLCLK\_DIV10 PLL clock divided by 10 selected as ADC3 & ADC4 clock

| <ul style="list-style-type: none"> <li>Macro to configure the External High Speed oscillator (HSE) Predivision factor for PLL.</li> </ul> |                     |

**Parameters:**

- `_HSE_PREDIV_VALUE_`: specifies the division value applied to HSE. This parameter must be a number between `RCC_HSE_PREDIV_DIV1` and `RCC_HSE_PREDIV_DIV16`.

**Notes:**

- Predivision factor can not be changed if PLL is used as system clock In this case, you have to select another source of the system clock, disable the PLL and then change the HSE predivision factor.

**Parameters:**

- `_I2C2CLKSource_`: specifies the I2C2 clock source. This parameter can be one of the following values:
  - `RCC_I2C2CLKSOURCE_HSI` HSI selected as I2C2 clock

- RCC\_I2C2CLKSOURCE\_SYSCLK  
System Clock selected as I2C2 clock

**\_HAL\_RCC\_GET\_I2C2\_SOURCE** **Description:**

- Macro to get the I2C2 clock source.

**Return value:**

- The: clock source can be one of the following values:
  - RCC\_I2C2CLKSOURCE\_HSI HSI selected as I2C2 clock
  - RCC\_I2C2CLKSOURCE\_SYSCLK System Clock selected as I2C2 clock

***RCC Extended I2Sx Clock Config***

**\_HAL\_RCC\_I2S\_CONFIG**

**Description:**

- Macro to configure the I2S clock source (I2SCLK).

**Parameters:**

- I2SCLKSource: specifies the I2S clock source. This parameter can be one of the following values:
  - RCC\_I2SCLKSOURCE\_SYSCLK SYSCLK clock used as I2S clock source
  - RCC\_I2SCLKSOURCE\_EXT External clock mapped on the I2S\_CKIN pin used as I2S clock source

**Notes:**

- This function must be called before enabling the I2S APB clock.

**\_HAL\_RCC\_GET\_I2S\_SOURCE**

**Description:**

- Macro to get the I2S clock source (I2SCLK).

**Return value:**

- The: clock source can be one of the following values:
  - RCC\_I2SCLKSOURCE\_SYSCLK SYSCLK clock used as I2S clock source
  - RCC\_I2SCLKSOURCE\_EXT External clock mapped on the I2S\_CKIN pin used as I2S clock source

**LSE Drive Configuration****\_HAL\_RCC\_LSEDRIVE\_CONFIG** **Description:**

- Macro to configure the External Low Speed oscillator (LSE) drive capability.

**Parameters:**

- `_RCC_LSEDRIVE_`: specifies the new state of the LSE drive capability. This parameter can be one of the following values:
  - `RCC_LSEDRIVE_LOW` LSE oscillator low drive capability.
  - `RCC_LSEDRIVE_MEDIUMLOW` LSE oscillator medium low drive capability.
  - `RCC_LSEDRIVE_MEDIUMHIGH` LSE oscillator medium high drive capability.
  - `RCC_LSEDRIVE_HIGH` LSE oscillator high drive capability.

**Return value:**

- None

***RCC Extended MCOx Clock Config*****\_HAL\_RCC\_MCO1\_CONFIG** **Description:**

- Macro to configure the MCO clock.

**Parameters:**

- `_MCOCLKSOURCE_`: specifies the MCO clock source. This parameter can be one of the following values:
  - `RCC_MCO1SOURCE_NOCLOCK` No clock selected as MCO clock
  - `RCC_MCO1SOURCE_SYSCLK` System Clock selected as MCO clock
  - `RCC_MCO1SOURCE_HSI` HSI selected as MCO clock
  - `RCC_MCO1SOURCE_HSE` HSE selected as MCO clock
  - `RCC_MCO1SOURCE_LSI` LSI selected as MCO clock
  - `RCC_MCO1SOURCE_LSE` LSE selected as MCO clock
  - `RCC_MCO1SOURCE_PLLCLK_DIV2` PLLCLK Divided by 2 selected as MCO clock

- Macro to configure the PLL clock source and multiplication factor.

**Parameters:**

- \_RCC\_PLLSource: specifies the PLL entry clock source. This parameter can be one of the following values:
  - `RCC_PLLSOURCE_HSI` HSI oscillator clock selected as PLL clock entry
  - `RCC_PLLSOURCE_HSE` HSE oscillator clock selected as PLL clock entry
- \_PLLMUL: specifies the multiplication factor for PLL VCO input clock. This parameter must be a number between `RCC_PLL_MUL2` and `RCC_PLL_MUL16`.

**Notes:**

- This macro must be used only when the PLL is disabled.

**RCC Extended TIM1 Clock Source**`RCC_TIM1CLK_HCLK``RCC_TIM1CLK_PLLCLK`**RCC Extended TIM8 Clock Source**`RCC_TIM8CLK_HCLK``RCC_TIM8CLK_PLLCLK`**RCC Extended TIMx Clock Config**`_HAL_RCC_TIM1_CONFIG`**Description:**

- Macro to configure the TIM1 clock (TIM1CLK).

**Parameters:**

- `_TIM1CLKSource_`: specifies the TIM1 clock source. This parameter can be one of the following values:
  - `RCC_TIM1CLK_HCLK` HCLK selected as TIM1 clock
  - `RCC_TIM1CLK_PLLCLK` PLL Clock selected as TIM1 clock

`_HAL_RCC_GET_TIM1_SOURCE`**Description:**

- Macro to get the TIM1 clock (TIM1CLK).

**Return value:**

- The: clock source can be one of the following values:
  - `RCC_TIM1CLK_HCLK` HCLK selected as TIM1 clock
  - `RCC_TIM1CLK_PLLCLK` PLL Clock selected as TIM1 clock

`_HAL_RCC_TIM8_CONFIG`**Description:**

- Macro to configure the TIM8 clock (TIM8CLK).

**Parameters:**

- `_TIM8CLKSource_`: specifies the TIM8 clock source. This parameter can be one of the following values:
  - `RCC_TIM8CLK_HCLK` HCLK selected as TIM8 clock
  - `RCC_TIM8CLK_PLLCLK` PLL Clock selected as TIM8 clock

`_HAL_RCC_GET_TIM8_SOURCE`**Description:**

- Macro to get the TIM8 clock (TIM8CLK).

**Return value:**

- The clock source can be one of the following values:
  - RCC\_TIM8CLK\_HCLK HCLK selected as TIM8 clock
  - RCC\_TIM8CLK\_PLLCLK PLL Clock selected as TIM8 clock

## 42 HAL RTC Generic Driver

### 42.1 RTC Firmware driver registers structures

#### 42.1.1 RTC\_InitTypeDef

##### Data Fields

- *uint32\_t HourFormat*
- *uint32\_t AsynchPrediv*
- *uint32\_t SynchPrediv*
- *uint32\_t OutPut*
- *uint32\_t OutPutPolarity*
- *uint32\_t OutPutType*

##### Field Documentation

- *uint32\_t RTC\_InitTypeDef::HourFormat*  
Specifies the RTC Hour Format. This parameter can be a value of [\*RTC\\_Hour\\_Formats\*](#)
- *uint32\_t RTC\_InitTypeDef::AsynchPrediv*  
Specifies the RTC Asynchronous Predivider value. This parameter must be a number between Min\_Data = 0x00 and Max\_Data = 0x7F
- *uint32\_t RTC\_InitTypeDef::SynchPrediv*  
Specifies the RTC Synchronous Predivider value. This parameter must be a number between Min\_Data = 0x00 and Max\_Data = 0x7FFF
- *uint32\_t RTC\_InitTypeDef::OutPut*  
Specifies which signal will be routed to the RTC output. This parameter can be a value of [\*RTCEx\\_Output\\_selection\\_Definitions\*](#)
- *uint32\_t RTC\_InitTypeDef::OutPutPolarity*  
Specifies the polarity of the output signal. This parameter can be a value of [\*RTC\\_Output\\_Polarity\\_Definitions\*](#)
- *uint32\_t RTC\_InitTypeDef::OutPutType*  
Specifies the RTC Output Pin mode. This parameter can be a value of [\*RTC\\_Output\\_Type\\_ALARM\\_OUT\*](#)

#### 42.1.2 RTC\_TimeTypeDef

##### Data Fields

- *uint8\_t Hours*
- *uint8\_t Minutes*
- *uint8\_t Seconds*
- *uint8\_t TimeFormat*
- *uint32\_t SubSeconds*
- *uint32\_t SecondFraction*
- *uint32\_t DayLightSaving*
- *uint32\_t StoreOperation*

##### Field Documentation

- *uint8\_t RTC\_TimeTypeDef::Hours*  
Specifies the RTC Time Hour. This parameter must be a number between Min\_Data = 0 and Max\_Data = 12 if the RTC\_HourFormat\_12 is selected. This parameter must be

- a number between Min\_Data = 0 and Max\_Data = 23 if the RTC\_HourFormat\_24 is selected
- ***uint8\_t RTC\_TimeTypeDef::Minutes***  
Specifies the RTC Time Minutes. This parameter must be a number between Min\_Data = 0 and Max\_Data = 59
  - ***uint8\_t RTC\_TimeTypeDef::Seconds***  
Specifies the RTC Time Seconds. This parameter must be a number between Min\_Data = 0 and Max\_Data = 59
  - ***uint8\_t RTC\_TimeTypeDef::TimeFormat***  
Specifies the RTC AM/PM Time. This parameter can be a value of [RTC\\_AM\\_PM\\_Definitions](#)
  - ***uint32\_t RTC\_TimeTypeDef::SubSeconds***  
Specifies the RTC\_SSR RTC Sub Second register content. This parameter corresponds to a time unit range between [0-1] Second with [1 Sec / SecondFraction +1] granularity
  - ***uint32\_t RTC\_TimeTypeDef::SecondFraction***  
Specifies the range or granularity of Sub Second register content corresponding to Synchronous pre-scaler factor value (PREDIV\_S) This parameter corresponds to a time unit range between [0-1] Second with [1 Sec / SecondFraction +1] granularity. This field will be used only by HAL\_RTC\_GetTime function
  - ***uint32\_t RTC\_TimeTypeDef::DayLightSaving***  
Specifies RTC\_DayLightSaveOperation: the value of hour adjustment. This parameter can be a value of [RTC\\_DayLightSaving\\_Definitions](#)
  - ***uint32\_t RTC\_TimeTypeDef::StoreOperation***  
Specifies RTC\_StoreOperation value to be written in the BCK bit in CR register to store the operation. This parameter can be a value of [RTC\\_StoreOperation\\_Definitions](#)

#### 42.1.3 RTC\_DateTypeDef

##### Data Fields

- ***uint8\_t WeekDay***
- ***uint8\_t Month***
- ***uint8\_t Date***
- ***uint8\_t Year***

##### Field Documentation

- ***uint8\_t RTC\_DateTypeDef::WeekDay***  
Specifies the RTC Date WeekDay. This parameter can be a value of [RTC\\_WeekDay\\_Definitions](#)
- ***uint8\_t RTC\_DateTypeDef::Month***  
Specifies the RTC Date Month (in BCD format). This parameter can be a value of [RTC\\_Month\\_Date\\_Definitions](#)
- ***uint8\_t RTC\_DateTypeDef::Date***  
Specifies the RTC Date. This parameter must be a number between Min\_Data = 1 and Max\_Data = 31
- ***uint8\_t RTC\_DateTypeDef::Year***  
Specifies the RTC Date Year. This parameter must be a number between Min\_Data = 0 and Max\_Data = 99

#### 42.1.4 RTC\_AlarmTypeDef

##### Data Fields

- ***RTC\_TimeTypeDef AlarmTime***

- *uint32\_t AlarmMask*
- *uint32\_t AlarmSubSecondMask*
- *uint32\_t AlarmDateWeekDaySel*
- *uint8\_t AlarmDateWeekDay*
- *uint32\_t Alarm*

#### Field Documentation

- ***RTC\_TimeTypeDef RTC\_AlarmTypeDef::AlarmTime***  
Specifies the RTC Alarm Time members
- ***uint32\_t RTC\_AlarmTypeDef::AlarmMask***  
Specifies the RTC Alarm Masks. This parameter can be a value of [\*RTC\\_AlarmMask\\_Definitions\*](#)
- ***uint32\_t RTC\_AlarmTypeDef::AlarmSubSecondMask***  
Specifies the RTC Alarm SubSeconds Masks. This parameter can be a value of [\*RTC\\_Alarm\\_Sub\\_Seconds\\_Masks\\_Definitions\*](#)
- ***uint32\_t RTC\_AlarmTypeDef::AlarmDateWeekDaySel***  
Specifies the RTC Alarm is on Date or WeekDay. This parameter can be a value of [\*RTC\\_AlarmDateWeekDay\\_Definitions\*](#)
- ***uint8\_t RTC\_AlarmTypeDef::AlarmDateWeekDay***  
Specifies the RTC Alarm Date/WeekDay. If the Alarm Date is selected, this parameter must be set to a value in the 1-31 range. If the Alarm WeekDay is selected, this parameter can be a value of [\*RTC\\_WeekDay\\_Definitions\*](#)
- ***uint32\_t RTC\_AlarmTypeDef::Alarm***  
Specifies the alarm . This parameter can be a value of [\*RTC\\_Alarms\\_Definitions\*](#)

### 42.1.5 RTC\_HandleTypeDef

#### Data Fields

- *RTC\_TypeDef \* Instance*
- *RTC\_InitTypeDef Init*
- *HAL\_LockTypeDef Lock*
- *\_\_IO HAL\_RTCStateTypeDef State*

#### Field Documentation

- ***RTC\_TypeDef\* RTC\_HandleTypeDef::Instance***  
Register base address
- ***RTC\_InitTypeDef RTC\_HandleTypeDef::Init***  
RTC required parameters
- ***HAL\_LockTypeDef RTC\_HandleTypeDef::Lock***  
RTC locking object
- ***\_\_IO HAL\_RTCStateTypeDef RTC\_HandleTypeDef::State***  
Time communication state

## 42.2 RTC Firmware driver API description

### 42.2.1 RTC Operating Condition

The real-time clock (RTC) and the RTC backup registers can be powered from the VBAT voltage when the main VDD supply is powered off. To retain the content of the RTC backup registers and supply the RTC when VDD is turned off, VBAT pin can be connected to an optional standby voltage supplied by a battery or by another source.

To allow the RTC to operate even when the main digital supply (VDD) is turned off, the VBAT pin powers the following blocks:

1. The RTC
2. The LSE oscillator
3. PC13 to PC15 I/Os (when available)

When the backup domain is supplied by VDD (analog switch connected to VDD), the following functions are available:

1. PC14 and PC15 can be used as either GPIO or LSE pins
2. PC13 can be used as a GPIO or as the RTC\_OUT pin

When the backup domain is supplied by VBAT (analog switch connected to VBAT because VDD is not present), the following functions are available:

1. PC14 and PC15 can be used as LSE pins only
2. PC13 can be used as the RTC\_OUT pin

#### 42.2.2 Backup Domain Reset

The backup domain reset sets all RTC registers and the RCC\_BDCR register to their reset values. A backup domain reset is generated when one of the following events occurs:

1. Software reset, triggered by setting the BDRST bit in the RCC Backup domain control register (RCC\_BDCR).
2. VDD or VBAT power on, if both supplies have previously been powered off.

#### 42.2.3 Backup Domain Access

After reset, the backup domain (RTC registers, RTC backup data registers and backup SRAM) is protected against possible unwanted write accesses.

To enable access to the RTC Domain and RTC registers, proceed as follows:

1. Enable the Power Controller (PWR) APB1 interface clock using the \_\_HAL\_RCC\_PWR\_CLK\_ENABLE() function.
2. Enable access to RTC domain using the HAL\_PWR\_EnableBkUpAccess() function.
3. Select the RTC clock source using the \_\_HAL\_RCC\_RTC\_CONFIG() function.
4. Enable RTC Clock using the \_\_HAL\_RCC\_RTC\_ENABLE() function.

#### 42.2.4 How to use RTC Driver

- Enable the RTC domain access (see description in the section above).
- Configure the RTC Prescaler (Asynchronous and Synchronous) and RTC hour format using the HAL\_RTC\_Init() function.

##### Time and Date configuration

- To configure the RTC Calendar (Time and Date) use the HAL\_RTC\_SetTime() and HAL\_RTC\_SetDate() functions.
- To read the RTC Calendar, use the HAL\_RTC\_GetTime() and HAL\_RTC\_GetDate() functions.

##### Alarm configuration

- To configure the RTC Alarm use the HAL\_RTC\_SetAlarm() function. You can also configure the RTC Alarm with interrupt mode using the HAL\_RTC\_SetAlarm\_IT() function.
- To read the RTC Alarm, use the HAL\_RTC\_GetAlarm() function.

### RTC Wakeup configuration

- To configure the RTC Wakeup Clock source and Counter use the HAL\_RTC\_SetWakeUpTimer() function. You can also configure the RTC Wakeup timer with interrupt mode using the HAL\_RTC\_SetWakeUpTimer\_IT() function.
- To read the RTC WakeUp Counter register, use the HAL\_RTC\_GetWakeUpTimer() function.

### TimeStamp configuration

- Configure the RTC\_AF trigger and enables the RTC TimeStamp using the HAL\_RTC\_SetTimeStamp() function. You can also configure the RTC TimeStamp with interrupt mode using the HAL\_RTC\_SetTimeStamp\_IT() function.
- To read the RTC TimeStamp Time and Date register, use the HAL\_RTC\_GetTimeStamp() function.

### Tamper configuration

- Enable the RTC Tamper and Configure the Tamper filter count, trigger Edge or Level according to the Tamper filter (if equal to 0 Edge else Level) value, sampling frequency, precharge or discharge and Pull-UP using the HAL\_RTC\_SetTamper() function. You can configure RTC Tamper with interrupt mode using HAL\_RTC\_SetTamper\_IT() function.

### Backup Data Registers configuration

- To write to the RTC Backup Data registers, use the HAL\_RTC\_BKUPWrite() function.
- To read the RTC Backup Data registers, use the HAL\_RTC\_BKUPRead() function.

## 42.2.5 RTC and low power modes

The MCU can be woken up from a low power mode by an RTC alternate function.

The RTC alternate functions are the RTC alarms (Alarm A and Alarm B), RTC wakeup, RTC tamper event detection and RTC time stamp event detection. These RTC alternate functions can wake up the system from the Stop and Standby low power modes.

The system can also wake up from low power modes without depending on an external interrupt (Auto-wakeup mode), by using the RTC alarm or the RTC wakeup events.

The RTC provides a programmable time base for waking up from the Stop or Standby mode at regular intervals. Wakeup from STOP and Standby modes is possible only when the RTC clock source is LSE or LSI.

## 42.2.6 Initialization and de-initialization functions

This section provides functions allowing to initialize and configure the RTC Prescaler (Synchronous and Asynchronous), RTC Hour format, disable RTC registers Write protection, enter and exit the RTC initialization mode, RTC registers synchronization check and reference clock detection enable.

1. The RTC Prescaler is programmed to generate the RTC 1Hz time base. It is split into 2 programmable prescalers to minimize power consumption.
  - A 7-bit asynchronous prescaler and a 15-bit synchronous prescaler.
  - When both prescalers are used, it is recommended to configure the asynchronous prescaler to a high value to minimize power consumption.
2. All RTC registers are Write protected. Writing to the RTC registers is enabled by writing a key into the Write Protection register, RTC\_WPR.

3. To configure the RTC Calendar, user application should enter initialization mode. In this mode, the calendar counter is stopped and its value can be updated. When the initialization sequence is complete, the calendar restarts counting after 4 RTCCLK cycles.
4. To read the calendar through the shadow registers after Calendar initialization, calendar update or after wakeup from low power modes the software must first clear the RSF flag. The software must then wait until it is set again before reading the calendar, which means that the calendar registers have been correctly copied into the RTC\_TR and RTC\_DR shadow registers. The HAL\_RTC\_WaitForSynchro() function implements the above software sequence (RSF clear and RSF check).

This section contains the following APIs:

- [\*HAL\\_RTC\\_Init\(\)\*](#)
- [\*HAL\\_RTC\\_DeInit\(\)\*](#)
- [\*HAL\\_RTC\\_MspInit\(\)\*](#)
- [\*HAL\\_RTC\\_MspDeInit\(\)\*](#)

#### **42.2.7 RTC Time and Date functions**

This section provides functions allowing to configure Time and Date features

This section contains the following APIs:

- [\*HAL\\_RTC\\_SetTime\(\)\*](#)
- [\*HAL\\_RTC\\_GetTime\(\)\*](#)
- [\*HAL\\_RTC\\_SetDate\(\)\*](#)
- [\*HAL\\_RTC\\_GetDate\(\)\*](#)

#### **42.2.8 RTC Alarm functions**

This section provides functions allowing to configure Alarm feature

This section contains the following APIs:

- [\*HAL\\_RTC\\_SetAlarm\(\)\*](#)
- [\*HAL\\_RTC\\_SetAlarm\\_IT\(\)\*](#)
- [\*HAL\\_RTC\\_DeactivateAlarm\(\)\*](#)
- [\*HAL\\_RTC\\_GetAlarm\(\)\*](#)

This parameter can be one of the following values: <ul style="list-style-type: none"> <li>– RTC_ALARM_A: AlarmA</li> <li>– RTC_ALARM_B: AlarmB</li> </ul> </li> <li>• <b>Format:</b> Specifies the format of the entered parameters. This</li> </ul> |

parameter can be one of the following values:

- RTC\_FORMAT\_BIN: Binary data format
- RTC\_FORMAT\_BCD: BCD data format

#### Return values

- **HAL:** status

### **HAL\_RTC\_AlarmIRQHandler**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_RTC_AlarmIRQHandler (RTC_HandleTypeDef * hrtc)</b>              |
| Function description | Handle Alarm interrupt request.                                             |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

### **HAL\_RTC\_PollForAlarmAEvent**

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_RTC_PollForAlarmAEvent (RTC_HandleTypeDef * hrtc, uint32_t Timeout)</b>                        |
| Function description | Handle AlarmA Polling request.                                                                                          |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> <li>• <b>Timeout:</b> Timeout duration</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                  |

### **HAL\_RTC\_AlarmAEventCallback**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>void HAL_RTC_AlarmAEventCallback (RTC_HandleTypeDef * hrtc)</b>          |
| Function description | Alarm A callback.                                                           |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>             |

### **HAL\_RTC\_WaitForSynchro**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_RTC_WaitForSynchro (RTC_HandleTypeDef * hrtc)</b>  |
| Function description | @addtogroup RTC_Exported_Functions_Group4 Peripheral Control functions      |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>      |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | <ul style="list-style-type: none"> <li>• The RTC Resynchronization mode is write protected, use the <code>_HAL_RTC_WRITEPROTECTION_DISABLE()</code> before calling this function.</li> <li>• To read the calendar through the shadow registers after Calendar initialization, calendar update or after wakeup from low power modes the software must first clear the RSF flag. The software must then wait until it is set again before reading the calendar, which means that the calendar registers have been correctly copied into the RTC_TR and RTC_DR shadow</li> </ul> |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

registers.

### **HAL\_RTC\_GetState**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Function name        | <b>HAL_RTCStateTypeDef HAL_RTC_GetState<br/>(RTC_HandleTypeDef * hrtc)</b>  |
| Function description | @addtogroup RTC_Exported_Functions_Group5 Peripheral State functions        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> state</li> </ul>       |

### **RTC\_EnterInitMode**

|                      |                                                                                                                                                                                                                                                           |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

***RTC Exported Macros***

`_HAL_RTC_RESET_HANDLE_STATE`

**Description:**

- Reset RTC handle state.

**Parameters:**

- `_HANDLE_`: RTC handle.

**Return value:**

- None

`_HAL_RTC_WRITEPROTECTION_DISABLE`

**Description:**

- Disable the write protection for RTC registers.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.

**Return value:**

- None

`_HAL_RTC_WRITEPROTECTION_ENABLE`

**Description:**

- Enable the write protection for RTC registers.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.

**Return value:**

- None

`_HAL_RTC_ALARMA_ENABLE`

**Description:**

- Enable the RTC ALARMA peripheral.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.

`__HAL_RTC_ALARMA_DISABLE`

**Return value:**

- None

**Description:**

- Disable the RTC ALARMA peripheral.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_ALARM_B_ENABLE`

**Description:**

- Enable the RTC ALARM\_B peripheral.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_ALARM_B_DISABLE`

**Description:**

- Disable the RTC ALARM\_B peripheral.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_ALARM_ENABLE_IT`

**Description:**

- Enable the RTC Alarm interrupt.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.
- `__INTERRUPT__`: specifies the RTC Alarm interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - `RTC_IT_ALRA`: Alarm A interrupt
  - `RTC_IT_ALRB`: Alarm B interrupt

**Return value:**

- None

#### \_HAL\_RTC\_ALARM\_DISABLE\_IT

- Disable the RTC Alarm interrupt.

#### **Parameters:**

- \_HANDLE\_: specifies the RTC handle.
- \_INTERRUPT\_: specifies the RTC Alarm interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - RTC\_IT\_ALRA: Alarm A interrupt
  - RTC\_IT\_ALRB: Alarm B interrupt

#### **Return value:**

- None

#### \_HAL\_RTC\_ALARM\_GET\_IT

- Check whether the specified RTC Alarm interrupt has occurred or not.

#### **Parameters:**

- \_HANDLE\_: specifies the RTC handle.
- \_INTERRUPT\_: specifies the RTC Alarm interrupt to check. This parameter can be:
  - RTC\_IT\_ALRA: Alarm A interrupt
  - RTC\_IT\_ALRB: Alarm B interrupt

#### **Return value:**

- None

#### \_HAL\_RTC\_ALARM\_GET\_IT\_SOURCE

- Check whether the specified RTC Alarm interrupt has been enabled or not.

#### **Parameters:**

- \_HANDLE\_: specifies the RTC handle.
- \_INTERRUPT\_: specifies the RTC Alarm interrupt sources to check. This parameter can be:
  - RTC\_IT\_ALRA: Alarm A interrupt
  - RTC\_IT\_ALRB: Alarm B interrupt

---

interrupt

**Return value:**

- None

`__HAL_RTC_ALARM_GET_FLAG`

**Description:**

- Get the selected RTC Alarm's flag status.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.
- `__FLAG__`: specifies the RTC Alarm Flag sources to check. This parameter can be:
  - `RTC_FLAG_ALRAF`
  - `RTC_FLAG_ALRBF`
  - `RTC_FLAG_ALRAWF`
  - `RTC_FLAG_ALRBWF`

**Return value:**

- None

`__HAL_RTC_ALARM_CLEAR_FLAG`

**Description:**

- Clear the RTC Alarm's pending flags.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.
- `__FLAG__`: specifies the RTC Alarm Flag sources to clear. This parameter can be:
  - `RTC_FLAG_ALRAF`
  - `RTC_FLAG_ALRBF`

**Return value:**

- None

`__HAL_RTC_ALARM_EXTI_ENABLE_IT`

**Description:**

- Enable interrupt on the RTC Alarm associated Exti line.

**Return value:**

- None

`__HAL_RTC_ALARM_EXTI_DISABLE_IT`

**Description:**

- Disable interrupt on the RTC Alarm associated Exti line.

**Return value:**

- None

`__HAL_RTC_ALARM_EXTI_ENABLE_EVENT`

**Description:**

- Enable event on the RTC Alarm associated Exti line.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_DISABLE_EVENT`

**Description:**

- Disable event on the RTC Alarm associated Exti line.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_ENABLE_FALLING_EDGE`

**Description:**

- Enable falling edge trigger on the RTC Alarm associated Exti line.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_DISABLE_FALLING_EDGE`

**Description:**

- Disable falling edge trigger on the RTC Alarm associated Exti line.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_ENABLE_RISING_EDGE`

**Description:**

- Enable rising edge trigger on the RTC Alarm associated Exti line.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_DISABLE_RISING_EDGE`

**Description:**

- Disable rising edge trigger on the RTC Alarm associated Exti line.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_ENABLE_RISING_FALLING_EDGE`

**Description:**

- Enable rising & falling edge trigger on the RTC Alarm associated Exti line.

**Return value:**

- None.

---

`__HAL_RTC_ALARM_EXTI_DISABLE_RISING_EDGE`

**Description:**

- Disable rising & falling edge trigger on the RTC Alarm associated Exti line.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_GET_FLAG`

**Description:**

- Check whether the RTC Alarm associated Exti line interrupt flag is set or not.

**Return value:**

- Line: Status.

`__HAL_RTC_ALARM_EXTI_CLEAR_FLAG`

**Description:**

- Clear the RTC Alarm associated Exti line flag.

**Return value:**

- None.

`__HAL_RTC_ALARM_EXTI_GENERATE_SWIT`

**Description:**

- Generate a Software interrupt on RTC Alarm associated Exti line.

**Return value:**

- None.

## 43 HAL RTC Extension Driver

### 43.1 RTCEEx Firmware driver registers structures

#### 43.1.1 RTC\_TamperTypeDef

##### Data Fields

- *uint32\_t Tamper*
- *uint32\_t Trigger*
- *uint32\_t Filter*
- *uint32\_t SamplingFrequency*
- *uint32\_t PrechargeDuration*
- *uint32\_t TamperPullUp*
- *uint32\_t TimeStampOnTamperDetection*

##### Field Documentation

- *uint32\_t RTC\_TamperTypeDef::Tamper*  
Specifies the Tamper Pin. This parameter can be a value of  
[\*RTCEEx\\_Tamper\\_Pins\\_Definitions\*](#)
- *uint32\_t RTC\_TamperTypeDef::Trigger*  
Specifies the Tamper Trigger. This parameter can be a value of  
[\*RTCEEx\\_Tamper\\_Trigger\\_Definitions\*](#)
- *uint32\_t RTC\_TamperTypeDef::Filter*  
Specifies the RTC Filter Tamper. This parameter can be a value of  
[\*RTCEEx\\_Tamper\\_Filter\\_Definitions\*](#)
- *uint32\_t RTC\_TamperTypeDef::SamplingFrequency*  
Specifies the sampling frequency. This parameter can be a value of  
[\*RTCEEx\\_Tamper\\_Sampling\\_Frequencies\\_Definitions\*](#)
- *uint32\_t RTC\_TamperTypeDef::PrechargeDuration*  
Specifies the Precharge Duration . This parameter can be a value of  
[\*RTCEEx\\_Tamper\\_Pin\\_Precharge\\_Duration\\_Definitions\*](#)
- *uint32\_t RTC\_TamperTypeDef::TamperPullUp*  
Specifies the Tamper PullUp . This parameter can be a value of  
[\*RTCEEx\\_Tamper\\_Pull\\_UP\\_Definitions\*](#)
- *uint32\_t RTC\_TamperTypeDef::TimeStampOnTamperDetection*  
Specifies the TimeStampOnTamperDetection. This parameter can be a value of  
[\*RTCEEx\\_Tamper\\_TimeStampOnTamperDetection\\_Definitions\*](#)

### 43.2 RTCEEx Firmware driver API description

#### 43.2.1 How to use this driver

- Enable the RTC domain access.
- Configure the RTC Prescaler (Asynchronous and Synchronous) and RTC hour format using the HAL\_RTC\_Init() function.

##### RTC Wakeup configuration

- To configure the RTC Wakeup Clock source and Counter use the HAL\_RTCEEx\_SetWakeUpTimer() function. You can also configure the RTC Wakeup timer with interrupt mode using the HAL\_RTCEEx\_SetWakeUpTimer\_IT() function.

- To read the RTC WakeUp Counter register, use the HAL\_RTCEEx\_SetWakeUpTimer() function.

### TimeStamp configuration

- Configure the RTC\_AF trigger and enable the RTC TimeStamp using the HAL\_RTCEEx\_SetTimeStamp() function. You can also configure the RTC TimeStamp with interrupt mode using the HAL\_RTCEEx\_SetTimeStamp\_IT() function.
- To read the RTC TimeStamp Time and Date register, use the HAL\_RTCEEx\_GetTimeStamp() function.
- The TIMESTAMP alternate function is mapped to RTC\_AF1 (PC13U).

### Tamper configuration

- Enable the RTC Tamper and configure the Tamper filter count, trigger Edge or Level according to the Tamper filter (if equal to 0 Edge else Level) value, sampling frequency, precharge or discharge and Pull-UP using the HAL\_RTCEEx\_SetTamper() function. You can configure RTC Tamper with interrupt mode using HAL\_RTCEEx\_SetTamper\_IT() function.
- The TAMPER1 alternate function is mapped to RTC\_AF1 (PC13U).

### Backup Data Registers configuration

- To write to the RTC Backup Data registers, use the HAL\_RTCEEx\_BKUPWrite() function.
- To read the RTC Backup Data registers, use the HAL\_RTCEEx\_BKUPRead() function.

## 43.2.2 RTC TimeStamp and Tamper functions

This section provides functions allowing to configure TimeStamp feature

This section contains the following APIs:

- [`HAL\_RTCEEx\_SetTimeStamp\(\)`](#)
- [`HAL\_RTCEEx\_SetTimeStamp\_IT\(\)`](#)
- [`HAL\_RTCEEx\_DeactivateTimeStamp\(\)`](#)
- [`HAL\_RTCEEx\_GetTimeStamp\(\)`](#)
- [`HAL\_RTCEEx\_SetTamper\(\)`](#)
- [`HAL\_RTCEEx\_SetTamper\_IT\(\)`](#)
- [`HAL\_RTCEEx\_DeactivateTamper\(\)`](#)
- [`HAL\_RTCEEx\_TamperTimeStampIRQHandler\(\)`](#)
- [`HAL\_RTCEEx\_TimeStampEventCallback\(\)`](#)
- [`HAL\_RTCEEx\_Tamper1EventCallback\(\)`](#)
- [`HAL\_RTCEEx\_Tamper2EventCallback\(\)`](#)
- [`HAL\_RTCEEx\_Tamper3EventCallback\(\)`](#)
- [`HAL\_RTCEEx\_PollForTimeStampEvent\(\)`](#)
- [`HAL\_RTCEEx\_PollForTamper1Event\(\)`](#)
- [`HAL\_RTCEEx\_PollForTamper2Event\(\)`](#)
- [`HAL\_RTCEEx\_PollForTamper3Event\(\)`](#)

## 43.2.3 RTC Wake-up functions

This section provides functions allowing to configure Wake-up feature

This section contains the following APIs:

- [`HAL\_RTCEEx\_SetWakeUpTimer\(\)`](#)
- [`HAL\_RTCEEx\_SetWakeUpTimer\_IT\(\)`](#)

- [\*HAL\\_RTCEx\\_DeactivateWakeUpTimer\(\)\*](#)
- [\*HAL\\_RTCEx\\_GetWakeUpTimer\(\)\*](#)
- [\*HAL\\_RTCEx\\_WakeUpTimerIRQHandler\(\)\*](#)
- [\*HAL\\_RTCEx\\_WakeUpTimerEventCallback\(\)\*](#)
- [\*HAL\\_RTCEx\\_PollForWakeUpTimerEvent\(\)\*](#)

#### 43.2.4 Extended Peripheral Control functions

This subsection provides functions allowing to

- Write a data in a specified RTC Backup data register
- Read a data in a specified RTC Backup data register
- Set the Coarse calibration parameters.
- Deactivate the Coarse calibration parameters
- Set the Smooth calibration parameters.
- Configure the Synchronization Shift Control Settings.
- Configure the Calibration Pinout (RTC\_CALIB) Selection (1Hz or 512Hz).
- Deactivate the Calibration Pinout (RTC\_CALIB) Selection (1Hz or 512Hz).
- Enable the RTC reference clock detection.
- Disable the RTC reference clock detection.
- Enable the Bypass Shadow feature.
- Disable the Bypass Shadow feature.

This section contains the following APIs:

- [\*HAL\\_RTCEx\\_BKUPWrite\(\)\*](#)
- [\*HAL\\_RTCEx\\_BKUPRead\(\)\*](#)
- [\*HAL\\_RTCEx\\_SetSmoothCalib\(\)\*](#)
- [\*HAL\\_RTCEx\\_SetSynchroShift\(\)\*](#)
- [\*HAL\\_RTCEx\\_SetCalibrationOutPut\(\)\*](#)
- [\*HAL\\_RTCEx\\_DeactivateCalibrationOutPut\(\)\*](#)
- [\*HAL\\_RTCEx\\_SetRefClock\(\)\*](#)
- [\*HAL\\_RTCEx\\_DeactivateRefClock\(\)\*](#)
- [\*HAL\\_RTCEx\\_EnableBypassShadow\(\)\*](#)
- [\*HAL\\_RTCEx\\_DisableBypassShadow\(\)\*](#)

#### 43.2.5 Extended features functions

This section provides functions allowing to:

- RTC Alram B callback
- RTC Poll for Alarm B request

This section contains the following APIs:

- [\*HAL\\_RTCEx\\_AlarmBEventCallback\(\)\*](#)
- [\*HAL\\_RTCEx\\_PollForAlarmBEvent\(\)\*](#)

#### 43.2.6 Detailed description of functions

##### **HAL\_RTCEx\_SetTimeStamp**

Function name      **HAL\_StatusTypeDef HAL\_RTCEx\_SetTimeStamp  
(RTC\_HandleTypeDef \* hrtc, uint32\_t TimeStampEdge,  
uint32\_t RTC\_TimeStampPin)**

Function description      SetTimeStamp.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameters    | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> <li>• <b>TimeStampEdge:</b> Specifies the pin edge on which the TimeStamp is activated. This parameter can be one of the following values:           <ul style="list-style-type: none"> <li>– RTC_TIMESTAMPEDGE_RISING: the Time stamp event occurs on the rising edge of the related pin.</li> <li>– RTC_TIMESTAMPEDGE_FALLING: the Time stamp event occurs on the falling edge of the related pin.</li> </ul> </li> <li>• <b>RTC_TimeStampPin:</b> specifies the RTC TimeStamp Pin. This parameter can be one of the following values:           <ul style="list-style-type: none"> <li>– RTC_TIMESTAMPPIN_DEFAULT: PC13 is selected as RTC TimeStamp Pin.</li> </ul> </li> </ul> |
| Return values | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Notes         | <ul style="list-style-type: none"> <li>• This API must be called before enabling the TimeStamp feature.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### HAL\_RTCEx\_SetTimeStamp\_IT

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Function description | Set the Smooth calibration parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> <li>• <b>SmoothCalibPeriod:</b> Select the Smooth Calibration Period. This parameter can be one of the following values : <ul style="list-style-type: none"> <li>– RTC_SMOOTHCALIB_PERIOD_32SEC: The smooth calibration period is 32s.</li> <li>– RTC_SMOOTHCALIB_PERIOD_16SEC: The smooth calibration period is 16s.</li> <li>– RTC_SMOOTHCALIB_PERIOD_8SEC: The smooth calibration period is 8s.</li> </ul> </li> </ul> |

- **SmoothCalibPlusPulses:** Select to Set or reset the CALP bit. This parameter can be one of the following values:
  - RTC\_SMOOTHCALIB\_PLUSPULSES\_SET: Add one RTCCLK pulse every 2\*11 pulses.
  - RTC\_SMOOTHCALIB\_PLUSPULSES\_RESET: No RTCCLK pulses are added.
- **SmoothCalibMinusPulsesValue:** Select the value of CALM[8:0] bits. This parameter can be one any value from 0 to 0x000001FF.

Return values

- **HAL:** status

Notes

- To deactivate the smooth calibration, the field SmoothCalibPlusPulses must be equal to SMOOTHCALIB\_PLUSPULSES\_RESET and the field SmoothCalibMinusPulsesValue mut be equal to 0.

| Parameters           | <ul style="list-style-type: none"> <li>• <b>hrtc:</b> RTC handle</li> </ul>           |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                |

**Notes**

- When the Bypass Shadow is enabled the calendar value are taken directly from the Calendar counter.

**HAL\_RTCEx\_AlarmBEventCallback**

Function name      **void HAL\_RTCEx\_AlarmBEventCallback  
(RTC\_HandleTypeDef \* hrtc)**

Function description      Alarm B callback.

Parameters      • **hrtc:** RTC handle

Return values      • **None**

**HAL\_RTCEx\_PollForAlarmBEvent**

Function name      **HAL\_StatusTypeDef HAL\_RTCEx\_PollForAlarmBEvent  
(RTC\_HandleTypeDef \* hrtc, uint32\_t Timeout)**

Function description      This function handles AlarmB Polling request.

Parameters      • **hrtc:** RTC handle  
• **Timeout:** Timeout duration

Return values      • **HAL:** status

***RTC Extended Calibration***`__HAL_RTC_CALIBRATION_OUTPUT_ENABLE`**Description:**

- Enable the RTC calibration output.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_CALIBRATION_OUTPUT_DISABLE`**Description:**

- Disable the calibration output.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_CLOCKREF_DETECTION_ENABLE`**Description:**

- Enable the clock reference detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_CLOCKREF_DETECTION_DISABLE`**Description:**

- Disable the clock reference detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_SHIFT_GET_FLAG`**Description:**

- Get the selected RTC shift operation's flag status.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.
- `__FLAG__`: specifies the RTC shift operation Flag is pending

or not. This parameter can be:

- RTC\_FLAG\_SHPF

#### **Return value:**

- None

RTC\_SMOOTHCALIB\_PERIOD\_32SEC If RTCCLK = 32768 Hz, Smooth calibration period is 32s, else 2exp20 RTCCLK seconds

RTC\_SMOOTHCALIB\_PERIOD\_16SEC If RTCCLK = 32768 Hz, Smooth calibration period is 16s, else 2exp19 RTCCLK seconds

`RTC_SMOOTHCALIB_PERIOD_8SEC` If RTCCLK = 32768 Hz, Smooth calibration period is 8s, else  $2^{\text{exp}18}$  RTCCLK seconds

***RTC Extended Smooth calib Plus pulses Definition***

`RTC_SMOOTHCALIB_PLUSPULSES_RESET` The number of RTCCLK pulses substituted during a 32-second window = CALM[8:0]

`RTC_SMOOTHCALIB_PLUSPULSES_SET` The number of RTCCLK pulses added during a X -second window = Y - CALM[8:0] with Y = 512U, 256U, 128 when X = 32U, 16U, 8U

***RTC Extended Tamper***

`__HAL_RTC_TAMPER1_ENABLE`

**Description:**

- Enable the RTC Tamper1 input detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_TAMPER1_DISABLE`

**Description:**

- Disable the RTC Tamper1 input detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_TAMPER2_ENABLE`

**Description:**

- Enable the RTC Tamper2 input detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_TAMPER2_DISABLE`

**Description:**

- Disable the RTC Tamper2 input detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

`__HAL_RTC_TAMPER3_ENABLE`**Return value:**

- None

**Description:**

- Enable the RTC Tamper3 input detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_TAMPER3_DISABLE`**Description:**

- Disable the RTC Tamper3 input detection.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.

**Return value:**

- None

`__HAL_RTC_TAMPER_ENABLE_IT`**Description:**

- Enable the RTC Tamper interrupt.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.
- `__INTERRUPT__`: specifies the RTC Tamper interrupt sources to be enabled. This parameter can be any combination of the following values:
  - `RTC_IT_TAMP`: Tamper interrupt

**Return value:**

- None

`__HAL_RTC_TAMPER_DISABLE_IT`**Description:**

- Disable the RTC Tamper interrupt.

**Parameters:**

- `__HANDLE__`: specifies the RTC handle.
- `__INTERRUPT__`: specifies the RTC Tamper interrupt sources to be disabled. This parameter can be any combination of the following values:
  - `RTC_IT_TAMP`: Tamper interrupt

**Return value:**

- None

### `_HAL_RTC_TAMPER_GET_IT`

#### **Description:**

- Check whether the specified RTC Tamper interrupt has occurred or not.

#### **Parameters:**

- `_HANDLE_`: specifies the RTC handle.
- `_INTERRUPT_`: specifies the RTC Tamper interrupt to check. This parameter can be:
  - `RTC_IT_TAMP1`: Tamper1 interrupt
  - `RTC_IT_TAMP2`: Tamper2 interrupt
  - `RTC_IT_TAMP3`: Tamper3 interrupt (\*)

#### **Return value:**

- None

#### **Notes:**

- (\*) `RTC_IT_TAMP3` not present on all the devices

### `_HAL_RTC_TAMPER_GET_IT_SOURCE`

#### **Description:**

- Check whether the specified RTC Tamper interrupt has been enabled or not.

#### **Parameters:**

- `_HANDLE_`: specifies the RTC handle.
- `_INTERRUPT_`: specifies the RTC Tamper interrupt source to check. This parameter can be:
  - `RTC_IT_TAMP`: Tamper interrupt

#### **Return value:**

- None

### `_HAL_RTC_TAMPER_GET_FLAG`

#### **Description:**

- Get the selected RTC Tamper's flag status.

#### **Parameters:**

- `_HANDLE_`: specifies the RTC handle.
- `_FLAG_`: specifies the RTC Tamper Flag is pending or not. This parameter can be:
  - `RTC_FLAG_TAMP1F`
  - `RTC_FLAG_TAMP2F`

- RTC\_FLAG\_TAMP3F (\*)

**Return value:**

- None

**Notes:**

- (\*) RTC\_FLAG\_TAMP3F not present on all the devices

[\\_\\_HAL\\_RTC\\_TAMPER\\_CLEAR\\_FLAG](#)**Description:**

- Clear the RTC Tamper's pending flags.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the RTC handle.
- [\\_\\_FLAG\\_\\_](#): specifies the RTC Tamper Flag to clear. This parameter can be:
  - RTC\_FLAG\_TAMP1F
  - RTC\_FLAG\_TAMP2F
  - RTC\_FLAG\_TAMP3F (\*)

**Return value:**

- None

**Notes:**

- (\*) RTC\_FLAG\_TAMP3F not present on all the devices

`_HAL_RTC_TIMESTAMP_ENABLE`

**Description:**

- Enable the RTC TimeStamp peripheral.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.

**Return value:**

- None

`_HAL_RTC_TIMESTAMP_DISABLE`

**Description:**

- Disable the RTC TimeStamp peripheral.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.

**Return value:**

- None

`_HAL_RTC_TIMESTAMP_ENABLE_IT`

**Description:**

- Enable the RTC TimeStamp interrupt.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.
- `_INTERRUPT_`: specifies the RTC TimeStamp interrupt source to be enabled. This parameter can be:
  - `RTC_IT_TS`: TimeStamp interrupt

**Return value:**

- None

`_HAL_RTC_TIMESTAMP_DISABLE_IT`

**Description:**

- Disable the RTC TimeStamp interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the RTC handle.
- \_\_INTERRUPT\_\_: specifies the RTC TimeStamp interrupt source to be disabled. This parameter can be:
  - RTC\_IT\_TS: TimeStamp interrupt

**Return value:**

- None

\_HAL\_RTC\_TIMESTAMP\_GET\_IT

**Description:**

- Check whether the specified RTC TimeStamp interrupt has occurred or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the RTC handle.
- \_\_INTERRUPT\_\_: specifies the RTC TimeStamp interrupt to check. This parameter can be:
  - RTC\_IT\_TS: TimeStamp interrupt

**Return value:**

- None

\_HAL\_RTC\_TIMESTAMP\_GET\_IT\_SOURCE

**Description:**

- Check whether the specified RTC Time Stamp interrupt has been enabled or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the RTC handle.
- \_\_INTERRUPT\_\_: specifies the RTC Time Stamp interrupt source to check. This parameter can be:
  - RTC\_IT\_TS: TimeStamp interrupt

**Return value:**

- None

\_HAL\_RTC\_TIMESTAMP\_GET\_FLAG

**Description:**

- Get the selected RTC TimeStamp's flag status.

**Parameters:**

- \_\_HANDLE\_\_: specifies the RTC handle.
- \_\_FLAG\_\_: specifies the RTC

TimeStamp Flag is pending or not.

This parameter can be:

- RTC\_FLAG\_TSF
- RTC\_FLAG\_TSOVF

**Return value:**

- None

`_HAL_RTC_TIMESTAMP_CLEAR_FLAG`

**Description:**

- Clear the RTC Time Stamp's pending flags.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.
- `_FLAG_`: specifies the RTC Alarm Flag to clear. This parameter can be:
  - RTC\_FLAG\_TSF

**Return value:**

- None

***RTC Extended TimeStamp Pin Selection***

`RTC_TIMESTAMPEDGE_FALLING`

***RTC Extended WakeUp Timer***

`_HAL_RTC_WAKEUPTIMER_ENABLE`

**Description:**

- Enable the RTC WakeUp Timer peripheral.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.

**Return value:**

- None

`_HAL_RTC_WAKEUPTIMER_DISABLE`

**Description:**

- Disable the RTC WakeUp Timer peripheral.

**Parameters:**

- `_HANDLE_`: specifies the RTC handle.

**Return value:**

- None

[\\_\\_HAL\\_RTC\\_WAKEUPTIMER\\_ENABLE\\_IT](#)**Description:**

- Enable the RTC WakeUpTimer interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the RTC handle.
- \_\_INTERRUPT\_\_: specifies the RTC WakeUpTimer interrupt sources to be enabled. This parameter can be:
  - RTC\_IT\_WUT: WakeUpTimer interrupt

**Return value:**

- None

[\\_\\_HAL\\_RTC\\_WAKEUPTIMER\\_DISABLE\\_IT](#)**Description:**

- Disable the RTC WakeUpTimer interrupt.

**Parameters:**

- \_\_HANDLE\_\_: specifies the RTC handle.
- \_\_INTERRUPT\_\_: specifies the RTC WakeUpTimer interrupt sources to be disabled. This parameter can be:
  - RTC\_IT\_WUT: WakeUpTimer interrupt

**Return value:**

- None

[\\_\\_HAL\\_RTC\\_WAKEUPTIMER\\_GET\\_IT](#)**Description:**

- Check whether the specified RTC WakeUpTimer interrupt has occurred or not.

**Parameters:**

- \_\_HANDLE\_\_: specifies the RTC handle.
- \_\_INTERRUPT\_\_: specifies the RTC WakeUpTimer interrupt to check. This parameter can be:
  - RTC\_IT\_WUT: WakeUpTimer interrupt

**Return value:**

- None

[\\_\\_HAL\\_RTC\\_WAKEUPTIMER\\_GET\\_IT\\_SOURCE](#)**Description:**

- Check whether the specified RTC Wake Up timer interrupt has been enabled or not.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the RTC handle.
- [\\_\\_INTERRUPT\\_\\_](#): specifies the RTC Wake Up timer interrupt sources to check. This parameter can be:
  - [RTC\\_IT\\_WUT](#): WakeUpTimer interrupt

**Return value:**

- None

[\\_\\_HAL\\_RTC\\_WAKEUPTIMER\\_GET\\_FLAG](#)**Description:**

- Get the selected RTC WakeUpTimer's flag status.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the RTC handle.
- [\\_\\_FLAG\\_\\_](#): specifies the RTC WakeUpTimer Flag is pending or not. This parameter can be:
  - [RTC\\_FLAG\\_WUTF](#)
  - [RTC\\_FLAG\\_WUTWF](#)

**Return value:**

- None

[\\_\\_HAL\\_RTC\\_WAKEUPTIMER\\_CLEAR\\_FLAG](#)**Description:**

- Clear the RTC Wake Up timer's pending flags.

**Parameters:**

- [\\_\\_HANDLE\\_\\_](#): specifies the RTC handle.
- [\\_\\_FLAG\\_\\_](#): specifies the RTC WakeUpTimer Flag to clear. This parameter can be:
  - [RTC\\_FLAG\\_WUTF](#)

**Return value:**

- None

[\\_\\_HAL\\_RTC\\_WAKEUPTIMER\\_EXTI\\_ENABLE\\_IT](#)**Description:**

- Enable interrupt on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None

**Description:**

- Disable interrupt on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None

**Description:**

- Enable event on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

**Description:**

- Disable event on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

**Description:**

- Enable falling edge trigger on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

**Description:**

- Disable falling edge trigger on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

**Description:**

- Enable rising edge trigger on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

**Description:**

- Disable rising edge trigger on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

`__HAL_RTC_WAKEUPTIMER_EXTI_ENABLE  
_RISING_FALLING_EDGE`

**Description:**

- Enable rising & falling edge trigger on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

`__HAL_RTC_WAKEUPTIMER_EXTI_DISABLE  
_RISING_FALLING_EDGE`

**Description:**

- Disable rising & falling edge trigger on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

`__HAL_RTC_WAKEUPTIMER_EXTI_GET_  
FLAG`

**Description:**

- Check whether the RTC WakeUp Timer associated Exti line interrupt flag is set or not.

**Return value:**

- Line: Status.

**Description:**

- Clear the RTC WakeUp Timer associated Exti line flag.

**Return value:**

- None.

**Description:**

- Generate a Software interrupt on the RTC WakeUp Timer associated Exti line.

**Return value:**

- None.

## 44 HAL SDADC Generic Driver

### 44.1 SDADC Firmware driver registers structures

#### 44.1.1 SDADC\_InitTypeDef

##### Data Fields

- *uint32\_t IdleLowPowerMode*
- *uint32\_t FastConversionMode*
- *uint32\_t SlowClockMode*
- *uint32\_t ReferenceVoltage*

##### Field Documentation

- ***uint32\_t SDADC\_InitTypeDef::IdleLowPowerMode***  
Specifies if SDADC can enter in power down or standby when idle. This parameter can be a value of [\*\*SDADC\\_Idle\\_Low\\_Power\\_Mode\*\*](#)
- ***uint32\_t SDADC\_InitTypeDef::FastConversionMode***  
Specifies if Fast conversion mode is enabled or not. This parameter can be a value of [\*\*SDADC\\_Fast\\_Conv\\_Mode\*\*](#)
- ***uint32\_t SDADC\_InitTypeDef::SlowClockMode***  
Specifies if slow clock mode is enabled or not. This parameter can be a value of [\*\*SDADC\\_Slow\\_Clock\\_Mode\*\*](#)
- ***uint32\_t SDADC\_InitTypeDef::ReferenceVoltage***  
Specifies the reference voltage. Note: This parameter is common to all SDADC instances. This parameter can be a value of [\*\*SDADC\\_Reference\\_Voltage\*\*](#)

- ***uint32\_t CommonMode***
- ***uint32\_t Offset***

##### Field Documentation

- ***uint32\_t SDADC\_ConfParamTypeDef::InputMode***  
Specifies the input mode (single ended, differential...) This parameter can be any value of [\*\*SDADC\\_InputMode\*\*](#)
- ***uint32\_t SDADC\_ConfParamTypeDef::Gain***  
Specifies the gain setting. This parameter can be any value of [\*\*SDADC\\_Gain\*\*](#)
- ***uint32\_t SDADC\_ConfParamTypeDef::CommonMode***  
Specifies the common mode setting (VSSA, VDDA, VDDA/2U). This parameter can be any value of [\*\*SDADC\\_CommonMode\*\*](#)
- ***uint32\_t SDADC\_ConfParamTypeDef::Offset***  
Specifies the 12-bit offset value. This parameter can be any value lower or equal to 0x00000FFFU

## 44.2 SDADC Firmware driver API description

### 44.2.1 SDADC specific features

1. 16-bit sigma delta architecture.
2. Self calibration.
3. Interrupt generation at the end of calibration, regular/injected conversion and in case of overrun events.
4. Single and continuous conversion modes.
5. External trigger option with configurable polarity for injected conversion.

6. Multi mode (synchronized another SDADC with SDADC1).
7. DMA request generation during regular or injected channel conversion.

#### 44.2.2 How to use this driver

##### Initialization

1. As prerequisite, fill in the HAL\_SDADC\_MspInit() :
  - Enable SDADCx clock interface with \_\_SDADCx\_CLK\_ENABLE().
  - Configure SDADCx clock divider with HAL\_RCCEx\_PeriphCLKConfig.
  - Enable power on SDADC with HAL\_PWREx\_EnableSDADC().
  - Enable the clocks for the SDADC GPIOs with \_\_HAL\_RCC\_GPIOx\_CLK\_ENABLE().
  - Configure these SDADC pins in analog mode using HAL\_GPIO\_Init().
  - If interrupt mode is used, enable and configure SDADC global interrupt with HAL\_NVIC\_SetPriority() and HAL\_NVIC\_EnableIRQ().
  - If DMA mode is used, configure DMA with HAL\_DMA\_Init and link it with SDADC handle using \_\_HAL\_LINKDMA.
2. Configure the SDADC low power mode, fast conversion mode, slow clock mode and SDADC1 reference voltage using the HAL\_ADC\_Init() function. Note: Common reference voltage. is common to all SDADC instances.
3. Prepare channel configurations (input mode, common mode, gain and offset) using HAL\_SDADC\_PrepChannelConfig and associate channel with one configuration using HAL\_SDADC\_AssociateChannelConfig.

##### Calibration

1. Start calibration using HAL\_SDADC\_StartCalibration or HAL\_SDADC\_CalibrationStart\_IT.
2. In polling mode, use HAL\_SDADC\_PollForCalibEvent to detect the end of calibration.
3. In interrupt mode, HAL\_SDADC\_CalibrationCpltCallback will be called at the end of calibration.

##### Regular channel conversion

1. Select trigger for regular conversion using HAL\_SDADC\_SelectRegularTrigger.
2. Select regular channel and enable/disable continuous mode using HAL\_SDADC\_ConfigChannel.
3. Start regular conversion using HAL\_SDADC\_Start, HAL\_SDADC\_Start\_IT or HAL\_SDADC\_Start\_DMA.
4. In polling mode, use HAL\_SDADC\_PollForConversion to detect the end of regular conversion.
5. In interrupt mode, HAL\_SDADC\_ConvCpltCallback will be called at the end of regular conversion.
6. Get value of regular conversion using HAL\_SDADC\_GetValue.
7. In DMA mode, HAL\_SDADC\_ConvHalfCpltCallback and HAL\_SDADC\_ConvCpltCallback will be called respectively at the half transfer and at the transfer complete.
8. Stop regular conversion using HAL\_SDADC\_Stop, HAL\_SDADC\_Stop\_IT or HAL\_SDADC\_Stop\_DMA.

##### Injected channels conversion

1. Enable/disable delay on injected conversion using HAL\_SDADC\_SelectInjectedDelay.

2. If external trigger is used for injected conversion, configure this trigger using HAL\_SDADC\_SelectInjectedExtTrigger.
3. Select trigger for injected conversion using HAL\_SDADC\_SelectInjectedTrigger.
4. Select injected channels and enable/disable continuous mode using HAL\_SDADC\_InjectedConfigChannel.
5. Start injected conversion using HAL\_SDADC\_InjectedStart, HAL\_SDADC\_InjectedStart\_IT or HAL\_SDADC\_InjectedStart\_DMA.
6. In polling mode, use HAL\_SDADC\_PollForInjectedConversion to detect the end of injected conversion.
7. In interrupt mode, HAL\_SDADC\_InjectedConvCpltCallback will be called at the end of injected conversion.
8. Get value of injected conversion and corresponding channel using HAL\_SDADC\_InjectedGetValue.
9. In DMA mode, HAL\_SDADC\_InjectedConvHalfCpltCallback and HAL\_SDADC\_InjectedConvCpltCallback will be called respectively at the half transfer and at the transfer complete.
10. Stop injected conversion using HAL\_SDADC\_InjectedStop, HAL\_SDADC\_InjectedStop\_IT or HAL\_SDADC\_InjectedStop\_DMA.

### Multi mode regular channels conversions

1. Select type of multimode (SDADC1/SDADC2 or SDADC1/SDADC3) using HAL\_SDADC\_MultiModeConfigChannel.
2. Select software trigger for SDADC1 and synchronized trigger for SDADC2 (or SDADC3) using HAL\_SDADC\_SelectRegularTrigger.
3. Select regular channel for SDADC1 and SDADC2 (or SDADC3) using HAL\_SDADC\_ConfigChannel.
4. Start regular conversion for SDADC2 (or SDADC3) with HAL\_SDADC\_Start.
5. Start regular conversion for SDADC1 using HAL\_SDADC\_Start, HAL\_SDADC\_Start\_IT or HAL\_SDADC\_MultiModeStart\_DMA.
6. In polling mode, use HAL\_SDADC\_PollForConversion to detect the end of regular conversion for SDADC1.
7. In interrupt mode, HAL\_SDADC\_ConvCpltCallback will be called at the end of regular conversion for SDADC1.
8. Get value of regular conversions using HAL\_SDADC\_MultiModeGetValue.
9. In DMA mode, HAL\_SDADC\_ConvHalfCpltCallback and HAL\_SDADC\_ConvCpltCallback will be called respectively at the half transfer and at the transfer complete for SDADC1.
10. Stop regular conversion using HAL\_SDADC\_Stop, HAL\_SDADC\_Stop\_IT or HAL\_SDADC\_MultiModeStop\_DMA for SDADC1.
11. Stop regular conversion using HAL\_SDADC\_Stop for SDADC2 (or SDADC3).

### Multi mode injected channels conversions

1. Select type of multimode (SDADC1/SDADC2 or SDADC1/SDADC3) using HAL\_SDADC\_InjectedMultiModeConfigChannel.
2. Select software or external trigger for SDADC1 and synchronized trigger for SDADC2 (or SDADC3) using HAL\_SDADC\_SelectInjectedTrigger.
3. Select injected channels for SDADC1 and SDADC2 (or SDADC3) using HAL\_SDADC\_InjectedConfigChannel.
4. Start injected conversion for SDADC2 (or SDADC3) with HAL\_SDADC\_InjectedStart.
5. Start injected conversion for SDADC1 using HAL\_SDADC\_InjectedStart, HAL\_SDADC\_InjectedStart\_IT or HAL\_SDADC\_InjectedMultiModeStart\_DMA.
6. In polling mode, use HAL\_SDADC\_InjectedPollForConversion to detect the end of injected conversion for SDADC1.

7. In interrupt mode, HAL\_SDADC\_InjectedConvCpltCallback will be called at the end of injected conversion for SDADC1.
8. Get value of injected conversions using HAL\_SDADC\_InjectedMultiModeGetValue.
9. In DMA mode, HAL\_SDADC\_InjectedConvHalfCpltCallback and HAL\_SDADC\_InjectedConvCpltCallback will be called respectively at the half transfer and at the transfer complete for SDADC1.
10. Stop injected conversion using HAL\_SDADC\_InjectedStop, HAL\_SDADC\_InjectedStop\_IT or HAL\_SDADC\_InjectedMultiModeStop\_DMA for SDADC1.
11. Stop injected conversion using HAL\_SDADC\_InjectedStop for SDADC2 (or SDADC3).

#### 44.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the SDADC.
- De-initialize the SDADC.

This section contains the following APIs:

- [\*HAL\\_SDADC\\_Init\(\)\*](#)
- [\*HAL\\_SDADC\\_DelInit\(\)\*](#)
- [\*HAL\\_SDADC\\_MspInit\(\)\*](#)
- [\*HAL\\_SDADC\\_MspDelInit\(\)\*](#)

#### 44.2.4 Peripheral control functions

This section provides functions allowing to:

- Program one of the three different configurations for channels.
- Associate channel to one of configurations.
- Select regular and injected channels.
- Enable/disable continuous mode for regular and injected conversions.
- Select regular and injected triggers.
- Select and configure injected external trigger.
- Enable/disable delay addition for injected conversions.
- Configure multimode.

This section contains the following APIs:

- [\*HAL\\_SDADC\\_PrepChannelConfig\(\)\*](#)
- [\*HAL\\_SDADC\\_AssociateChannelConfig\(\)\*](#)
- [\*HAL\\_SDADC\\_ConfigChannel\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedConfigChannel\(\)\*](#)
- [\*HAL\\_SDADC\\_SelectRegularTrigger\(\)\*](#)
- [\*HAL\\_SDADC\\_SelectInjectedTrigger\(\)\*](#)
- [\*HAL\\_SDADC\\_SelectInjectedExtTrigger\(\)\*](#)
- [\*HAL\\_SDADC\\_SelectInjectedDelay\(\)\*](#)
- [\*HAL\\_SDADC\\_MultiModeConfigChannel\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedMultiModeConfigChannel\(\)\*](#)

#### 44.2.5 IO operation functions

This section provides functions allowing to:

- Start calibration.
- Poll for the end of calibration.
- Start calibration and enable interrupt.

- Start conversion of regular/injected channel.
- Poll for the end of regular/injected conversion.
- Stop conversion of regular/injected channel.
- Start conversion of regular/injected channel and enable interrupt.
- Stop conversion of regular/injected channel and disable interrupt.
- Start conversion of regular/injected channel and enable DMA transfer.
- Stop conversion of regular/injected channel and disable DMA transfer.
- Start multimode and enable DMA transfer for regular/injected conversion.
- Stop multimode and disable DMA transfer for regular/injected conversion..
- Get result of regular channel conversion.
- Get result of injected channel conversion.
- Get result of multimode conversion.
- Handle SDADC interrupt request.
- Callbacks for calibration and regular/injected conversions.

This section contains the following APIs:

- [\*HAL\\_SDADC\\_CalibrationStart\(\)\*](#)
- [\*HAL\\_SDADC\\_PollForCalibEvent\(\)\*](#)
- [\*HAL\\_SDADC\\_CalibrationStart\\_IT\(\)\*](#)
- [\*HAL\\_SDADC\\_Start\(\)\*](#)
- [\*HAL\\_SDADC\\_PollForConversion\(\)\*](#)
- [\*HAL\\_SDADC\\_Stop\(\)\*](#)
- [\*HAL\\_SDADC\\_Start\\_IT\(\)\*](#)
- [\*HAL\\_SDADC\\_Stop\\_IT\(\)\*](#)
- [\*HAL\\_SDADC\\_Start\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_Stop\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_GetValue\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedStart\(\)\*](#)
- [\*HAL\\_SDADC\\_PollForInjectedConversion\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedStop\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedStart\\_IT\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedStop\\_IT\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedStart\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedStop\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedGetValue\(\)\*](#)
- [\*HAL\\_SDADC\\_MultiModeStart\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_MultiModeStop\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_MultiModeGetValue\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedMultiModeStart\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedMultiModeStop\\_DMA\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedMultiModeGetValue\(\)\*](#)
- [\*HAL\\_SDADC\\_IRQHandler\(\)\*](#)
- [\*HAL\\_SDADC\\_CalibrationCpltCallback\(\)\*](#)
- [\*HAL\\_SDADC\\_ConvHalfCpltCallback\(\)\*](#)
- [\*HAL\\_SDADC\\_ConvCpltCallback\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedConvHalfCpltCallback\(\)\*](#)
- [\*HAL\\_SDADC\\_InjectedConvCpltCallback\(\)\*](#)
- [\*HAL\\_SDADC\\_ErrorCallback\(\)\*](#)

#### 44.2.6 ADC Peripheral State functions

This subsection provides functions allowing to

- Get the SDADC state
- Get the SDADC Error

This section contains the following APIs:

- [\*HAL\\_SDADC\\_GetState\(\)\*](#)
- [\*HAL\\_SDADC\\_GetError\(\)\*](#)

#### 44.2.7 Detailed description of functions

##### **HAL\_SDADC\_Init**

|                      |                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_SDADC_Init<br/>(SDADC_HandleTypeDef * hsdadc)</b>                                                                         |
| Function description | Initializes the SDADC according to the specified parameters in the SDADC_InitTypeDef structure.                                                    |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdac</b>: SDADC handle.</li> </ul>                                                                    |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL</b>: status.</li> </ul>                                                                            |
| Notes                | <ul style="list-style-type: none"> <li>• If multiple SDADC are used, please configure first SDADC1 to set the common reference voltage.</li> </ul> |

##### **HAL\_SDADC\_DelInit**

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_SDADC_DelInit<br/>(SDADC_HandleTypeDef * hsdadc)</b>   |
| Function description | De-initializes the SDADC.                                                       |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdac</b>: SDADC handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL</b>: status.</li> </ul>         |

##### **HAL\_SDADC\_MspInit**

|                      |                                                                                |
|----------------------|--------------------------------------------------------------------------------|
| Function name        | <b>void HAL_SDADC_MspInit (SDADC_HandleTypeDef * hsdadc)</b>                   |
| Function description | Initializes the SDADC MSP.                                                     |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdac</b>: SDADC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                |

##### **HAL\_SDADC\_MspDeInit**

|                      |                                                                                |
|----------------------|--------------------------------------------------------------------------------|
| Function name        | <b>void HAL_SDADC_MspDeInit (SDADC_HandleTypeDef * hsdadc)</b>                 |
| Function description | De-initializes the SDADC MSP.                                                  |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdac</b>: SDADC handle</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                |

**HAL\_SDADC\_PrepChannelConfig**

|                      |                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_SDADC_PrepChannelConfig<br/>(SDADC_HandleTypeDef * hsdadc, uint32_t ConflIndex,<br/>SDADC_ConfParamTypeDef * ConfParamStruct)</b>                                                                                                                                  |
| Function description | This function allows the user to set parameters for a configuration.                                                                                                                                                                                                                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdadc:</b> SDADC handle.</li> <li>• <b>ConflIndex:</b> Index of configuration to modify. This parameter can be a value of SDADC Configuration Index.</li> <li>• <b>ConfParamStruct:</b> Parameters to apply for this configuration.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>HAL:</b> status</li> </ul>                                                                                                                                                                                                                      |
| Notes                | <ul style="list-style-type: none"> <li>• This function should be called only when SDADC instance is in idle state (neither calibration nor regular or injected conversion ongoing)</li> </ul>                                                                                               |

**HAL\_SDADC\_AssociateChannelConfig**

|                      |                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function name        | <b>HAL_StatusTypeDef HAL_SDADC_AssociateChannelConfig<br/>(SDADC_HandleTypeDef * hsdadc, uint32_t Channel, uint32_t ConflIndex)</b>                                                                                                                                                                                                                        |
| Function description | This function allows the user to associate a channel with one of the available configurations.                                                                                                                                                                                                                                                             |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdadc:</b> SDADC handle.</li> <li>• <b>Channel:</b> Channel to associate with configuration. **HAL\_SDADC\_IRQHandler**

Function name      **void HAL\_SDADC\_IRQHandler (SDADC\_HandleTypeDef \* hsdadc)**

Function description      This function handles the SDADC interrupts.

Parameters      • **hsadc:** SDADC handle.

Return values      • **None**

**HAL\_SDADC\_PollForCalibEvent**

Function name      **HAL\_StatusTypeDef HAL\_SDADC\_PollForCalibEvent (SDADC\_HandleTypeDef \* hsdadc, uint32\_t Timeout)**

Function description      This function allows to poll for the end of calibration.

Parameters      • **hsadc:** SDADC handle.

                  • **Timeout:** Timeout value in milliseconds.

Return values      • **HAL:** status

Notes      • This function should be called only if calibration is ongoing.

**HAL\_SDADC\_PollForConversion**

Function name      **HAL\_StatusTypeDef HAL\_SDADC\_PollForConversion (SDADC\_HandleTypeDef \* hsdadc, uint32\_t Timeout)**

Function description      This function allows to poll for the end of regular conversion.

Parameters      • **hsadc:** SDADC handle.

                  • **Timeout:** Timeout value in milliseconds.

Return values      • **HAL:** status

Notes      • This function should be called only if regular conversion is ongoing.

**HAL\_SDADC\_PollForInjectedConversion**

Function name      **HAL\_StatusTypeDef HAL\_SDADC\_PollForInjectedConversion (SDADC\_HandleTypeDef \* hsdadc, uint32\_t Timeout)**

Function description      This function allows to poll for the end of injected conversion.

Parameters      • **hsadc:** SDADC handle.

                  • **Timeout:** Timeout value in milliseconds.

Return values      • **HAL:** status

Notes      • This function should be called only if injected conversion is ongoing.

**HAL\_SDADC\_CalibrationCpltCallback**

Function name      **void HAL\_SDADC\_CalibrationCpltCallback (SDADC\_HandleTypeDef \* hsdadc)**

Function description      Calibration complete callback.

| Function name        | <code>void HAL_SDADC_ErrorCallback (SDADC_HandleTypeDef * hsdadc)</code>         |
| Function description | Error callback.                                                                  |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdacd:</b> SDADC handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul>                  |

**HAL\_SDADC\_GetState**

|                      |                                                                                       |
|----------------------|---------------------------------------------------------------------------------------|
| Function name        | <code>HAL_SDADC_StateTypeDef HAL_SDADC_GetState (SDADC_HandleTypeDef * hsdadc)</code> |
| Function description | This function allows to get the current SDADC state.                                  |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdacd:</b> SDADC handle.</li> </ul>      |
| Return values        | <ul style="list-style-type: none"> <li>• <b>SDADC:</b> state.</li> </ul>              |

**HAL\_SDADC\_GetError**

|                      |                                                                                  |
|----------------------|----------------------------------------------------------------------------------|
| Function name        | <code>uint32_t HAL_SDADC_GetError (SDADC_HandleTypeDef * hsdadc)</code>          |
| Function description | This function allows to get the current SDADC error code.                        |
| Parameters           | <ul style="list-style-type: none"> <li>• <b>hsdacd:</b> SDADC handle.</li> </ul> |
| Return values        | <ul style="list-style-type: none"> <li>• <b>SDADC:</b> error code.</li> </ul>    |

## 44.3 SDADC Firmware driver defines

### 44.3.1 SDADC

***SDADC Calibration Sequence***

|                                      |                                                                                                                             |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>SDADC_CALIBRATION_SEQ_1</code> | One calibration sequence to calculate offset of conf0 (OFFSET0[11:0])                                                       |
| <code>SDADC_CALIBRATION_SEQ_2</code> | Two calibration sequences to calculate offset of conf0 and conf1 (OFFSET0[11:0] and OFFSET1[11:0])                          |
| <code>SDADC_CALIBRATION_SEQ_3</code> | Three calibration sequences to calculate offset of conf0, conf1 and conf2 (OFFSET0[11:0], OFFSET1[11:0], and OFFSET2[11:0]) |

***SDADC Channel Selection***

|                              |
|------------------------------|
| <code>SDADC_CHANNEL_0</code> |
| <code>SDADC_CHANNEL_1</code> |
| <code>SDADC_CHANNEL_2</code> |
| <code>SDADC_CHANNEL_3</code> |
| <code>SDADC_CHANNEL_4</code> |
| <code>SDADC_CHANNEL_5</code> |
| <code>SDADC_CHANNEL_6</code> |

`SDADC_CHANNEL_7`

`SDADC_CHANNEL_8`

#### ***SDADC Common Mode***

`SDADC_COMMON_MODE_VSSA` Select SDADC VSSA as common mode

`SDADC_COMMON_MODE_VDDA_2` Select SDADC VDDA/2 as common mode

`SDADC_COMMON_MODE_VDDA` Select SDADC VDDA as common mode

#### ***SDADC Configuration Index***

`SDADC_CONF_INDEX_0` Configuration 0 Register selected

`SDADC_CONF_INDEX_1` Configuration 1 Register selected

`SDADC_CONF_INDEX_2` Configuration 2 Register selected

#### ***SDADC Continuous Mode***

`SDADC_CONTINUOUS_CONV_OFF` Conversion are not continuous

`SDADC_CONTINUOUS_CONV_ON` Conversion are continuous

#### ***SDADC Error Code***

`SDADC_ERROR_NONE` No error

`SDADC_ERROR_REGULAR_OVERRUN` Overrun occurs during regular conversion

`SDADC_ERROR_INJECTED_OVERRUN` Overrun occurs during injected conversion

`SDADC_ERROR_DMA` DMA error occurs

#### ***SDADC Exported Macros***

`_HAL_SDADC_ENABLE_IT`

##### **Description:**

- Enable the ADC end of conversion interrupt.

##### **Parameters:**

- `_HANDLE_`: ADC handle
- `_INTERRUPT_`: ADC Interrupt This parameter can be any combination of the following values:
  - `SDADC_IT_EOCAL`: End of calibration interrupt enable
  - `SDADC_IT_JEOC`: Injected end of conversion interrupt enable
  - `SDADC_IT_JOVR`: Injected data overrun interrupt enable
  - `SDADC_IT_REOC`: Regular end of conversion interrupt enable
  - `SDADC_IT_ROVR`: Regular data overrun interrupt enable

##### **Return value:**

- None

`_HAL_SDADC_DISABLE_IT`

##### **Description:**
